No. 1.

## ON A PORTRAIT OF COLUMBUS.

**W**AS this his face, and these the finding eyes  
 That plucked a new world from the rolling seas?  
 Who, serving Christ, whom most he sought to please,  
 Willed his one thought until he saw arise  
 Man's other home and earthly paradise—  
 His early vision, when with stalwart knees  
 He pushed the boat from his young olive-trees,  
 And sailed to wrest the secret of the skies?

He on the waters dared to set his feet,  
 And through believing planted earth's last race.  
 What faith in man must in our new world beat,  
 Thinking how once he saw before his face  
 The west and all the host of stars retreat  
 Into the silent infinite of space!

NEW YORK, Feb. 18, 1892.

*George E. Woodberry.*

## THOMAS COUTURE.

WITH PICTURES BY THOMAS COUTURE IN THE COLLECTION OF F. BARBEDIEUNE.

Y first meeting with Couture, who became one of my best and dearest friends, was odd and characteristic. It was in 1834; I was not yet one and twenty, and had just arrived from the United States, well provided for in the way of courage and determination, with a goodly stock of youthful illusions, and very little besides. I was just beginning to understand a few words of French, and had entered the studio of the great and unfortunate painter Gros. If I understood but few of the things the master and pupils said to me, I understood the language of the pencil, and worked all the harder that I was more estranged.

One day, as the model was resting, and I was looking at my morning's work in a somewhat melancholy state of mind, a short, thickest young man, with bright brown eyes and shaggy hair, unceremoniously pushed me aside, saying, "Donne moi ta place, petit." I was going to protest, when I saw my fellow-student so absorbed that I grew interested in what he was doing. He coolly turned over my sheet of gray paper and sketched the model, who, resting, had fallen into a far better attitude than that which we had copied. The outline drawing was so strong, so full of life, so easily done, that I never received a better lesson. When he had finished, he left my place as coolly as he had taken it, seemingly quite unconscious of my existence.

I did not then know the name of this free-and-easy comrade, but I kept the drawing and prized it. I am sorry to say that the woman intrusted with the care of my room had but small respect for the fine arts, and being one day in need of paper to light my fire, took a number of drawings for that purpose. Among those drawings was the outline sketch by Thomas Couture.

I was scarcely able to profit much by my illustrious master's directions. Baron Gros had been a very successful as well as a very great painter. His "Battle of Eylau" and his "Plague of Jaffa" at the Louvre show what he was capable of doing. But little by little fashion changed; other painters became the favorites of the moment, and Gros was left somewhat in the background. There are but few sorrows more cruel than such a sorrow — to feel one's own power; to know that one's rivals are less truly artists than one's self; and yet to assist, powerless, at

the crumbling away of one's own fame. And, as often happens, the very public, so eager formerly to praise, seems to find a cruel delight in throwing mud at the fallen idol. The criticisms which were not spared Baron Gros when his last picture was exhibited at the Salon so cut him to the heart that he threw himself into the Seine. His body was found near Saint-Cloud.

Gros's pupils dispersed, and I had no opportunity to make further acquaintance with my eccentric fellow-student.

Some years later, when the estranged boy that I was in 1834 had become a young man, I happened to pass with a comrade, a young Englishman named Coplis, near the shop of Desforgés, who sold canvases and paints, and who also exhibited pictures in his window. I was greatly struck by a picture representing a young Venetian, and endeavored to excite my companion to enthusiasm. Coplis was hungry, and at first thought more of his delayed lunch than of the painting. But he soon forgot his hunger, and exclaimed, "By Jove! I must get my brother to buy that." Lucky fellow! I had a certain respect for a painter whose brother was rich enough to buy pictures. In those days painters were by no means able to build their own grand studios, and to fill them with wonderful draperies and precious bric-à-brac; as a usual thing, they belonged to modest families, who mourned over the son and brother who had embraced such a profession.

Mr. Coplis bought the picture signed Thomas Couture, and paid the color-dealer a thousand francs for it. I afterward found out that the artist received only three hundred francs. As it happened, it was I who was commissioned to go to his studio. As soon as I entered I saw that Couture was no other than the fellow-student who had so unceremoniously taken my place. I was so delighted at the coincidence that Couture, who naturally did not recognize me at all, thought me a little crazy. I exclaimed, "I am so glad that it is you!" I must now confess a little weakness of mine. When I am excited and pleased by any unexpected event, I rather enjoy the bewilderment of those who are not in the secret. After all, each must find his pleasure where he can. But after a while Couture understood that I was not the rich amateur who had bought his picture, but only a poor devil of a painter like him-

THE LITTLE CONFECTIONER.

ENGRAVED BY H. DAVIDSON.

self, and that we both had been pupils of Gros. Our friendship dated from that moment.

There was in Couture's talent such vigor, such frankness, so much of life and truth, that my admiration for the artist equaled my liking for the man. He was apart among the painters of the day; as far removed from the cold academic school as from the new art, just then making its way, with Delacroix at its head. The famous quarrel between the classical and the romantic camps left him indifferent. He was, even then, of too independent a nature to

by the wayside, a goatskin about his loins his only garment, thin, his deep-sunken eyes full of despair, his brow overshadowed by a thick shock of black hair, seems to ruminate over his past follies and their consequences. In the background pass a man and a woman: the young woman is full of compassion, while her companion points to the prodigal and seems to tell his story. The contrast between the prodigal son and these lovers is very happily indicated; and the rich tones of the man's red drapery relieve the somberness of the rest of

STUDY FOR "THE LOVE OF GOLD,"

ENGRAVED BY M. HAIDER.

follow any chief, however great. He was—himself. His great aim was to approach nature as near as possible, to give life and passion to his painted figures. And in that he succeeded wonderfully.

On that first visit of mine to his bare studio—a very different-looking place from the lovely boudoir-like studios of fashionable painters nowadays—I saw him at work on a picture only just sketched in. He exclaimed: "The amateur who will buy that canvas for a thousand francs will have his money's worth. Don't you think so?" A thousand francs! The picture was large, and represented the prodigal son, a life-size figure. The young man, seated

the picture. While examining the sketch I said to my new friend: "My sitters pay me a thousand francs for a portrait. If you will allow me to pay you by instalments, I will be that amateur,—and a proud one too,—and I offer you not a thousand francs, but fifteen hundred."

I was very proud of my purchase, but a little troubled too. In those days my sitters were not very numerous, and I borrowed of Mr. Coplis, the brother of my fellow-student, the first sum paid to Couture. But I never regretted this youthful folly of mine. "The Prodigal Son" remained in my studio for many years, and I took it with me to America. Finally I gave it, with many other

ADVOCATE PLEADING.

pictures, to the city of Chicago. I am sorry to say that the whole collection was destroyed in the great fire of 1871. A small sketch of "The Prodigal Son," and a most spirited one, still exists; it belongs to M. Barbedienne, the famous bronze-dealer, who was a personal friend of Couture, and possesses a number of pictures, drawings, and sketches by the master.

Thomas Couture was of humble origin, and had to fight his way in life; he fought it bravely and successfully. He was born in Senlis, not far from Paris, on the 21st of December, 1815. Sturdy, thick-set, short, with a big voice and somewhat rough manners, he was by no means what is called a "lady's man." He never frequented society, and had a profound contempt for those who did. He was a great worker, in his youth especially, for later he grew much fonder of his ease. He cared only for the life of the studio and for artists' jokes, and, I am sorry to say, practical jokes were his particular delight.

If he had not been a painter, he might have been a most inimitable comic actor. When he told a story (and he told funny stories by the dozen), he would act it; his face would turn and twist, his eyes would dance, his nose, with its peculiar nostrils opening upward, would sniff, and he managed so admirably to render the tone

of voice and the gestures of those he imitated that he actually looked like them. I remember that many years later, happening to speak of a very fussy old lady whom we both knew, and whom he had known when she was young, he so caught the twist of her head, the pleading of her eyes, the flattery of her society phrases, that I saw her before me, and not only as she was then, but as she must have been twenty or thirty years before.

Couture was a stanch and faithful friend. We were often separated, as I continually went to America or to England; but when I returned to Paris I was sure to find my old comrade such as he had been when we parted. When I married, and presented him to my young wife, the impression was not so favorable as I should have liked. His big, loud voice, his free-and-easy manners, and especially his practical jokes, which he did not always reserve for the painting-room, greatly disturbed the shy young Englishwoman. At one time he never came to dine with us without bringing in his pocket a tame lizard, which would run up his back and nestle against his neck, or would play the same trick with unsuspecting strangers. He did his best to inspire a disgust for oysters by showing the creatures to be living at the moment when they were swallowed. Many other

ENGRAVED BY CHARLES STATE.

HARLEQUIN PLEADING.

such trifles were set down against him at first ; but with time, and especially after he himself, rather late in life, married, these eccentricities were softened down, and his real sterling qualities—the good heart, the faithfulness, the sturdy courage, and the manly energy—grew to be more thoroughly appreciated.

These strong qualities did not go without a certain rough independence of character which did not help him to success and official dignities. He divided the world into two distinct classes: artists,—that is, those whom God created to be the masters of the world,—and the others, whom he called with infinite contempt “les bourgeois.” The greatest statesmen, kings, noblemen, or shopkeepers were all bourgeois,—that is, inferior beings, who should consider it an honor to buy pictures or statues at the highest possible rates. As to allowing them a voice in the matter, the right of directing in any way the artist they employed, that was not to be thought of. Their first duty was to be eternally satisfied, grateful, and enthusiastic.

At the time that Guizot published his work on Washington I was commissioned by a group of Americans to paint a portrait of the great statesman. The sittings were most agreeable, and conversation between the painter and the sitter never flagged. I happened to mention Couture, and I spoke so warmly of my fellow-student that Guizot expressed a wish to see him. The picture of “The Prodigal Son,” which he had admired during his sittings, proved to him that my enthusiasm was not inspired merely by friendship. We therefore went together to Couture’s studio. He had utilized one of his bare walls to sketch in the picture which was to become so celebrated under the title of “The Romans of the Decadence.” Even in that rough state it was easy to see what a strong work it was, and the visitor was very much struck by it. Guizot was then all-powerful, and a more courtier-like painter would have shown himself more flattered by this visit than did Couture; he considered it but his due. When the statesman asked him whether he had no order for this picture, he answered, “J’attends.” The orders should come to him; he would never run after them. Guizot smiled, but continued most graciously:

“Who was your master?”

“Delaroche.”

After the death of Gros, Couture had entered Delaroche’s atelier, but remained only a short time under a master whom he did not admire.

“M. Delaroche is a friend of mine,” answered Guizot; “I shall have great pleasure in speaking of you to him.”

And he evidently did speak to Delaroche of his pupil, for a short time after this visit

Couture happened to meet his old master, the most successful artist of the day, the favorite painter of Louis Philippe and of all his family. Delaroche went up to him and said:

“M. Guizot seems to have been struck by your work; he told me so. I replied that you had been my favorite pupil, you had natural talent, but you have strayed from the true path, and I cannot recommend you.”

Probably the favorite court-painter influenced his royal patrons, for when the “Decadence” was exhibited at the Louvre—in those days the “Salon” took place in the long gallery, the modern canvases hiding the works of the old masters—the King, Louis Philippe, when he visited the exhibition, managed to turn his back on Couture’s picture, both in coming and in going. The painter’s contempt for “bourgeois” taste by no means kept him from feeling this royal behavior most keenly. However, the picture had such great success, was so generally praised, suddenly causing its author to become famous in a day, that the state bought it for the very large sum of 6000 francs. This sudden reputation of his ex-pupil probably caused Delaroche to modify his judgment. At any rate, he called on Couture some time after the purchase of his picture, and said:

“Monsieur Couture, I have greatly disapproved, I still disapprove, of your conception of art, but I do not deny that you have talent. You have made for yourself a place in art; let us be friends.”

But Couture was not a man to be taken by a few pleasant words; he drew back and answered:

“Monsieur Delaroche, you have had immense success, you are a member of the Institute, you have innumerable admirers. I never was, I never can be, among those admirers. Therefore there can be no question of friendship between us two.”

And, bowing, he left the great man somewhat astonished at this manner of responding to his advances.

Couture was a good painter, but a very bad courtier; he proved it every time he was placed in contact with the great ones of this world, whether sovereigns or members of the Institute of France. That was not the way to make of his talent a popular talent. The rough independence of his nature could admit of no sort of compromise. He had several opportunities of making his way to honors and to fortune—opportunities which another might have utilized, but which he wasted. Doubtless he made good resolutions, but when the time came he was unable to control his impatience and his sharp retorts.

If Louis Philippe did not appreciate the painter of the “Decadence,” his reputation was

ENGRAVED BY T. JOHNSON.

STUDY OF AN AMERICAN GIRL. (MADE IN ONE SITTING.)

so well established when Napoleon III. took possession of the throne that it was impossible to treat him slightly, though Couture's talent was not such as courts, as a usual thing, care to encourage. The favorite painter of the Third Empire was Winterhalter, as Delaroche had been of the Orleans family. However, an order was given to Couture for a large picture representing the baptism of the little Prince Imperial. He went to work with great ardor, making sketches, and preparing a vast composition. In the course of the work he had to have sittings from the various members of the imperial family and their immediate followers. If a portrait-painter, when his sitters are ordinary mortals, has nearly always to undergo many unpleasant scenes, it is easy to judge how his temper is tried, and his nerves unstrung, when those sitters are princes or sovereigns. It is

likely that in Couture's case the sittings were not agreeable either to the painter or to his models. Napoleon III. wished to direct his artist, and of all artists Couture was the least easy to direct. Finally, one day, goaded beyond endurance, the painter turned around and said:

"Sire, who is to paint this picture — your Majesty, or I?" And neither painted it! The Emperor gave no more sittings, turned his back on the painter, and his courtiers turned theirs also. The order was not maintained, and all the work of many months was wasted.

Couture never recovered from this bitter disappointment. He shook the dust from his feet, and returned contempt for contempt. From that day on he never sent any work to the annual Salon, and, little by little, so retired from the world that many thought him dead. For many of his contemporaries he remained the

painter of the "Decadence," as though he had painted only that one picture. How many times have I not heard young painters exclaim: "Couture—ah, yes, Couture of the Romans. But he died ages ago. Or, if he still vegetates somewhere, he must be very old indeed. No one has heard of him for many a long year!" In reality, when Couture died, in March, 1879, he was not thirty-four years of age.

The truth is that Couture never ceased working, though he worked after a somewhat irregular fashion, giving himself numerous holidays. If he was neglected by the great mass of his countrymen, he was appreciated elsewhere. One of his most charming works, the "Falconer," of which I made a copy the size of the original, is in Germany. But most of his pictures were bought, I am glad to say, by Americans. It is rather odd that the "nation of shopkeepers," as ours is often termed, should have a love of art, and the instinct of the real amateur, more fully developed than many an Old World country. When Millet was still, if not unknown, at least violently criticized in France, America already possessed some of his best works. Barye found his most fervent admirers in the United States. Couture painted almost exclusively for Americans.

Couture married rather late in life, and had two children, both girls. He was adored by his wife and daughters, and his married life was a very happy one. Perhaps, with our ideas on such matters, we might consider that his theory of the superiority of the male creature, and his right to absolute devotion on the part of his womenfolk, was a reprehensible theory. But he made an excellent father and husband in spite of his conviction that a man was not made to be faithful to one woman, and that education for girls was a dangerous modern notion, not to be encouraged by a reasonable man.

In 1869 he purchased a country place at Villiers-le-Bel, a short distance from Paris. The house dated from the time of Francis I., and the garden, or rather park, was filled with grand old trees. Here he resided during the last ten years of his life, going to Paris only during a few months in winter. His peculiar ideas of happiness caused him to live in what other mortals might consider great discomfort. Under pretext that nature managed things for the best, he never allowed a gardener to work on his grounds. He was, besides, quite convinced that such hirelings made it a point to sell his vegetables and to steal his fruit. As a natural consequence the beautiful place went to ruin; the trees brought forth no fruit, and the earth yielded no vegetables. He himself took great delight in wearing peasant's garments and in walking in *sabots*—they at least had nothing to do with civilization! But as he had a thorough appre-

ciation of the delights of a good table, he employed an excellent cook, and his devoted wife took care that his meals should be of the best and his truffles of the largest. But for the rest of the service a village girl was quite sufficient, and he deemed it by no means beneath their dignity to utilize his wife and daughters in domestic duties of the most active sort.

In his country retreat he was not, however, abandoned. Pupils gathered about him, living in the village so as to profit by the master's advice. Among these were many Americans. Mr. Ernest Longfellow, son of the poet, was of the number. Couture was an excellent master, and took great interest in the progress of his pupils. His great precept was, "Look at nature; copy nature." He published a little book full of good advice to young artists, giving the result of many years' experience. All his pupils were fond of him, which proves that the exterior peculiarities which sometimes shocked strangers were soon overlooked by those who were able to appreciate his sterling qualities. A man who is loved by the members of his family, to whom all his friends remain faithful, and who is appreciated by young people, is sure to be of a thoroughly lovable nature. Still, it must be owned that the first impression was not always quite agreeable. On one occasion an American, a rather shy and exquisitely polite gentleman, and a great admirer of Couture's talent, went, provided with a letter of introduction, to pay his respects to the master. The master was in his bath, but when his wife told him of the visit, "Let him come in!" exclaimed he, and, much to our countryman's confusion, he was received by Couture, soaking placidly in his bath. He rather splashed his visitor, for, like many Frenchmen, he gesticulated freely while conversing.

Couture was fond of telling the story of his first pupil. He was still a young man when, one morning, he heard a timid knock at his door. "Come in!" said he, in that big, gruff voice of his, scarcely calculated to encourage shy visitors. A young fellow, slightly deformed, dressed like a well-to-do countryman, entered, and, not without much hesitation and much stuttering, begged the painter to take him in as pupil. "I have no pupils; and I wish for none," was the discouraging answer. But the youth, if he was timid, was tenacious; he would be so discreet; his master need not feel his presence; all he asked for was a corner of the atelier from which he could see the great artist at work; he would make himself of use, wash the brushes, set the palette, run errands—do anything, in short, that was required of him. Couture continued to say no; the young man continued to plead. Finally the artist impatiently took up his pipe and found that his tobacco-pouch was

empty. "Go and buy me some tobacco!" he cried. The young man disappeared, reappearing soon; Couture smoked, was mollified—and yielded.

This strange pupil remained with him for more than a year. Couture often wondered how he managed to live. He seemed poor, but he never borrowed money. He spent all his time working, without showing very great natural talent, and Couture's excellent heart was much concerned. How was that poor fellow ever to get salt for his porridge with his painting?

One day the pupil begged a great favor of his master—to let him invite him to dinner. Couture consented, and, to his amazement, the young man, dressed like a gentleman, took him to the best restaurant in Paris and ordered the best dinner that restaurant could provide.

The poor, humble pupil, who ran on his errands and washed his brushes, was a very rich amateur whose passion for painting had led him to seek the sincere and disinterested lessons of a master he admired. Later, Couture went to visit his ex-pupil in the latter's beautiful château in Normandy, which contained one of the finest collections of pictures and rare curiosities in all France. It is needless to say that the master was received with enthusiasm by the pupil. M. Dutuit (the pupil) left his magnificent collection, with a large endowment, to the city of Rouen. One of the pictures is a small whole length of Rembrandt, which I once copied.

Couture's method of giving a lesson to his pupils was as follows: While they looked on

he painted a head from the model, and while he painted made judicious remarks as to the drawing, the color, the light and shade. Some of these heads, dashed off in two hours, are charming. M. Barbedienne, Couture's great friend and admirer, possesses several of them.

In the same collection are numerous drawings, sketches, half-finished pictures, most interesting to those who like to follow the workings of an original genius. Among these is the sketch for his picture, the "Love of Gold." Seated at a table, a man with a fiendish face grasps bags of gold, jewels, and precious stones; crowding about him, eager for the spoil, we see beautiful women, writers willing to sell their pen, artists their brushes, warriors their valor. Couture's love for symbolical painting grew with years, developed probably by solitude. In the very retired life which he led he did not follow the movement of modern art; he even refused to see what other artists did, declining to let them see his own works. Another of his symbolical pictures, of which M. Barbedienne possesses a large, nearly finished sketch, shows us a beautiful young woman seated in a carriage, whip in hand, driving, instead of horses, a group of men—among them a poet, a warrior, and a satyr-like old lover. I prefer, as a general thing, his simpler works. Among these I must speak of a little picture representing a boy carrying a tray on which are glasses full of wine or red syrup; his head is covered with a sort of white twisted cloth, and is singularly living and strongly painted. Couture's love of symbolical pictures sometimes carried him to the verge of caricature, as in his series of pictures

DRAWN BY MALCOLM FRASER,

THE HOUSE OF COUTURE AT VILLIERS-LE-BEL.

FROM A PHOTOGRAPH.

of lawyers. He had two pet hatreds — lawyers and doctors. In M. Barbedienne's gallery are some very spirited drawings and sketches of lawyers speaking before the court, or sleeping during the discourse of their brother lawyers. As to doctors, he never would allow one in his house. He was so violent in his animosity that, when he fell ill, he refused all medical aid. And his was a terrible sort of disease, which could not be cured, although his sufferings might at least have been somewhat allayed.

My poor friend died of a cancer in the stomach on the 27th of March, 1879. His loss was a great sorrow to me. We had been young men together; we had seen years roll on without bringing any change in our mutual feelings, and when one of us experienced some success in life it was a joy to the other. For his talent I had a sincere and profound admiration; for his strong and manly nature the greatest sympathy. He was a friend in the broadest and best sense of the word.

*George P. A. Healy.*

"BECAUSE IT IS THE SPRING."

"I will be glad because it is the spring." AMY LEVY.

SHALL I be glad because the year is young?  
 The shy, swift-coming green is on the trees;  
 The jonquil's passion to the wind is flung;  
 I catch the May-flower's breath upon the breeze.

The birds, aware that mating-time has come,  
 Swell their plumed, tuneful throats with love and glee;  
 The streams, beneath the winter's thraldom dumb,  
 Set free at last, run singing to the sea.

Shall I be glad because the year is young?  
 Nay; you yourself were young that other year:  
 Though sad and low the tender songs you sung,  
 My fond heart heard them, and stood still to hear.

Can I forget the day you said good-by,  
 And robbed the world and me for alien spheres?  
 Do I not know, when wild winds sob and die,  
 Your voice is on them, sadder than my tears?

You come to tell me heaven itself is cold,—  
 The world was warm from which you fled away,—  
 And moon and stars and sun are very old—  
 And you?—oh, you were young in last year's May:

Now you, who were the very heart of spring,  
 Are old, and share the secrets of the skies;  
 But I lack something that no year will bring,  
 Since May no longer greets me with your eyes.

Can I be glad, then, in the year's glad youth?  
 Nay; since for me the May has ceased to shine.  
 What shall I do but face the cruel truth?—  
 You made my spring; and now spring is not mine.

*Louise Chandler Moulton.*

WAITING FOR A BREEZE. (FROM A PHOTOGRAPH BY WALTER BLACKBURN.)

## COAST AND INLAND YACHTING.

**L**ACH advancing year makes more apparent the universality of a taste for aquatic sports among the American people. Yachting has ever been a growing pastime by the waters of the North Atlantic coast. We now find white sails in the least-expected places: yachts and yachters where but a few years ago the only sailers were the timid wild duck and the solemn mud-hen; boats upon waters that have scarcely ceased to ripple from the agitation of their first invasion by a launched vessel; butterfly canoes scudding over rivers that not a decade since knew no alien thing save the Indian's dugout; lakes upon which float shapely vessels of pattern so modern that they almost seem uncouth in their intrusion upon Nature's primeval landscape; sloops and cutters, schooners and cat-boats, every kind of sailing craft in short, that can be made to cater to the yachter's insatiate desire for sport. In yachting the United States takes first rank; her yachts and yachters outnumber and outsail those of all other countries. Few among the "land-lubbers" of the country, and not many yachters, realize the magnitude of this national pastime. The Queen's Cup races gave the sport a publicity which it never had before, but even these events did not bring to general public notice an adequate conception of the extent of this interest.

It is safe to estimate that there is at least one yacht to every ten thousand people in the land, and that an average yacht will carry at least ten persons. This means that there are at least six thousand yacht-owners in the country, and that sixty thousand people may participate in pleasure-sailing: a large number, surely, to be devoted to a sport which is necessarily confined to localities near the water, and which is an expensive pastime. The public hears much of vessels of the *Volunteer* and *Grayling* types, champions of the "big-boat" classes, but the real yachters of the land are the owners of small boats; in fact, the big-boat owner gener-

ally keeps a small yacht in which to enjoy himself when he feels like being master of his own craft. A few statistics will render this quite plain.

Figures that are somewhat incomplete show that there are over 200 organized yacht-clubs in the United States, which enroll nearly 4000 yachts. Of these, less than one thirteenth are steam vessels, launches, etc., and not sailing-boats at all. One eleventh are classed as large yachts, including many steam and sail vessels, big schooners and sloops, all of more than forty feet water-line measurement. That is to say, of 4000 recorded yachts, five sixths are sailing vessels under 40 feet. This shows conclusively that the majority of American yachts are small boats that are managed by their owners. It is safe to assert that there are at least 2000 more small yachts which are not entered in clubs, and of which no exact record can be given.

The 200 clubs report a membership of over 7000 men, 4000 of whom are yacht-owners. Leaving out one sixth of them as owners of large and very costly vessels ranging in value from \$5000 to perhaps \$500,000 each, and assuming the average cost of the small yachts to be about \$1000, which is a low figure, one finds that five sixths of these 4000 yachts represent an invested capital of over \$3,300,000: a large sum when it is remembered that yachts never pay back anything in profit to their buyers, and that, like horses and carriages, they eat up a good deal of money all the time. The average dues, etc., of a yacht-club are about \$25 a year, not counting extras. This, paid in by 7000 members of clubs, shows a revenue of \$175,000 per annum, which really represents no part of the great cost of yachting, for every yacht-owner has to pay his own expenses, and the club dues are spent on shore. At a very low estimate the owner of a small yacht will spend \$50 a month during the season of about five months. This means that the small-yacht sailers of the country spend at least \$800,000 in a sea-

son. How much their yachting costs the owners of the big boats it would be impossible to state; the sum is enormous.

A glance at the distribution of the yacht-clubs of the country will not be uninteresting, even to old and well-informed yachting men, and will prove beyond question that American yachting, like American education and American politics, is not the especial prerogative of any part of the country. A map of the United States will show that in certain regions there are lakes, many of which are not little ponds, such as charm the eye of the tourist in foreign lands, but large bodies of water admirably adapted for the sailing of yachts; and investigation proves that the yachts are there. Passing for the present those freshwater seas known as the Great Lakes, and directing attention to smaller and less generally known fresh waters, we find a lively interest in sailing in Minneapolis, whose people support a flourishing club of 200 members. Their fifty boats, some of them of the best Eastern design, ply from the clubhouse on Lake Minnetonka, which has an irregular shoreline nearly a hundred miles in the circuit. There is yachting also on the White Bear Lake near St. Paul, although no club exists there. In Wisconsin, in addition to the yachting interests on the borders of Lake Michigan and Green Bay, there is a club at Oshkosh, on Lake Winnebago; another at Oconomowoc, on La Belle Lake; and a third at Tomahawk Lake. These yacht-clubs of two States are represented by an average of 40 boats each, which is as good a showing as some of the oldest clubs of New York harbor can make.

Upon the lakes which form the central New York group there are yachts innumerable, and of every type known to the boat-sailer. The yacht-lovers of that region maintain three large and well-equipped clubs, whose members sail those often perilous waters; for lake-sailing is no boys' play, and one who would handle a yacht in treacherous inland waters must be a good sailor indeed, or his sailing time may be short. Lake George, because of its treacherous winds, was until recently considered unfit for sailing, and twenty years ago a sail-boat was rarely seen upon its waters. The trouble

was that the only sail-boat known there was that most dangerous compound of two very different ideas, the rowboat with a sail. But proper principles in building have made it possible for the yachter to use the waters of this mountain-bordered lake, and a successful club has been established.

Lake Champlain is one of the most delightful yachting grounds anywhere away from the sea. At Burlington, on the Vermont shore, there is a large and ambitious yacht-club. Many of the earlier Champlain yachts were vessels bought in New York harbor, and thence towed up the Hudson River, and through the canal to the lake. In the once desert wastes of Utah is a remarkable body of water, the Great Salt Lake, upon which a few sloops and catboats, as well as steamers and rowboats, are to be seen.

DRAWN BY W. TABER, FROM A PHOTOGRAPH BY WALTER BLACKBURN.

ENGRAVED BY C. SCHWARZBURGER.

OFF FOR A CRUISE.

The lake is about seventy-five miles long, has many islands, and is a good sailing ground, except that the yachter must be wary of spray from the bow, since the water is so strongly charged with chemicals that a drop of it in the human eye will cause pain and inflammation.

Upon the five great lakes which form the chain of waterways from Duluth, Minnesota, to Kingston, Canada, floats a yachting fleet which is equal in all points of excellence to any in the world. These tempestuous freshwater seas are of uncertain temper, like the North Atlantic, and none but doughty seamen may go upon them in safety. Cleveland and Detroit, Milwaukee and Erie, each has its well-

DRAWN BY W. TABER,

NEWPORT CATBOAT.

established club; Rochester has one, and Toledo and Kingston have two each, while the great clubs of Chicago and Buffalo are as well known in the yachting world as are many of the most popular clubs of New York and Boston. And besides, many yachts are to be found on the waters of Green Bay, the Georgian Bay of Canada, and some of the smaller bays and river-mouths along the coast of the lakes.

On the American side of the Great Lakes every kind of craft may be found, many of them built from designs by eminent yacht-architects. The sailor of the Great Lakes has little chance for his life in a storm if his boat be poor, since harbors of shelter are few and far apart, the winds violent, and the waters rough. The Canadian yachters of the Great Lakes use powerful boats, cruise far, and face bad weather bravely. Their favorite yacht is that of their home country, the cutter, although one will find other types in their fleets. They have two clubs at Kingston, three at Toronto, and one at Hamilton. At Montreal and Quebec there are clubs whose boats cruise the St. Lawrence. There are also two sea-coast Canadian clubs, one at Chatham, New Brunswick, and the other at Halifax, Nova Scotia. The members of these latter clubs use only stanch sea-boats, for the coast off which they cruise is a perilous one for all vessels. The yachters of the Canadian sea-coast are no fair-weather sailors, but boating men of the ablest sort.

Formerly the South took little interest in yachting. In recent years, however, this sport has taken a strong hold upon the people of that

region, and to-day the coast waters from the Carolina line to Galveston, Texas, are well supplied with sailing pleasure-boats. Most of the Southern yachts are of light draft, for the waters of the South are shallow; and the number of flat-bottomed and very shoal round-modeled yachts far exceeds all other types. On the inlets of Florida and along the Gulf of Mexico the craft of the pleasure-seeker may be seen all the year round, for there is no beginning or end to the Southern yachting season. Though yacht-clubs are not numerous in the South, North Carolina has two, South Carolina one, Maryland two, Louisiana one, Alabama one, Georgia one, and Florida maintains three. There is also a club in prospective at Galveston, Texas. Some of these Southern clubs are strong in membership; the New Orleans club, whose yachts sail upon Lake Pontchartrain, is notable for the number and standing of its members.

The yachts chiefly used in Southern waters are, as has been stated, light-draft vessels of the generally accepted types which have been developed in the North. Sloops and cat-rigged boats are in the majority; but schooner-rigged sharpies are popular with those who like yachts of good size, and the builders of vessels of this type find a ready market for their boats in the South. The only type of yacht which is of Southern origin is the buckeye, or, as it is sometimes called, "bugeye," a vessel which tradition says was first conceived by the dug-out builders of the Dismal Swamp, and which will be described more fully later on.

Some Americans belong to the Havana Yacht Club, an organization of several years' standing, whose members cruise among the West Indies, a most seductive sailing ground. Among the yachts of this club are many boats which were built in New York, Philadelphia, and New England, and have made the voyage to Cuba, never to return; for well-built yachts, it is said, find a ready sale at Havana and in other parts of the West Indies. At Bermuda there is no

THE BUCKEYE.

THE SHARPIE.

club, but yachtsmen are numerous. Schooners and cutter-rigged craft prevail, the keel type of boat being the favorite. Small, light-draft boats are also in use there for pleasure-sailing. Many of them are built in New York and shipped by steamer to Bermuda and the West Indies. Among these is a style of narrow, crank boat, generally open, square-sterned, and modeled much after the pattern of what is known as a "cargo-boat," and equipped with a centerboard and a pole-masted rig. These boats are popular as "flyers," but can be kept right side up only by alertness and skill in the handling. They carry no ballast, the crew sitting "hard to windward" to keep them "on end." For dare-devil sailing such boats, like the narrow canoe, are just the thing, but they scarcely deserve the dignity of being called yachts.

On the Pacific coast, throughout the whole range of the sea-board, from the tropical waters of Lower California to Puget Sound, wherever there is a bay that will afford harbor, and a town that will support people, the yacht is used as a vehicle of pleasure. The number of organized clubs on the Pacific coast is small, but the clubs which have been formed there are all strong in membership and active in yachting. San Francisco, of course, takes the lead with two very good clubs and a fleet of yachts that would not shame any seaport town of the East. Many of the San Francisco boats are large schooners, a number are powerful sea-going sloops, while of smaller craft there is an abundance of almost every type, although the New York catboat and the flat-bottomed sharpie of Long Island Sound are seldom met with, and seem not to be in favor. The keel cutter has its representatives in the harbor of the Golden Gate, and the yawl-rigged boat is very popular, perhaps the favorite above all other

types. Pacific yachters appreciate the good points of the yawl, for the squalls which blow over the waters of the west coast are sudden and severe, and no rig meets these conditions of weather so well as does the yawl. There is also a flourishing organization at Tiburon. At Tacoma, in Washington, there is a club whose yachts fly their pennants upon the waters of Puget Sound, and cruise as far north as the British dominions. No other organized clubs exist on the Pacific coast; but private yachts are kept in many places, notably at Santa Barbara, San Diego, and Oakland, in California, and it is predicted that the near future will witness the formation of a Pacific coast yachting fraternity similar in principle and purpose to the New York Yacht Racing Association of the East. The day is not far off when these and associations of the clubs of the Great Lakes and those of the South will concentrate the American yachters in four grand divisions. Then may be formed the American association of all yachters which some optimistic yachting men desire.

From the organization in 1844 of the first band of pleasure-sailors, the New York Yacht-Club,—whose anchorage at Hoboken, New Jersey, was the scene of the first club regatta ever held in America,—the progress of the Eastern yachter has been steady; until to-day the yachting investment of the Atlantic coast is beyond a doubt the most important aquatic interest in the world. It is in the East that the problems of yachting have been propounded and solved. The distribution of yacht-clubs over the Eastern waters is uniform, and every-

A "SANDBAGGER" SLOOP.

where in accord with the availability of the sailing grounds. There are clubs enough, and not too many; these clubs are forming alliances which lead to harmony and good feeling throughout the whole fraternity, and their opportunities are boundless, for they have at their doors every outlet that a yachter can desire. There is inland water on the innumerable bays which everywhere indent the coast; there

yachts innumerable, and the sail-boats of many rowing and canoeing clubs, the total composing a fleet of pleasure-craft greater than that of any other part of the world.

Concerning the craft used by the yachters of the East it will be needless to speak, excepting in a general way. In the mass of vessels which make up the total of their squadron of yachts may be found every kind of boat, from the great steamer, which is really an "ocean greyhound" in appearance and speed, to the modest little skipjack. There are cutter and sloop, schooner and yawl, sharpie and sand-bagger, each filling its place, and all getting on very well together. The center-board boats of course outnumber the keel boats, and the sloops outnumber the cutters; but there is no especial type of yacht which can be said to be the distinguishing Eastern style. Everything is in use, and it is safe to assert that everything new will be tried and, if found good, adopted by these masters of the art of sailing.

The earliest form of yacht was, of course, a rowboat with a sail. This in time gave way to the wider-beamed boat with greater sail-carrying ability and a center-board. With the adoption of the center-board the era of American yachting really began. The steady improvement of center-board models, and the importation from England of the cutter type of narrow, deep-keeled boats, furnished yacht-builders and -designers with material for thought and experiment during many years; and their endeavors to improve are not less earnest to-day than they have been in the past. From the primitive sprit-sail pleasure-boat comes the ever-present and universally favored center-board catboat, a type of yacht which for speed, handiness, and unsafety has never been surpassed. Keel catboats are also built, but the typical American "cat" is the center-board boat of light draft, big beam, and huge sail. The two objectionable points about boats of this class are their capsizability, and their bad habit of yawing when sailing before the wind. Yet the cat is the handiest light-weather boat made. It is very fast, quick in stays, and simple in rig; but it can never become a first-class seaworthy type of yacht. It belongs among the fair-weather pleasure-boats, and is

FROM A PHOTOGRAPH.

are great rivers upon which the lover of natural scenery may sail his boat; deep waters for the cutter-lover, and shoal inlets and sounds for the advocate of the sharpie; Long Island Sound gives the short cruiser a field for his water rambles such as can be found nowhere else on the globe, and for him who would cruise over pleasant waters between green mountains there is the beautiful Hudson; while "old ocean's gray and melancholy waste" lies outside, inviting the bolder yachtsman to wander far from land. No such field exists anywhere else as that granted the sailer of the Eastern coast, and he is availing himself of his advantages to the utmost.

The yachts of the Eastern clubs may be classified in five general groups: Those which make their home ports between Cape Cod and the coast of Maine are enrolled in thirty-two clubs; those of the Sound and the south shore of Long Island comprise thirty organizations; those of New York harbor and northern New Jersey waters are entered in twenty-one different clubs; the Hudson River has eleven well-established yachting homes; and Delaware Bay has four. To these should be added private

BODY-PLAN OF A SKIPJACK.

not a good cruiser. Its popularity in the waters of New York harbor and the Sound is often a cause of perplexity to old yachters, who have learned by much experience that it is not by any means the best boat that can be used for pleasuring. But its simplicity of design and rig, and its handsome appearance, seem to insure it perpetual good will and a long life among the favorite boats of the time.

Cat-rigged boats with heavy keels are undoubtedly safe and serviceable cruisers, since they are not easily overturned and can face rough weather. They are popular in the waters about Boston harbor and Newport, but

synonymous terms with a great many yachters, and no one can deny that these boats, like Brother Jasper's sun, "do move."

While describing the sandbaggers it may be well to call attention to a type of yacht hull which has been in use for many years, and which is in every practical respect identical with the ordinary light-draft hull. The difference between this type of hull and others is wholly one of cost and appearance. From a sailing point of view this boat, called a "skipjack," or "smoothing-iron," is merely a hard-bilged light-draft boat; that is to say, its peculiar shape has no perceptible effect upon its use as

TYPES OF AMERICAN SLOOP-YAWLS.

are not favored by yachters of New York and vicinity; in the shoal waters of the South they are never seen, for the patent reason that light draft only will serve for use in Southern yachting grounds.

From the center-board catboat grew the jib-and-mainsail sloop, a type of yacht which has always been noted for its great speed and general unhandiness. Small yachts of this kind are always racers, and the interest in racing is sufficient to keep them in the lists of popular boats. In design they are like the catboats, the only difference being in their rig. These two boats, the center-board cat and the jib-and-mainsail sloop, are what yachters call "sandbaggers"; that is to say, their ballast consists of bags of sand which are shifted to windward with every tack and thus serve to keep the yachts right side up. A boat ballasted in this manner can carry more sail than rightly belongs on her sticks, but she cannot be very safe or comfortable. Her place is in the regatta. It is not beyond the truth to assert that the sandbaggers constitute probably two fifths of the total of small yachts. They will never cease to be popular, for the reason that speed and sport are

a vessel. The skipjack is always an odd-looking boat, is never handsome in appearance, and cannot be made to appear pleasing to the nautical eye; but its sailing qualities are excellent. Many men who desire a small yacht adopt the skipjack, and from such a boat get much fun with small outlay of money. A strong, well-built, and correctly molded skipjack is just as good a boat from a sailor's point of view as a sharp-bilged, round-finished vessel of the same general shape.

Passing the sandbaggers, the next popular and most universally used yacht is the ballasted sloop. A sloop may be a center-board boat, or a keel boat, or a combination of both. She has only one mast, and carries a topmast. Her sails are many, and, like the cutter, she is permitted to carry clouds of canvas in a race. Technically speaking, a cutter differs from a sloop only in one point, as the terms "sloop" and "cutter" really apply to the rig of the yacht. The cutter has a sail set from her stem to her masthead; the sloop has not. This is the technical point of difference. This sail is called a forestaysail, and its presence marks the cutter rig. The term "cutter," however, is usually applied to the

FROM A PHOTOGRAPH BY WALTER BLACKBURN.

A CUTTER "RAP-FULL" IN A GOOD BREEZE.

long, narrow, deep-keeled vessel, and has in common parlance grown to mean a boat of that type. It is in that sense that it is generally understood. It is worthy of notice that nearly all yachters who cruise about in summer, and especially those who are fond of speedy boats, use either sloops or cutters; and it is remarkable to see how much comfort can be found in boats of these types, even when quite small. A little cutter or sloop not twenty-five feet long will be provided with berths for four men, dinner-table, lockers, cook-stove, and many other general comforts; and a yacht thirty-five feet long will sleep six people without overcrowding, and have one state-room. The deep-keeled boat is of course the more comfortable yacht, because she has head-room enough to enable one to stand erect in her cabin. Any one who has done much yachting knows how uncomfortable a shallow boat becomes during a long cruise.

The average yachting man, if he be of that stuff of which good seamen are made, soon finds his chief delight in being master of his own vessel. He likes to feel that it is his skill, his prowess, his intellect, that rule the ship in which he sails; and finding this complete mastery of the vessel to be impossible aboard a big boat, he longs for one which he can handle alone. This independent and sportsmanlike instinct of the American yachter has culmi-

nated in a liking for certain classes of very small boats,—“single-handers” they are called,—and this liking has given impetus to the building of some little vessels which are really marvels in their way. Simplicity and handiness of rig have been considered in their construction, and this has led in many cases to the adoption of what is known as the yawl style, a rig which for safety and convenience has never been surpassed by any other. The yawl is really a schooner with very small mainsail. For small cruising-yachts it is an excellent rig, and preferable to the cat rig. Cat-yawls are also in use; they are merely yawls without jibs. With such rigs as these, a yachter can go alone upon the water without fear of trouble, and with no need of assistance. Naturally, with men of moderate means who love the water, these small single-handers have become very popular. Some of them are not over sixteen feet long, yet the solitary skipper-crew-and-cook, all in one, of such a boat finds in his yacht comfortable sleeping-quarters, cook-stove, dinner-table, and all necessary “fixings.” The ingenuity displayed in fitting out the cabins of these little boats is quite remarkable.

Of the many nondescript rigs which are applied to small yachts, two are in common use. One of these is the sharpie, a simple leg-o'-mutton rig used with flat-bottomed boats. Large sharpies have been built with fine cabin accommodations, and such boats are particularly adapted to the shoal waters of the South. They are fast sailers, but, owing to their long, narrow bodies and light draft, are not always trustworthy. They are cheaper to build than boats of other designs. Numerous modifications of the sharpie exist, but the genuine sharpie is always flat-bottomed and leg-o'-mutton rigged. The sharpies of the Sound are famous in their way, and some of the sailers of those waters have even gone to the extreme notion of assuming that they are preferable to any other type of vessel for yachting purposes. Such an assumption is of course absurd, for at best a sharpie is an imperfect vessel, owing to its flat bottom. As an old sailor once remarked, when asked his opinion about boat hulls, “A wessel wot 's more out o' water than she 's in ain't no safe wessel for them as likes to keep dry.” But the sharpie has its place among the yachts, despite the old sailor's opinion, and that place is clearly defined by Nature, who has made so many shallow sailing grounds upon which no other type of boat can go. The sharpie, like the gunboats of which President Lincoln once spoke, “can go wherever it is a little damp,” and its ability to do this entitles it to much respect from the American yachter, who must, if he would sail at all, often frequent very shoal water.

Buckeyes are favored only in the South. Originally the buckeye was a log hollowed out and shaped into a boat, and was used by the negroes. To-day, however, buckeyes are built upon carefully drawn plans, and many of them are excellent vessels. They are common on the coast waters south of the Delaware Bay, and are used chiefly for hunting-boats, their cheapness, handiness, and roominess rendering them useful to the sportsman. A true buckeye is a double-ender, but some large ones have been built with an overhang stern, which destroys the ideal and creates a new kind of craft. The buckeye is not considered "pretty" by yachting men, but it is in every respect a serviceable boat, being both speedy and safe. The lee-board, a primitive contrivance designed to check the drift of a sailing vessel, was attached to the earlier buckeyes, but nowadays the regulation center-board is used with these boats. Lee-boards are sometimes used with flat-bottomed freight-vessels such as one sees in the waters of the Great Lakes and the Gulf of California; they are also attached to some sailing canoes, but are not properly a part of the equipment of any boat worthy to be called a yacht. The lee-board is merely a blade of wood dropped at the side of a vessel to give her a hold upon the water.

Similar to the buckeye in appearance is a vessel used in waters a thousand miles distant from those which are the home of the buckeye, and commonly known as a Mackinaw boat. It is the typical vessel of Lake Superior, upper Lake Michigan, and Green Bay. This boat is also a double-ended craft, rigged generally with two leg-o'-mutton sails, sometimes with the addition of a jib. The Mackinaw boat is popular as a fisherman, and the Indian fishers of the Great Lakes use it in catching whitefish, one of the chief industries of those waters. It can outsail the average fancy yacht, and is a very trustworthy sea-boat, two excellent qualities which have led to its adoption by many yachters of the Lakes as a general cruiser and pleasure-boat. The simple Mackinaw boat has no deck, and has a very pronounced sheer and a high bow and stern, but since it became a yachting craft it has been improved by the addition of deck and cabin, and is one of the best yachts for all-round use that one can find.

A few years ago the sailing public was surprised by the appearance upon the waters of a spider-like contrivance which its friends said was a "catamaran." This new claimant for yachting favor was like the raft of the South Sea Islanders only in name; in fact, it was not a catamaran at all, but a new device for racing over the water by means of sails. Wonderful feats were predicted for the future of the catamaran, and it certainly did accomplish some-

thing; but after a long and fair trial (for the yachter, no matter how bigoted he may be, will always try a new boat) it was discarded as a useless, dangerous, and decidedly unsatisfactory kind of craft. The theory of the catamaran's designers was that by setting sails upon two narrow, sharp hulls placed wide apart great speed could be obtained, because of the small resistance offered by the water against such hulls, and because the wide spread of the two boats would render the craft uncapsizable under lateral wind-pressure. Theory failed to fit facts, however, and the catamaran has long since disappeared from the surface of the waters; its moldering form may be seen almost any-

FROM A PHOTOGRAPH BY WALTER BLACKBURN.

A SLOOP CLOSE-HAULED TO WINDWARD.

where upon the shore of a yachting harbor, a shattered monument to the time, labor, and money that were sacrificed in giving it a trial. The faults of the catamaran were many. It did indeed show speed, provided the conditions under which it was used were exactly to its liking; but Nature has a way of making her conditions disagreeable to the sailor and the ship, and the genius who conceived the catamaran seems not to have taken this into his reckoning when he created his boat. The catamaran was always out of order in rough water; often a moderate chop sea was sufficient to shake it in twain; it had a bad habit of losing or break-

A CATAMARAN.

ing its rudders; it was even guilty of letting its center-board be twisted out just when the center-board was handy to have; it would not rise to a sea, neither would it go through it steadily, as does a well-fined cutter; and it did actually capsize in a very disagreeable and unseemly manner, kicking up its heels and plunging nose down, as a cat-boat will sometimes "pitch-pole," thus turning a porpoise-like somersault, and disgracing both itself and its master. So the catamaran, after a just trial by a jury of all the yachters, has disappeared, and is not likely to be seen again.

Another style of craft, now out of date and rarely seen, is the pirogue, or, as it was usually called, "periauger." This vessel is a double-ended, narrow hull, rigged with two pole-masts each carrying a gaff-sail—what might be termed, in brief, a double cat-rigged boat. The pirogue was at one time the Jersey Dutchman's favorite boat, and in the early days, when New York was still remembered as "New Amsterdam" and Jersey City was known as "Powles Hook," a pirogue-ferry was operated by the enterprising Dutch of the two towns on the opposite shores of the Hudson. In those days a "voyage" across the river against adverse winds was considered quite a journey, and the pirogue making the best time became famous. A comparison between the pirogue-ferry of those times and the equipment of such ferries as now ply across the

Hudson is suggestive of the march which progress has made in a few brief decades. The pirogue is rarely seen nowadays, but one meets it occasionally. It is generally used as a hunting and pleasure-sailing craft. Originally it was fitted with a lee-board, but in the modern boat the center-board takes the place of that discarded contrivance.

A new aspirant has recently come into the yachting field, of which much is expected by certain advocates of shoal-boat sailing. This new craft is really an improved "sneak-box," a form of duck-hunting boat in use all over the country. The sneak-box of the West is a rowboat, but duck-hunters on the New Jersey coast and other waters of the Atlantic seaboard inlets have always built their sneak-boxes with a view to carrying sail, and constant improvement has actually developed a boat which is an exceedingly fine sailer, and a weatherly craft. The further improvement mentioned, which has resulted in the creation of a new type of sail-boat, is known by the somewhat non-nautical name of

"watermelon." It is a spoon-shaped, sloop-rigged craft. This unique vessel has been tried

A CUTTER BEFORE THE WIND, UNDER RACING CANVAS.

FROM A PHOTOGRAPH.

THE "WATERMELON" SLOOP.

for two seasons, and reports speak well of its performance. It is an odd-looking boat, but in the hands of a skilful sailor seems to justify the application of the old saw, "Handsome is as handsome does."

Lake yachting has certain peculiarities not common with yachting on the salt water. For example, the water-ballasted boat, which is seldom seen upon the sea, has been in use by lake yachters for years. Some of the vessels sailed on the waters of the Great Lakes carry no other ballast. The water ballast is sometimes held in fixed tanks secured at the bottom of the boat; in other cases it is carried in long, narrow boxes which are stowed below like a cargo. When racing with tank-ballasted yachts, it has sometimes been customary to alter the ballast by pumping out the water, or by adding more, as the needs of the racer might require. This ability to change ballast at will gives one yacht decided advantage over another with fixed ballast; since, when running free before the wind, the water-ballasted boat may be lightened so that she may go more swiftly, while, when she is compelled to beat to windward under lateral pressure, a refilling of her water-tanks at once adds to her stability and sail-carrying power. By salt-water yachters such a practice would not be countenanced, since it would be considered unfair.

The water-ballasted boat certainly has one point in its favor—if capsized it cannot sink; and this desirable quality in a yacht has given

impetus in the East to the building of what is known as the Norton life-boat, a vessel constructed on peculiar principles. Briefly described, the Norton boat is of the following design. Her water-ballast is confined in tanks on each side of her keel-line; these tanks are opened to the sea at points near the keel; in the upper part of each tank, along each side of the boat, is an air-chamber. The theory of the inventor is that, when the vessel is pressed down to leeward, the water in the leeward tanks is forced upward against the air-cushions, and the resistance of the air thus compressed holds the boat up. The water in the windward tanks cannot escape, because the outlets are below the water-line of the boat; this water remains as "dead ballast." Concerning the Norton boat much has been written, but no positive proof has yet been furnished that it is all that is claimed for it. It certainly behaves well, and is a very stiff boat in a hard blow. Such a boat really floats upon its cabin floor, or rather upon the upper limits of its water-tanks.

Leaving the discussion of the odds and ends of yacht styles, we come, by natural progress, to a type which is destined to greater popularity as time goes on, and yachters learn the ways of the sea, and the best methods of dealing with them. Although the schooner is generally deemed a big yacht, it is nevertheless a fact that small schooners are desirable boats to have, and that the number of schooners of small ton-

FROM A PHOTOGRAPH BY J. M. FOOTE

THE SCHOONER "EDITH."

nage is increasing. There is no denying the advantage of the schooner's rig over that of the sloop. A schooner of forty feet is handier, safer, and less expensive to run than a forty-foot sloop. The rig of the schooner is peculiarly adapted to all weathers, and a small crew can handle such a vessel with ease, when to manage a sloop of equal size would require the best efforts of "all hands and the cook." The reason for this is that the schooner's sails can be attended to one at a time, which is not the case with the big-mainsail sloop. Any yachter of experience can relate tales of hard trials with a sloop in rough weather that would not have worried a schooner's crew at all. The waters of the eastern Sound and of Boston Harbor have many of these little schooners, and their owners get from them an amount of comfort that can never be appreciated save by one who has had experience with both schooner and sloop. A typical yacht of this kind is the flagship *Edith* of the New York Yacht Racing Association. Her owner, President Prime, has cruised in her to Florida, and found her as safe and handy at sea as many a large vessel. Such a yacht is cheap to build, cheap to run, and very roomy. For men who seek to yacht for pleasure, comfort, and safety, the schooner and the yawl are beyond question ideal boats. If racing be the desire of the yachting man, however, the cat, jib-and-mainsail, sloop- and cutter-rigged yachts are the boats in which he should invest and sink his cash.

A word concerning the endless "centerboard-and-keel" controversy may not be out of place here. As applied to small cruising yachts, it is not out of the way to state that, unless shoal waters make it imperative that one should have only a light-draft boat, the deep-keel vessel is much the better craft for the yachter to use. In such a boat depth gives accommodation, the absence of the center-board trunk leaves the cabin freed from a great inconvenience, while the stability of such a boat contributes to safety. It is generally agreed that the best small cruiser is a boat of good beam and draft, carrying her ballast on her keel. Such a yacht is uncapizable, a great advantage in a small vessel. The compromise, or keel-and-centerboard type of boat, is also popular. A boat of this kind has good draft, lead or iron keel-ballast, and the center-board is considered a benefit to her in going about and in racing. The very light-draft center-board yacht is not the best cruiser, the only excuse for her use in that capacity being the necessity of light draft in waters which are shallow, as are the waters of many of our small harbors. A general deduction from these points of view may be summarized thus: use a keel boat if you can; a center-board boat if you must.

With racing yachts the case is different. A racer should be built with one idea—to win; and if light draft and a big center-board will win, one should use them. For rough-water racing, however, it has been demonstrated

quite conclusively that the "skimming-dish," as the light-draft boat is called, is not the best yacht. In bad weather the yacht with good body and draft, and ballast well down, has often proved herself the champion. The narrow-beamed cutter with very deep draft has also held her own in such weather against all comers. And just here a note in reference to the diagrams shown in *a* and *b* may be interesting. These drawings show the development of the deep, narrow boat from the shoal type. They are from the scale plans of well-known yachts,

So a reckoning was made for overhang, and this is the general practice to-day. When the New York Yacht Racing Association was organized, this question of racing-length was decided in a manner so satisfactory that no just complaint of unfairness has ever arisen; and the majority of clubs in the country have adopted the association rule, which is simple, sportsmanlike, and free from the complications that always cause trouble in clubs which use tonnage and sail-area rules. The association rule measures a yacht by this formula :

$$\frac{\text{Length over deck} + \text{water-line length}}{2} = \text{sailing measure};$$

that is to say, one half of the overhang of the stern is allowed.

Concerning this association a word should be said, because its organization marks a new era in yachting. It was formed in 1889 by ten clubs, the object being to create a sportsmanlike spirit and a feeling of cordiality among all yachters. Its growth in popularity was rapid, and in a year its membership had doubled. To-day it includes nearly every yacht-club on the waters of New York harbor, New Jersey, and the western Sound. Its annual regattas have made it a success, as a few figures will show. In the regatta of 1889, 120 yachts entered, the largest number ever sailed in any race. In 1890, the entries numbered 180; in 1891, 160 boats entered. The association has been a boon to yachters, bringing them together in friendly intercourse, and fostering a spirit of good-fellowship and kindly rivalry. The association has a cruise every year, and this feature has become almost as popular with its members as the regatta. Sixty yachts participated in the cruise of 1890. In 1891, one hundred little vessels sailed the waters of Long Island Sound,

*a*, Midship section of typical center-board sloop-yacht, forty feet long over all, fourteen feet beam, three feet nine inches deep, exclusive of trunk. *b*, Body-plan of typical English cutter, thirty-eight feet long over all, six feet beam, and six feet draft.

and serve better than words to mark the different types. The plan *b* is an excellent form of keel type, being excessive neither in draft nor in beam; but *a* is too light for a stable boat. A compromise between *a* and *b* would give a good type of boat for general all-round yachting purposes.

Racing with small yachts has for many years been one of the delights of yachters. With the growth of yachting and the development of organizations this sport grew rapidly in popularity, and now racing is always the great feature of a club's yachting season. In the earlier days of yacht racing some droll things occurred. It was soon discovered that a big boat could beat a small one, and the necessity of time-allowance rules became obvious to the yachters. At first it was deemed sufficient to grade the boats according to size; and actual size being an unattainable measure, length was adopted as a standard of size. So the yachts were measured over their decks for the purpose of classification. Then began an era of building to beat the racing rule, and the result was a boat longer on the keel than over deck. Objection was made to this unfairness, and the rule was changed, the measure of length on the keel being adopted as fair. In a short time the yachting world witnessed the birth of a new type of boat with the keel cut away forward and aft. Again the boat was made bigger than her measure indicated. Next came the water-line rule of measurement, which was fair, excepting that it took no account of the overhang sterns of many yachts, which thus gained advantage over square-sterned boats of equal water-line length.

OLD-STYLE PIROGUE WITH LEE-BOARD.

disbanding at Shelter Island after a most delightful outing. The association has been a success from the start, and has given the small-yachters opportunities which they never could have got in any other way, because the lack of uniformity in racing rules made it impossible for the boats of one club to race with those of another. Whether the racing rules of the association are technically perfect is a mooted question, but they certainly satisfy the yachters, and leave no room for those rancorous feelings which always grow out of a race sailed under "the rules with a plus in 'em," to which genial "Captain Joe" of *Puritan* fame once strongly objected, on the ground that they were not seamanlike, and that no two people could ever read them the same way.

A word should be said, before closing, of the homes of the yachters, for it is in these places that they spend much of their time when ashore, receive their friends, give their banquets, and "spin yarns" during the long winter evenings, while their boats are abandoned upon the shores, or in the snug hibernation of some quiet cove, awaiting the springtime revival and the bustle of preparation for the next summer's sailing. Every yacht-club has a home of some sort, if it be merely a small hut with a set of lockers and some chairs; but most clubs erect really useful houses, and take great pride in having them cozy and well furnished. Some of these buildings are expensive, well-designed structures. Such houses as those of the Atlantic and Brooklyn Clubs of Brooklyn; the Pavonia Club at the Atlantic Highlands of New Jersey; the Eastern Club at Marblehead, Massachusetts; the Larchmont and New Haven Clubs of the Sound; and the Minnetonka Club of Minneapolis, are admirably adapted for yachting purposes. These club-houses are, of course, constructed primarily with a view to the needs of the yacht-owners, and contain ample locker accommodations, sail-lofts, and store-rooms for small boats, oars, spars, etc.; but they also contain fine meeting-rooms, ladies' parlors, and quarters for the stewards, who prepare many a good dinner for the hungry sailors and their friends—and who ever saw a yachting man who was not hungry? Some of these club-houses also have sleeping-rooms in which one who desires to slumber on shore may pass the night, although the yachter himself generally prefers a bunk in his boat to any hotel, no matter how fine. Some clubs, in addition to their

regular club-houses, maintain "annexes" at favorite resorts, which they use as general meeting-places during the yachting season. The New York Yacht Club and the Pavonia and Jersey City Clubs of New Jersey have such buildings, and find them very convenient, the location of their homes not being near enough to the sea to meet the requirements of their sailing. These annex club-houses are plain and substantial.

Yachting in small yachts is, then, the real American yachting. The "big boat" has its place in the yachting world, but it is not the typical American yacht. It is the small-yachter who gives to the sport its wide popularity, and makes yachting so universally loved by men who are fond of aquatic pleasuring. The small-yachter is everywhere upon the waters. From the coast of Maine, from the shores of the harbor of the Golden Gate, from the beaches of the Atlantic seaboard, and from the borders of the inland lakes, he can be seen, all summer long, sailing about in his little vessel, and enjoying in all its fullness the excitement and delight of this most noble and health-giving sport. With a pluck and energy that mark the true lover of the sea, and a tact and skill that bespeak the real sailor, he handles his little craft, in fair weather and in foul, in a manner that leaves no room for doubt as to his fitness for the work which he is doing; for, whether he sail alone, or with the help of his friends, or that of a hired man to run his boat, he is always the master of his vessel,—which is seldom the case with the proprietor of the big boat,—and is in reality a "yachtsman" under all circumstances, at all times, and in all weathers. He must be cool-headed and calm in times of peril, affable and courteous on all social occasions, and generous and prompt to respond to all calls upon his courage—in brief, a gentleman; and, with rare exceptions, he comes up to that standard. There is no profit in yachting, and its trophies are, like those of the old Greek arena, always marks of merit and prowess, never the rewards of sharp practice and dishonest trickery. No race-winner among yachters expects his prizes to pay for his outlay, and this feature of its contests has always kept yachting from drawing to itself the kind of men who disgrace many other forms of sport. Yachting is a pastime that appeals only to those traits of character which are found in the manly man.

Frederic W. Pangborn.

## A GRAY JACKET.

By the Author of "Marse Chan," "Meh Lady," "Elsket," etc.

My meeting with him was accidental. I came across him passing through the square. I had seen him once or twice on the street, each time lurching along so drunk that he could scarcely stagger, so that I

was surprised to hear what he said about the war. He was talking to some one who evidently had been in the army himself, but on the other side—a gentleman with the loyal legion button in his coat, and with a beautiful scar, a sabre-cut across his face; was telling of a charge in some battle or skirmish in which, he declared, his company—not himself; for I remember he said he was "No. 4," and was generally told off to hold the horses; and that that day he had had the ill luck to lose his horse and get a little scratch himself, so he was not in the charge—did the finest work he ever saw, and really, so he claimed, saved the day. It was this self-abnegation that first arrested my attention, for I had been accustomed all my life to hear the war talked of; it was one of the inspiring influences in my humdrum existence. But the speakers, although they generally boasted of their commands, not of themselves individually, usually admitted that they themselves had been in the active force, and thus tacitly shared in the credit. "No. 4," however, expressly disclaimed that he was entitled to any of the praise, declaring that he was safe behind the crest of the hill (which he said he "hugged mighty close"), and claimed the glory for the rest of the command.

"It happened just as I have told you here," he said, in closing. "Old Joe saw the point as soon as the battery went to work, and sent Binford Terrell to the colonel to ask him to let him go over there and take it; and when Joe gave the word the boys went. They did n't go at a walk either, I tell you; it was n't any promenade: they went clipping. At first the guns shot over 'em; did n't catch 'em till the third fire; then they played the devil with 'em: but the boys were up there right in 'em before they could do much. They turned the guns on 'em as they went down the hill (oh, our boys could handle the tubes then as well as the artillery themselves), and in a little while the rest of the line came up, and we formed a line of battle right there on that crest, and held it till

nearly night. That 's when I got jabbed. I picked up another horse, and with my foolishness went over there. That evening, you know, you all charged us—we were dismounted then. We lost more men then than we had done all day; there were forty-seven out of seventy-two killed or wounded. They walked all over us; two of 'em got hold of me (you see, I went to get our old flag some of you had got hold of), but I was too worthless to die. There were lots of 'em did go though, I tell you; old Joe in the lead. Yes, sir; the old company won that day, and old Joe led 'em. There ain't but a few of us left; but when you want us, colonel, you can get us. We 'll stand by you."

He paused in deep reflection; his mind evidently was back with his old company and its gallant commander "old Joe," whoever he might be, who was remembered so long after he passed away in the wind and smoke of that unnamed evening battle. I took a good look at him, at "No. 4," as he called himself. He was tall, but stooped a little; his features were good, at least his nose and brow were; his mouth and chin were weak. His mouth was too stained with the tobacco which he chewed to tell much about it,—and his chin was like so many American chins, not strong. His eyes looked weak. His clothes were very much worn, but they had once been good; they formerly had been black, and well made; the buttons were all on. His shirt was clean. I took note of this, for he had a dissipated look, and a rumpled shirt would have been natural. A man's linen tells on him before his other clothes do. His listener had evidently been impressed by him also, for he rose and said abruptly, "Let's go and take a drink." To my surprise "No. 4" declined. "No, I thank you," he said, with promptness. I instinctively looked at him again to see if I had not misjudged him; but I concluded not, that I was right, and that he was simply "not drinking." I was flattered at my discrimination when I heard him say that he had "sworn off." His friend said no more, but remained standing while "No. 4" expatiated on the difference between a man who is drinking and one who is not. I never heard a more striking exposition of it. He said he wondered that any man could be such a fool as to drink liquor; that he had determined never to touch another drop. He presently relapsed into silence, and the other reached out his hand

to say good-by. Suddenly rising, he said: "Well, suppose we go and have just one for old times' sake. Just one now, mind you; for I have not touched a drop in—" He turned away, and I did not catch the length of the time mentioned; but I have reason to believe that "No. 4" overstated it.

The next time I saw him was in the police court. I happened to be there when he walked out of the pen among as miscellaneous a lot of chronic drunkards, thieves, and miscreants of both sexes and several colors as were ever gathered together. He still had on his old black suit, buttoned up; but his linen was rumpled and soiled like himself, and he was manifestly just getting over a debauch, the effects of which were still visible on him in every line of his perspiring face and thin figure. He walked with that exaggerated erectness which told his self-deluded state as plainly as if he had pronounced it in words. He had evidently been there before, and more than once. The justice nodded to him familiarly:

"Here again?" he asked in a tone part pleasantry, part regret.

"Yes, your honor. Met an old soldier last night, and took a drop for good fellowship, and before I knew it—" A shrug of the shoulders completed the sentence, and the shoulders did not straighten any more.

The tall officer who had picked him up said something to the justice in a tone too low for me to catch; but "No. 4" heard it,—it was evidently a statement against him,—for he started to speak in a deprecating way. The judge interrupted him:

"I thought you told me last time that if I let you go you would not take another drink for a year."

"I forgot," said "No. 4" in a low voice.

"This officer says you resisted him."

The officer looked stolidly at the prisoner as if it were a matter of not the slightest interest to him personally. "Cursed me and abused me," he said, dropping the words slowly as if he were checking off a schedule.

"I did not, your honor; indeed, I did not," said "No. 4" quickly. "I swear I did not; he is mistaken. Your honor does not believe I would tell you a lie! Surely I have not got so low as that."

The justice turned his pencil in his hand doubtfully, and looked away. "No. 4" took in his position. He began again.

"I fell in with an old soldier, and we got to talking about the war—about old times." His voice was very soft. "I will promise your honor that I won't take another drink for a year. Here, I'll take an oath to it. Swear me." He seized the greasy little Bible on the desk before him, and handed it to the justice. The magis-

trate took it doubtfully. He looked down at the prisoner half kindly, half humorously.

"You'll just break it." He started to lay the book down.

"No; I want to take the pledge," said "No. 4," eagerly. "Did I ever break a pledge I made to your honor?"

"Did n't you promise me not to come back here?"

"I have not been here for nine months. Besides, I did not come of my own free will," said "No. 4," with a faint flicker of humor on his perspiring face.

"You promised not to take another drink."

"I forgot that. I did not mean to break it; indeed, I did not. I fell in with—"

The justice looked away, considered a moment, and ordered him back into the pen with, "Thirty days under the hill, to cool off."

"No. 4" stood quite still till the officer motioned him to the gate, behind which the prisoners sat in stolid rows. Then he walked dejectedly back into the pen, and sat down by a drunken negro. His look touched me, and I went around and talked to the magistrate privately. But he was inexorable; he said he knew more of him than I did, and that thirty days in jail would "dry him out and be good for him." I told him the story of the battle. He knew it already, and said he knew more than that about him: that he had been one of the bravest soldiers in the whole army; did not know what fear was; had once ridden into the enemy and torn a captured standard from its captors' hands, receiving two desperate bayonet-wounds in doing it; and had done other acts of conspicuous gallantry on many occasions. I pleaded this, but he was obdurate; hard, I thought at the time, and told him so; told him he had been a soldier himself, and ought to be easier. He looked troubled, not offended; for we were friends, and I think he liked to see me, who had been a boy during the war, take up for an old soldier on that ground. But he stood firm. I must do him the justice to say that I now think it would not have made any difference if he had done otherwise.

"No. 4" must have heard me trying to help him, for one day about a month after that he walked in on me quite sober, and looking somewhat as he did the first day I ever saw him; thanked me for what I had done for him; delivered one of the most impressive discourses on intemperance that I ever heard; and asked me to try to help him get work. He was willing to do anything, he said; that is, anything he could do. I got him a place with a friend of mine which he kept a week, then got drunk. We got hold of him, however, and sobered him up, and he escaped the police and the justice's

court. Being out of work, and very firm in his resolution never to drink again, we lent him some money—a very little—with which to keep along a few days, on which he got drunk immediately, and did fall into the hands of the police, and was sent to jail as before. This, in fact, was his regular round: into jail, out of jail; a little spell of sobriety, “an accidental fall,” which occurred as soon as he could get a drop of liquor, and into jail again for thirty or sixty days according to the degree of resistance he gave the police,—who always, by their own account, simply invited him politely to go home, and, by his, insulted him,—and to the violence of the language he applied to them. In this he excelled; for although as quiet as possible when he was sober, when he was drunk he was a terror, so the police said, and his resources of vituperation were cyclopedic. He possessed in this particular department an eloquence which was incredible. His blasphemy was vast, illimitable, infinite. He told me once that he could not explain it; that when he was sober he abhorred profanity, and never uttered an oath; when he was in liquor his brain took this turn, and distilled blasphemy in volumes. He said that all of its energies were quickened and concentrated in this direction, and then he took not only pleasure, but pride in it. He felt inspired like one of the old prophets denouncing the sins of Israel.

He told me a good deal of his life. He had got very low at this time, much lower than he had been when I first knew him. He recognized this himself, and used to analyze and discuss himself in quite an impersonal way. This was when he had come out of jail, and after having the liquor “dried out” of him. In such a state he always referred to his condition in the past as being something that never would or could recur; while on the other hand, if he were just over a drunk, he frankly admitted his absolute slavery to his habit. When he was getting drunk he shamelessly maintained, and was ready to swear on all the Bibles in creation, that he had not touched a drop, and never expected to do so again,—indeed, could not be induced to do it,—when in fact he would at the very time be reeking with the fumes of liquor, and perhaps had his pocket then bulging with a bottle which he had just emptied, and would willingly have bartered his soul to refill.

I never saw such absolute dominion as the love of liquor had over him. He was like a man in chains. He confessed it frankly and calmly. He said he had a disease, and gave me a history of it. It came on him, he said, in spells; that when he was over one he abhorred it, but when the fit seized him it came suddenly, and he was in absolute slavery to it. He said his father was a gentleman of convi-

vial habits (I have heard that he was very dissipated, though not openly so, and “No. 4” never admitted it). He was killed at the battle of Bull Run. His mother—he always spoke of her with unvarying tenderness and reverence—had suffered enough, he said, to canonize her if she were not a saint already; she had brought him up to have a great horror of liquor, and he had never touched it till he went into the army. In the army he was in a convivial crowd, and they had hard marching and poor rations, often none, and drinking got to be held the proper thing. Liquor was scarce, and was regarded as a luxury; so although he was very much afraid of it, yet for good fellowship’s sake, and because it was considered manly, he used to drink it. Then he got to like it; and then got to feel the need of it, and took it to stimulate him when he was run down. This want brought with it a great depression when he did not have the means to satisfy it. He never liked the actual taste of it; he said few drunkards did. It was the effect that he was always after. This increased on him, he said, until finally it was no longer a desire, but a passion, a necessity; he was obliged to have it. He felt then that he would commit murder for it. “Why, I dream about it,” he said. “I will tell you what I have done. I have made the most solemn vows, and have gone to bed and gone to sleep, and waked up and dressed and walked miles through the rain and snow to get it. I believe I would have done it if I had known I was going next moment to hell.” He said it had ruined him; said so quite calmly; did not appear to have any special remorse about it; at least, never professed any; said it used to trouble him, but he had got over it now. He had had a plantation,—that is, his mother had had,—and he had been quite successful for a while; but he said, “A man can’t drink liquor and run a farm,” and the farm had gone.

I asked him how?

“I sold it,” he said calmly; “that is, persuaded my mother to sell it. The stock that belonged to me had nearly all gone before. A man who is drinking will sell anything,” he said. “I have sold everything in the world I had, or could lay my hands on. I have never got quite so low as to sell my old gray jacket that I used to wear when I rode behind old Joe. I mean to be buried in that—if I can keep it.” He had been engaged to a nice girl; the wedding-day had been fixed; but she had broken off the engagement. She married another man. “She was a mighty nice girl,” he said quietly. “Her people did not like my drinking so much. I passed her not long ago on the street. She did not know me.” He glanced down at himself quietly. “She looks older than she did.” He said that he had had a place for some time,

did not drink a drop for nearly a year, and then got with some of the old fellows, and they persuaded him to take a little. "I cannot touch it. I have either got to drink or let it alone—one thing or the other," he said. "But I am all right now," he declared triumphantly, a little of the old fire lighting up in his face. "I never expect to touch a drop again."

He spoke so firmly that I was persuaded to make him a little loan, taking his due-bill for it, which he always insisted on giving. I have a pile of these valuable securities now filed away with a somewhat smaller number of pledges of various degrees of asseveration which he made from time to time. I had not then come to know him so well as I did afterward. That evening I saw him being dragged along by three policemen, and he was cursing like a demon. The maledictions of Ezekiel and Jeremiah mingled with the language of Billingsgate were being poured forth in the street in a resistless torrent.

In the course of time he got so low that he spent much more than half his time in jail. He became a perfect vagabond, and with his clothes ragged and dirty might be seen reeling about, or standing around the street corners near disreputable bars, waiting for a chance drink, or sitting asleep in doorways of untenanted buildings. His companions would be one or two chronic drunkards like himself, with red noses, bloated faces, dry hair, and filthy clothes. Sometimes I would see him hurrying along with one of these as if they had a piece of the most important business in the world. An idea had struck their addled brains that by some means they could manage to secure a drink. Yet in some way he still held himself above these creatures, and once or twice I heard of him being under arrest for resenting what he deemed an impertinence from them.

Once he came very near being drowned. There was a flood in the river, and a large crowd was watching it from the bridge. Suddenly a little girl's dog fell in. It was pushed in by a ruffian. The child cried out, and there was a commotion. When it subsided a man was seen swimming for life after the little white head going down the stream. It was "No. 4." He had slapped the fellow in the face, and then had sprung in after the dog. He caught it, and got out himself, though in too exhausted a state to stand up. When he was praised for it, he said, "A member of old Joe's company who would not have done that could not have ridden behind old Joe." I had this story from eye-witnesses, and it was used shortly after with good effect; for he was arrested for burglary, breaking into a man's house one night. It looked at first like a serious case, for some money had been taken out of a drawer; but when the case

was investigated it transpired that the house was a bar-room over which the man lived,—he was the same man who had pitched the dog into the water,—and that "No. 4," after being given whisky enough to make him a madman, had been put out of the place, had broken into the bar during the night to get more, and was found fast asleep in a chair with an empty bottle beside him. I became satisfied that if any money had been taken the barkeeper, to make out a case against "No. 4," had taken it himself, and the jury thought so too. But there was a technical breaking, and it had to be got around; so his counsel appealed to the jury, telling them what he knew of "No. 4," together with the story of the child's dog, and "No. 4's" reply. There were one or two old soldiers on the jury, and they acquitted him, on which he somehow managed to get whisky enough to land him back in jail in twenty-four hours.

IN May, 1890, there was a monument unveiled in Richmond. It was a great occasion, and not only all Virginia, but the whole South, participated in it with great fervor, much enthusiasm, and many tears. It was an occasion for sacred memories. The newspapers talked about it for a good while beforehand; preparations were made for it as for the celebration of a great and general ceremony in which the whole South was interested. It was interested, because it was not only the unveiling of a monument for the old commander, the greatest and loftiest Southerner, and, as the South holds, man, of his time; it was an occasion consecrated to the whole South, now strongly and henceforth forever for the Union as it is; it was the embalming in precious memories, and laying away in the tomb of the Southern Confederacy, the apotheosis of the Southern people. As such all were interested in it, and all were prepared for it. It was known that all that remained of the Southern armies would be there: of the armies that fought at Shiloh, and Bull Run, and Fort Republic; at Seven Pines, Gaines's Mill, and Cold Harbor; at Antietam, Fredericksburg, Chancellorsville, and Gettysburg, Atlanta, Murfreesboro, and Chickamauga, Spotsylvania, the Wilderness, and Petersburg; and the whole South, Union as it is now to the core and ready to fight the nation's battles, gathered to glorify Lee, the old commander, and to see the survivors of those and other bloody fields in which the volunteer soldiers of the South had held the world at bay, and added to the glorious history of their race. Men came all the way from Oregon and California to be present. Old one-legged soldiers stumped it from West Virginia. Even "No. 4," though in the gutter, caught the contagion, and shaped up and became sober. He got a good

suit of clothes somewhere,—not new,—and appeared quite respectable. He even got something to do, and was put on one of the many committees having a hand in the entertainment arrangements. I never saw a greater change in any one. It looked as if there was hope for him yet. He stopped me on the street a day or two before the unveiling and told me he had a piece of good news: the remnant of his old company was to be here; he had got hold of the last one,—there were nine of them left,—and he had his old jacket that he had worn in the war, and he was going to wear it on the march. "It's worn, of course," he said, "but my mother put some patches over the holes, and except for the stain on it it's in good order. I believe I am the only one of the boys that has his jacket still; I have never got so hard up as to part with it. I'm all right now. I mean to be buried in it."

I had never remarked before what a refined face he had; his enthusiasm made him look younger than I had ever seen him. I saw him on the day before the eve of the unveiling; he was as busy as a bee, and looked almost handsome. "The boys are coming in by every train," he said. "Look here"; he pulled me aside, and unbuttoned his vest. A piece of faded gray cloth was disclosed. He had the old gray jacket on under his other coat. "I know the boys will like to see it," he said. "I'm going down to the train now to meet one—Binford Terrell. I don't know whether I shall know him. Binford and I used to be much of a size. We did not use to speak at one time; had a falling out about which one should hold the horses; I made him do it, but I reckon he won't remember it now. I don't. I have not touched a drop. Good-by." He went off.

The next night about bedtime I got a message that a man wanted to see me at the jail immediately. It was urgent. Would I come down there at once? I had a foreboding, and I went down. It was as I suspected. "No. 4" was there behind the bars. "Drunk again," said the turnkey, laconically, as he let me in. He let me see him. He wanted me to see the judge and get him out. He besought me. He wept. "It was all an accident"; he had "found some of the old boys, and they had got to talking over old times, and just for old times' sake," etc. He was too drunk to stand up; but the terror of being locked up next day had sobered him, and his mind was perfectly clear. He implored me to see the judge and to get him to let him out. "Tell him I will come back here and stay a year if he will let me out to-morrow," he said brokenly. He showed me the gray jacket under his vest, and was speechless. Even then he did not ask release on the ground that he was a veteran. I never knew him to urge

this reason. Even the officials who must have seen him there fifty times were sympathetic; and they told me to see the justice, and they believed he would let him out for next day. I applied to him as they suggested. He said, "Come down to court to-morrow morning." I did so. "No. 4" was present, pale and trembling. As he stood there he made a better defense than any one else could have made for him. He admitted his guilt, and said he had nothing to say in extenuation except that it was the "old story," he "had not intended it"; he deserved it all, but would like to get off that day; had a special reason for it, and would, if necessary, go back to jail that evening and stay there a year, or all his life. As he stood awaiting sentence, he looked like a damned soul. His coat was unbuttoned, and his old, faded gray jacket showed under it. The justice, to his honor, let him off. "No. 4" shook hands with him, unable to speak, and turned away. Then he had a strange turn. We had hard work to get him to go into the procession. He positively refused; said he was not fit to go or to live, began to cry, and took off his jacket. He would go back to jail, he said. We finally got him straight, accepted from him a solemn promise not to touch a drop till the celebration was over, so help him God, and sent him off to join his old command at the tobacco warehouse on the slip where the cavalry rendezvoused. I had some apprehension that he would not turn up in the procession; but I was mistaken. He was there with the old cavalry veterans, as sober as a judge, and looking every inch a soldier.

It was a strange scene, and an impressive one even to those whose hearts were not in sympathy with it in any respect. Many who had been the hardest fighters against the South were in sympathy with much of it, if not with all. But to those who were of the South, even with hearts then fixed upon the Union, it was sublime. It passed beyond mere enthusiasm, however exalted, and rested in the profoundest and most sacred depths of their being. There were many cheers, but more tears; not tears of regret or mortification (for the flag of the Union that we now love floated everywhere, placed by hands that once fought against it), but tears of sympathy and hallowed memory. The gaily decorated streets, in all the bravery of fluttering ensigns and bunting; the martial music of many bands; the constant tramp of marching troops; the thronged sidewalks, verandas, and roofs; the gleam of polished arms and glittering uniforms; the flutter of gay garments, and the smiles of beautiful women sweet with sympathy; the long line of old soldiers, faded and broken and gray, yet each self-sustained, and inspired by the life of the South that flowed in

their veins, marching under the old Confederate flags that they had borne so often in victory and in defeat—all contributed to make the outward pageant a scene never to be forgotten. But this was merely the outward image; the real fact was the spirit. It was the South. It was the spirit of the South, Confederate and Union; not of the new South, nor yet merely of the old South, but the spirit of the great South. When the young troops from every Southern State marched by in their fresh uniforms, with well-drilled battalions, there were huzzas, much applause and enthusiasm; when the old soldiers came there was a tempest, wild cheers choking with sobs and tears, the well-known, once-heard-never-forgotten cry of the South, known in history as "the rebel yell." Men and women and children joined in it. It began at the first sight of the regular column, swelled up the crowded streets, rose to the thronged housetops, ran along them for squares, and then came rolling back in volume only to rise and swell again greater than before. Men wept; women sobbed aloud. What was it? Only a thousand or two of old or aging men riding or tramping along through the dust of the street, under some old flags, dirty and ragged and stained. But they represented the spirit of the South; they represented the spirit which when honor was in question never counted the cost; the spirit that had stood up for the South against overwhelming odds for four years, and until the South had crumbled and perished under the forces of war; the spirit that is the strongest guaranty to us to-day that the Union is and is to be; the spirit that, glorious in victory, had displayed a fortitude yet greater in defeat. Devoted to the Union, filled with enthusiasm for her, they saw in every stain on those tattered standards the blood of their noblest, bravest, and best; in every rent a proof of their glorious courage and sacrifice. They saw in those gray and careworn faces, in those old clothes interspersed now and then with a faded gray uniform, the men who in the ardor of their youth had, for the South, faced death undaunted on a hundred fields, and had never even thought it great; men who had looked immortality in the eyes, yet had been thrown down and trampled underfoot, and who were greater in their overthrow than when glory poured her light upon their upturned faces. Not one of them all but was self-sustaining, sustained by the South, or had ever even for one moment thought in his direst extremity that he would have what was undone.

The crowd was immense; the people on the fashionable street up which the procession passed were fortunate; they had the advantage of their yards and porticos, and they threw them open to the public. Still the throng on the side-

walks was tremendous, and just before the old veterans came along the crush increased. As it resettled itself I became conscious that a little old woman in a rusty black dress whom I had seen patiently standing alone in the front line on the street corner for an hour had lost her position, and had been pushed back against the railing, and had an anxious, disappointed look on her face. She had a little faded knot of Confederate colors fastened in her old dress, and, almost hidden by the crowd, she was looking up and down in some distress to see if she could not again get a place from which she could see. Finally she seemed to give it up, and stood quite still, tiptoeing now and then to try to catch a glimpse. I was about to go to help her when, from a gay and crowded portico above her, a young and beautiful girl in a white dress, whom I had been observing for some time as the life of a gay party, as she sat in her loveliness, a queen on her throne with her courtiers around her, suddenly rose and ran down into the street. There was a short colloquy. The young beauty was offering something which the old lady was declining; but it ended in the young girl leading the older woman gently up on to her veranda and giving her the chair of state. She was hardly seated when the old soldiers began to pass.

As the last mounted veterans came by, I remembered that I had not seen "No. 4"; but as I looked up, he was just coming along. In his hand, with staff resting on his toe, he carried an old standard so torn and tattered and stained that it was scarce recognizable as a flag. I did not for a moment take in that it was he, for he was not in the gray jacket that I had expected to see. He was busy looking down at the throng on the sidewalk, evidently searching for some one whom he expected to find there. He was in some perplexity, and pulled in his horse, which began to prance. Suddenly the applause from the portico above arrested his attention, and he looked toward it and bowed. As he did so his eye caught that of the old lady seated there. His face lighted up, and, wheeling his prancing horse half around, he dipped the tattered standard, and gave the royal salute as though saluting a queen. The old lady pressed her wrinkled hand over the knot of faded ribbon on her breast, and made a gesture to him, and he rode on. He had suddenly grown handsome. I looked at her again; her eyes were closed, her hands were clasped, and her lips were moving. I saw the likeness; she was his mother. As he passed me I caught his eye. He saw my perplexity about the jacket, glanced up at the torn colors, and pointed to a figure just beyond him dressed in a short faded jacket. "No. 4" had been selected, as the highest honor, to carry the old colors which he had

once saved; and not to bear off all the honors from his friend, he had with true comradeship made Binford Terrell wear his cherished jacket. He made a brave figure as he rode away, and my cheer died on my lips as I thought of the sad old mother in her faded knot, and of the dashing young soldier who had saved the colors in that unnamed fight.

After that we got him a place, and he did well for several months. He seemed to be cured. New life and strength appeared to come back to him. But his mother died, and one night shortly afterward he disappeared, and remained lost for several days. When we found him he had been brought to jail, and I was sent for to see about him. He was worse than I had ever known him. He was half-naked and little better than a madman. I went to a doctor about him, an old army surgeon, who saw him, and shook his head. "*Mania a potu*. Very bad; only a question of time," he said. This was true. "No. 4" was beyond hope. Body and brain were both gone. It got to be only a question of days, if not of hours. Some of his other friends and I determined that he should not die in jail; so we took him out and carried him to a cool, pleasant room looking out on an old garden with trees in it. There in the dreadful terror of raving delirium he passed that night. I with several others sat up with him. I could not have stood many more like it. All night long he raved and tore. His oaths were blood-curdling. He covered every past section of his life. His army life was mainly in his mind. He fought the whole war over. Sometimes he prayed fervently; prayed against his infirmity; prayed that his chains might be broken. Then he would grow calm for a while. One thing recurred constantly: he had sold his honor, betrayed his cause. This was the order again and again, and each time the paroxysm of frightful fury came on, and it took all of us to hold him. He was covered with snakes: they were chains on his

wrists and around his body. He tried to pull them from around him. At last, toward morning, came one of these fearful spells worse than any that had gone before. It passed, and he suddenly seemed to collapse. He sank, and the stimulant administered failed to revive him.

"He is going," said the doctor, quietly, across the bed. Whether his dull ear caught the word or not, I cannot say; but he suddenly roused up, tossed one arm, and said:

"Binford, take the horses. I'm going to old Joe," and sank back.

"He's gone," said the doctor, opening his shirt and placing his ear over his heart. As he rose up I saw two curious scars on "No. 4's" emaciated breast. They looked almost like small crosses, about the size of the decorations the European veterans wear. The old doctor bent over and examined them.

"Hello! Bayonet-wounds," he said briefly.

A little later I went out to get a breath of fresh morning air to quiet my nerves, which were somewhat unstrung. As I passed by a little second-hand clothing-store of the meanest kind, in a poor, back street, I saw hanging up outside an old gray jacket. I stopped to examine it. It was stained behind with mud, and in front with a darker color. An old patch hid a part of the front; but a close examination showed two holes over the breast. It was "No. 4's" lost jacket. I asked the shopman about it. He had bought it, he said, of a pawnbroker who had got it from some drunkard, who had probably stolen it last year from some old soldier. He readily sold it, and I took it back with me; and the others being gone, an old woman and I cut the patch off it and put "No. 4's" stiffening arms into the sleeves. Word was sent to us during the day to say that the city would bury him in the poor-house grounds. But we told them that arrangements had been made; that he would have a soldier's burial. And he had it.

## IT SO CHANCED.

I.

IT so chanced  
On that leaden-hearted day,  
Rugged winter leagues away,  
As he thought of her there came  
On the waste a sunny flame  
Wherewithin the frost-mote danced,  
While an echo rang her name.  
It so chanced.

II.

It so chanced  
On that evening bleak and hard,  
Martial-couched on frozen sward,  
As he thought of her there crept  
Music down the blast, that kept  
All his senses dream-entranced,  
While, from ambush watched, he slept.  
It so chanced.

III.

It so chanced  
In that twilight winged with ill,  
When his piercé heart stood still,  
As he dreamed of her, he passed!  
Then, from out the circling Vast,  
With a smile his love advanced—  
“I, to meet thee, have sped fast!”  
It so chanced.

*Edith M. Thomas.*

## LOVE'S HORIZON.

THE sky is like a woman's love,  
The ocean like a man's;  
Oh, neither knows, below, above,  
The measure that it spans!

The ocean tumbles wild and free,  
And rages round the world;  
On reef and wreck eternally  
Its ruthless waves are hurled.

The sky has many a gloomy cloud  
And many a rainy dash;  
Sometimes the storms are long and loud,  
With wind and lightning-flash.

But ever somewhere, fair and sweet,  
Low stoops the adoring blue,  
Where ocean heavenward leaps to greet  
The sky so soft and true.

They meet and blend all round the rim;  
Oh, who can half divine  
What cups of fervid rapture brim  
On the horizon line?

The sky is like a woman's love,  
The ocean like a man's;  
And neither dreams, below, above,  
The measure that it spans.

*Maurice Thompson.*

## CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

XIV.

OME time passed before we met to hear my account of the character doctor, and meanwhile St. Clair had abruptly left town the day after our hospital experience.

Mrs. Vincent was talking to her husband when, just after dinner, I entered her drawing-room.

"It is an age since we met," she cried cordially. "Sit down. Mr. Clayborne will be here shortly. And what have you done to my poor St. Clair? Read that," and she took from her work-basket a note dated the night I last saw him.

I cannot dine with you to-morrow. I have seen to-night what I shall be some day. It is horrible.

It was true, and he had gone away into the woods for a fortnight, like a wounded animal. Nor did he ever speak of it again, but came back as gay and joyous as usual. I returned the note to her.

"How could you?" she said. "I should have known how he would feel."

"I took him," I returned, "because he was reasonable in his desire to see a man die. But I suppose that, with all its awe, death is so constantly about us doctors that we cannot estimate its influence upon others. When I left him—for he *would* stay—he was simply curious and contemplative."

"Do you remember," said Mrs. Vincent, "that description in Stendhal of the Italian who first sees death of a sudden on a great battlefield—his surprise, his curiosity, and at last his terror? It is in his 'La Chartreuse de Parme.'"

"No; I will look at it, but I have seen all this in war once or twice."

As she spoke, Clayborne came in. "Of what are you speaking?" he said.

"Of fear. Of the anguish of fear, uncontrollable, like the fear in dreams."

"Yes; the agony of terror," I returned. "One sees it in the insane at times, and in delirium tremens. There is nothing in normal life to compare with it."

"And were you ever afraid in war?"

"Abominably. We were supposed as surgeons to be non-combatants, but that means merely that one is to run risks without the chance to quiet himself by violent action. Practically, we lost in dead and hurt a long list of surgeons."

"Indeed? I did not know that. And what do you think the best test, after all, of a man's courage?" said Vincent.

"To face a mob or a madman. I knew a man who once by ill luck was shut up with a crazy, athletic brute. My friend locked the door, hearing the man's wife wailing outside. The brute, while suffering from a delusion, had once hurt her; and now again imagining her to have been false to him, meant to kill her. He asked for the key, and gave my friend five minutes to reflect, as he stood before him with a billet of wood he had seized from the hearth."

"And what did your friend do?"

"It was summer, and the windows were open. He threw the key into the street."

"And what then?"

"Oh, help came just as it was wanted, which is rare in this world. I have cut a long story short. My friend said afterward that he was glad of the experience; that he had little hope of escape, and now felt sure for the first time in his life that he was equal to any test of courage."

"I can understand that," said Vincent. "In these quiet days we are rarely tried as to courage. But, after all, is n't it somewhat a matter of training—of profession? I suppose, North, it never enters into your mind to fear contagious disease?"

"Never; except as to one disease: I have a fancy I shall die of yellow fever."

"Oh, but," said our hostess, "is n't it also true that physicians do not take disease as others do?"

"No; that is a popular notion, but quite untrue. I have thrice suffered from disease thus acquired: once from smallpox, twice from diphtheria. In Ireland, in the great typhus years, physicians died in frightful numbers, and so did the old doctors here in yellow-fever days. Unlike the soldier, we are always under fire."

"I should certainly run from smallpox. I might face a madman," said Mrs. Vincent. "As to war, I should run."

"And I from a dog," said Clayborne. "And you, Vincent?"

"I do not know," he returned. "I cannot imagine anything which would make me visibly show fear. I think I am more afraid of what Anne would think of me than of any earthly object of dread. I can conceive as possible what North mentioned. We must have somewhere a nerve-organ or -organs which feel what we call fear. Now, to have these so diseased as to originate a sensation of causeless, overwhelming terror, uncontrollable by will, must be of possible human torture the worst. And you have seen it?"

"Yes. A man says, 'I am afraid.' You say, 'Of what?' He cannot tell you. 'Of nothing. I am afraid.'"

"Two things I fear," cried St. Clair, who had come in silently behind us—"pain and a ghost."

"So glad to see you," cried Mrs. Vincent. "Sit down. We are discussing fear, cowardice, courage."

"Pain I fear most," he said, "yet hardly know it. And a ghost! Well, I know that. I have seen one."

"What? When? Where?" they cried.

"Ask North," he replied.

"Yes, it is true; but first, before I come in with skeptical comments, let us hear your story. You are the only one here who has seen a ghost."

"I was in my studio six months ago at dusk. I was thinking, as I stood, of how well my statue of Saul looked, the light being dim, as it would have been in his tent. I remembered then having seen the statues of the Louvre on a moonlight night, when, with the curator, I lingered along the hall of the great Venus. Some of the fine lines of Sill's poem came back to me, and, turning, I moved toward the front room to get the book. At that moment I became aware of a black figure on my left side. It was literally shrouded from head to foot; even the face and the extremities were hidden. At first I was surprised, and then by degrees a deadly fear possessed me. I was motionless, and it did not stir. I turned to face it, but, as I did so, it moved so as to keep relatively to me the same position. The whole act, if I may call it that, lasted, I should say, a minute. Then an agitation seized the form, as if it were convulsed under its black cloak, and a faint glow, like phosphorescence, ran along the lines of the drapery, and it was gone."

When he finished there was a moment of silence. Then Mrs. Vincent exclaimed, "Was that all?"

"A ghost in daytime," said Clayborne. "And the comment, North."

"As he lost it," said I, "he felt a violent pain

over his left eye, and this was one of his usual attacks of neuralgic headaches. He has seen this phantom twice since. It was merely the substitution of a figure of a cloaked man for the lines of zigzag light which usually precede his headaches, and are not very rare. One man sees stars falling, one a catharine-wheel; but the appearance of distinct human or other forms in their place is a recent observation. I have known a woman to see her dead sister, until, after many returns of the phantom, she ceased to be impressed by it."

"How disappointing!" exclaimed Mrs. Vincent.

"And do you think these facts," said Vincent, "explain some ghost-tales?"

"Yes, some. I have seen cases where the headache did not follow the catharine-wheel, or the lines of light, or the specter, or was very trifling. And in some of these the ghost was duly honored as a true article until subsequent and violent neuralgias explained it as a rare symptom of a common disorder."

"Is the disease itself understood?" said Clayborne.

"No disease is understood. We trace back the threads a little way, and find a tangle none can unravel."

"Then the disease is as bad as a ghost—a real ghost," cried Mrs. Vincent.

"I disbelieve in ghosts, and do not try at spiritual explanations. The material for study of nature is with us always. We cannot experiment on ghosts. I know of at least but one hint in that direction."

"And that?" said Clayborne.

"Well, if the ghost be a real thing outside of us, you will on theory double it if with a finger you press one eye out of line, thus, and will then be able to say, like the mousquetaire in the 'Ingoldsby Legends,' *'Mon Dieu! V'la deux.'*"

"Which shows," said Mrs. Vincent, gaily, "how easily one may become the cause of duplicity in others. It is a lesson in morals."

"Imagine *Hamlet* squinting at his papa!" said St. Clair. "I tried it on my ghost, but it failed. North says he was only a monocularly projected phantom."

"That sounds reasonably explanatory," growled Clayborne, grimly.

"But what does your phrase really mean?" asked Mrs. Vincent of me.

"It means that the phantom is present only to one eye in these cases. To be able to double it, it must be seen by both eyes and be really external. If it be only in the brain, and due to brain disorder, we should not be able to squint it into doubleness."

"But," said Vincent, "it ought, in the latter

case, to be present also when the eyes are shut. How is that?"

"I am not sure as to that, for I have been told by one person that her waking visions were seen with either eye, and with both, and that they could not be doubled by squinting, and were lost when the eyes were closed."

"And how do you explain that?"

"I do not yet. The patient was a remarkably intelligent woman, but hysterical, and the very suspicion of this puts one on guard, because these people delight to be considered peculiar, and their testimony must always be carefully studied, and tested by that of others."

"Tell us what she saw," said Mrs. Vincent.

"It is interesting, but I must cut it short. At eleven daily a gigantic black man entered the room with a huge bass viol, set it in a corner, and went out. Presently a second brought in an open coffin in which lay the patient herself. A little later a host of tiny men, all in red medieval dresses, swarmed out of the cracks of the viol, ran to the coffin, planted ladders against it, sat in hordes on its upper edges, and, lowering on the outside tiny buckets, brought them up full of tinted sand. This they threw into the coffin until it reached the face of the figure within. At this moment the patient began to breathe with difficulty, and then of a sudden the pygmies emptied the coffin as quickly as they had filled it, and scuttled away into the viol, while the two blacks returned and took it away with the coffin."

"What an extraordinary story!" said St. Clair.

"Can you explain it all?"

"Yes, in a measure; but it is hardly worth while. And as for ghosts, the honest old-fashioned ghosts, does any one believe in them?"

"I do," said our hostess.

"And I do not," returned Clayborne.

"But do you believe anything?" cried St. Clair.

"Yes," said Clayborne; "I believe there was a past, is a present, will be a future. And as to the rest—"

"Granted the past. As to the future," said St. Clair, "you cannot prove that it will be. But there is no present, because that implies rest of a moving world, swinging round with a moving solar system. It is a mere word."

"What! what! what!" cried Clayborne, suddenly contemplative.

"And, after all," said Mrs. Vincent, "we have had no really curdling ghost-story. Only nineteenth-century explanations."

"It is dangerous to tell a ghost-story nowadays," I returned. "A friend of mine once told one in print out of his wicked head, just for the fun of it. It was about a little dead child who rang up a doctor one night, and took him to see her dying mother. Since then he

has been the prey of collectors of such marvels. Psychological societies write to him; anxious believers and disbelievers in the supernatural assail him with letters. He has written some fifty to lay this ghost. How could he predict a day when he would be taken seriously?"

"I am very sleepy," said Mrs. Vincent, "and it is near to twelve. You have not had the smoke you are all hungering after."

"Clearly the character doctor must wait," said I.

"That may," she replied; "but not one of you can have a cigar until I hear a real ghost-story."

"Well," I said, "come close to me, all of you, and I will ransom the party."

"Oh, this is too delightful!" exclaimed Mrs. Vincent.

"It is serious, Clayborne," I said; "you might take notes."

"Preposterous!" he cried. "Might I not have even a cigarette at the window?"

"Not a whiff," said she; "I have heard that smoke acts on ghosts most injuriously."

"A ghost-smudge!" cried Vincent. "That is good."

"Suppose we get through with this thing," groaned the historian.

"It is brief," I returned.

"One morning, last autumn, I found on my breakfast-table a card, 'Alexander Gavin MacAllister, M. D., Edinburgh.' I know the man well. An able, sturdy Scot, given to usquebaugh. He had a large practice among the mechanic classes, and frequently consulted me. If a friend desired to annoy him, he had but to address him as Gavin. 'Gavin I was creesened, and that 's my name.' He would have fought on this, or for the honor of Scotland, or any man who thought Burns a lesser poet than Shakspeare. My servant said he had been waiting two hours. I said, 'Show him in.'

"'Ah, MacAllister,' I said, 'sit down. I did not want you to wait. Talk away while I eat my breakfast; or, will you have some?'

"'Nae bite, sir,' and after I had sent the servant away, 'I 'm in vara deep waters. I hae killed a mon last night, and I hae done it of knowledge.'

"I looked at him curiously. Eyes, hair, beard, skin, were all of various tints of red. All 'burned a burning flame together.' Also he was wet with the sweat of terror.

"'Let me hear,' I said. 'A little whisky?'

"'Nae drap, sir. I hae a deep fear that 's the witch seduced me. I 'm of opinion that wheesky must hae petticoats, there 's such an abidin' leaven of meeschief in her soceiety. I maun try to tell you, but I 'm nigher prayin' than talkin'. Ghosts and warlocks are nae quietin' company.'

“Go on,” I said.

“Dinna ye ken Mr. Gillespie, the banker?”

“Yes; I see that it was reported that he died in San Francisco two days ago.”

“It is so related. But I maun tell ye the hale case.”

“Go on.”

“Last night I hae reason to suspect that I maun hae been takin’ bad wheesky. It was nae the honest barley; I blame the rye. It’s a warnin’ to me for life, if the gude Lord spares me to reform. Ye see, yestreen, after the Thistle Society, I went to the St. Andrew’s dinner. By ill fortune Mr. McGillivray sat opposite to me. Aiblins yeken Mr. McGillivray. The mon has nae havin’s, which is to say manners. He made a very opprobrious remark concernin’ the True Kirk. By reason of too mony venous counselors, I had na the recht word to han’. And thinkin’ he might na understond me correctly if I bided too long, I cast a bannock at his foul face. A gude bittie haggis he threw at me. I wad na hae dune that to a dog. The beast has nae sentement of nationality (it’s but a Lowlander he is, after a’). A watermelon he got for answer to his remark. It broke on his bald head, and the sinner went doun in gore, or the like of it, after the manner of the mon Siserà. And that terminated the conversation vara sateesfactorily.

“The cheerman made a point of order that I, Alexander MacAllister, was drunk, and I was over-persuaded by five men to gae hame. When I got in, there on my slate was a message to go at once to veesit Mr. Gillespie, at No. 9 St. Peter’s Place. Vara ill, it said.

“Ye ken the mon’s deid. I dinna ken why I went, but the next I remember I was at his door. There were lichts in the house, and a braw hussy of a maid let me in. Preesently I was in a bedroom, and there sat Mr. Gillespie, vara white, but dressed.

“‘Tak’ a seat, Gawin,” he said, and I sat doun.

“Then he said, ‘Gawin, yer owin’ me a year’s reent.’”

“‘Oh, aye,’ I said.

“‘I am deid,’ said he, ‘and the executors will be hard. Now, Gawin, I want you to gie me a gude dose of poison.’”

“‘But you’re deid now,’ I said, and my hair stood up like flax stubble, that stiff with fear.

“‘I was a vara eccentric mon in the fleesh,’ he said, ‘and I’m nae less in the speerit. It has occurred to me, Gawin, an I were weel poisoned I might die as a ghaist, and get alive again. Dinna ye see the point, mon?’”

“‘I said, ‘That is aye gude logic,’ and ye ken he was a vara ingenious creature. ‘But war would be my neck for takin’ the life of a mon?’”

“‘I’m nae a mon, Gawin,’ he said; ‘I’m a ghaist, and it’s only a change of state I’m cravin’. And there’s the reent. But ye maun mak’ haste, or I will call in Doctor O’Beirne.’”

“‘Gude Lord!’ I said, ‘ye canna mean that, Mr. Gillespie. There’s a hantle of deaths at yon mon’s door.’”

“‘Then he’s the practitioner for me. I canna be waur. My time’s short; I was streatik yestreen, and to-morrow I shall be put awa’ in the ground. And there’s the reent.’”

“‘Wull ye forgie me the arrears?’ I said.

“‘I wull.’ •

“‘So I pulled out my little pocket-case, and mixed him enough strychnia to kill the ghaist of a witch’s cat. He took it doun wi’ a gulp.

“‘It’s rather constreengent,’ he said, and yon were his vara last words; and then he fell doun in a spawsm, and tied himself into bow-knots, and yelled—O Lord! sir. I fled like Tam O’Shanter, and here I am. I hae killed a mon.’”

“‘And then you went home?’”

“‘That may be, sir. When I cam’ to full knowleedge of Alexander MacAllister I was seated on the step of my door in the snaw. I went in, and—will ye credit it?—the slate was clean. But that maun be the way wi’ ghaist-writin’. It’s nae abidin’.’”

“‘But the man is alive, Gawin. There is a telegram in the morning papers to say that the report of his death was a mistake. He had a faint spell or a trance—something of the kind. He will be at home next week. You must have been very drunk, Gawin.’”

“‘I dinna ken. And there’s the reent, and I saw it. Sir, a ghaist in spawsm’s. Nae, nae; it was nae a coeocidence. Dinna ye think, sir, considerin’ the service, a gude bill for the reent and arrears would be but just?’”

“‘Certainly,’ I said; ‘he ought to pay.’”

“‘I hae muckle doubt as to the matter. If he forgies me the moneys, I’ll stondb by the Kirk against the whole clan of the McGillivrays to the mortal end of my days. Might I hae a drop o’ wheesky? No matter what kind. I’ll neever blaspheme against the rye again—there’s waur things.’”

“‘Delightful!’ cried Mrs. Vincent. ‘You have earned your cigar,’ and we broke up amidst laughter in which even Clayborne joined.

## OL' PAP'S FLAXEN.

BY HAMLIN GARLAND,

Author of "Main Traveled Roads," "Jason Edwards," etc.

IT was in June, just before the ending of the school, that Flaxen first began to write about delaying her return. Anson was woe-fully disappointed. He had said all along that she would make tracks for

home just as soon as school was out, and he had calculated just when she would arrive; and on the second day after the close of school for the summer he drove down to the train to meet her. She did not come, but he got a letter which said that one of her friends wanted her to stay two weeks with her, until after the Fourth of July.

"She's an awful nice girl, and we will have a grand time; she has a rich father and a piano and a pony and a buggy. It will just be grand."

"I don't blame her none," sighed Anson to Bert. "I don't want her to come away while she's enjoyin' herself. It'll be a big change fer her to come back an' cook fer us old moss-backs after bein' at school an' in good company all these months."

He was plainly disturbed. Her vacation was going to be all too short at the best, and he was so hungry for the sight of her! Still he could not blame her for staying under the circumstances; as he told Bert, his feelings did not count. He just wanted her to get all she could out of life; "there ain't much anyway for us poor devils, but what little there is we want her to have." The Fourth of July was the limit of her stay, and on the sixth, seventh, and eighth Anson drove regularly to the evening train to meet her.

On the third day another letter came, saying that she would reach home the next Monday. With this Anson rode home in triumph. During the next few days he went to the barber's and had his great beard shaved off. "Made me look so old," he explained, seeing Bert's wild start of surprise. "I've be'n carryin' that mop o' hair round so long I'd kind o' got into the notion o' bein' old myself. Got a kind o' crick in the back, ye know. But I ain't; I ain't ten years older 'n you be."

And he was not. His long blond mustache, shaved beard, and clipped hair made a

new man of him, and a very handsome man, too, in a large way. He was curiously embarrassed by Bert's prolonged scrutiny, and said jocosely:

"We've got to brace up a little now. Company boarders comin', young lady from St. Peter's Seminary, city airs an' all that sort o' thing. Don't you let me see ye eatin' pie with your knife. I'll break the shins of any man that feeds himself with anythin' 'cept the silver-plated forks I've bought."

Flaxen had been gone almost a year, and a year counts for much at her age. Besides Anson had exaggerated ideas of the amount of learning she could absorb in a year at a boarding-seminary, and had also a very vague idea of what "society" was in St. Peter, although he seemed suddenly to awake to the necessity of "bracing up" a little, and getting things generally into shape. He bought a new suit of clothes and a second-hand two-seated carriage, notwithstanding the sarcastic reflection of his partner, who was making his own silent comment upon this thing.

"The paternal business is *auskerspeelt*," he said to himself. "Ans' is goin' in on shape now. Well, it's all right; nobody's business but ours. Let her go, Smith; but they won't be no talk in this neighborhood when they get hold of what 's goin' on — oh, no!" He smiled grimly. "We can stand it, I guess; but it'll be hard on her. Ans' is a little too previous. It's too soon to spring this trap on the poor little thing."

They stood side by side on the platform the next Monday when the train rolled into the station at Boomtown, panting with fatigue from its long run. Flaxen caught sight of Bert first as she sprang off the train, and, running to him, kissed him without much embarrassment. Then she looked around, saying:

"Where 's ol' pap? Did n't he —"

"Why, Flaxen, don't ye know me?" he cried out at her elbow.

She knew his voice, but his shaven face, so much more youthful, was so strange that she knew him only by his eyes laughing down into hers. Nevertheless she kissed him doubtfully.

"Oh, what've you done? You've shaved off your whiskers; you don't look a bit natural — I —"

She was embarrassed, almost frightened, at the change in him. He "looked so queer"; his fair, untroubled, smiling face and blond mustache made him look younger than Bert.

"Nev' mind that! She 'll grow again if ye like it better. Get int' this new buggy—it 's ours. They ain't no flies on us to-day; not many," said Ans' in high glee, elaborately assisting her to the carriage, not appreciating the full meaning of the situation.

As they rode home he was extravagantly gay. He sat beside her, and she drove, wild with delight at the prairie, the wheat, the gulls, everything.

"Ain't no dust on our clo'es," said Ans', coughing, winking at Bert, and brushing off with an elaborately finical gesture an imaginary fleck from his knee and elbow. "Ain't we togged out? I guess nobody said 'boo' to us down to St. Peter, eh?"

"You like my clo'es?" said Flaxen, with charming directness.

"You bet! They 're scrumptious."

"Well, they ought t' be; they 're my best, except my white dress. I thought you 'd like 'em; I wore 'em a-purpose."

"Like 'em? They 're — you 're jest as purty as a red lily er a wild rose in the wheat — ahem! Ain't she, Bert, ol' boy? We 're jest about starvin' to death, we are."

"I knew you 'd be. What 'll I stir up for supper? Biscuits?"

"Um, um! Say, what ye s'pose I 've got to go with 'em?"

"Honey."

"Oh, you 're too sharp," wailed Ans', while Flaxen went off into a peal of laughter. "Say, Bert 's be'n in the *darnedest* — excuse me — plaguedest temper fer the last two months you ever did see."

While this chatter was going on Bert sat silent and unsmiling on the back seat. He was absorbed in seeing the exquisite color that played in her cheek, and the equally charming curves of her figure. She was well dressed, and was wonderfully mature. He was saying to himself: "Ans' ain't got no more judgment than a boy. We can't keep that girl here. More 'n that, the girl never 'll be contented again, unless—" He did not allow himself to go further. He did not yet dare even to think further.

They had a merry time that night, quite like old times. The biscuits were light and flaky, the honey was delishtsome, and the milk and butter (procured specially) were fresh. What peals of laughter as Flaxen insisted on their eating potatoes with a fork, and opposed the use of the knife in scooping up the honey from their plates! Even the saturnine Bert forgot his gloom and laughed too, as Ans' laboriously

dipped his honey with a fork, and, finally growing desperate, split a biscuit in half, and in the good old boyish way sopped it in the honey.

"There, that 's the Christian way of doing things!" he exulted, while Flaxen laughed. How bright she was! how strange she acted! There were moments when she embarrassed them by some new womanly grace or accomplishment, some new air which she had caught from her companions or teachers at school. It was truly amazing how much she had absorbed outside of her regular studies. She indeed was no longer a girl; she was a young woman, and to them a beautiful one.

Not a day passed without some added surprise which made Anson exult and say, "She 's gettin' her money's worth down there, no two ways about that."

But as the excitement of getting back died out, poor Flaxen grew restless, moody, and unaccountable. Before, she had always been the same cheery, frank, boyish creature. As Bert said, "You know where to find her." Now she was full of strange tempers and moods. She would work most furiously for a time, and then suddenly fall dreaming, looking away out on the shimmering plain toward the east.

At Bert's instigation, a middle-aged widow had been hired, at a fabulous price, to come and do the most of the work for them, thus releasing Flaxen from the weight of the hard work, which perhaps was all the worse for her. Hard work might have prevented the unbearable, sleepless pain within. She hated the slatternly Mrs. Green at once for her meddling with her affairs, though the good woman meant no offense. She was jocose in the broad way of middle-aged persons, to whom a love-affair is legitimate food for railery.

But Gearheart's keen eye was on Flaxen as well. He saw how eagerly she watched for the mail on Tuesdays and Fridays, and how she sought a quiet place at once in order to read and dream over her letters. She was restless a day or two before a certain letter came, with an eager, excited, expectant air. Then, after reading it, she was absent-minded, flighty in conversation; then listlessly restless, moving slowly about from one thing to another, in a kind of restless inability to take interest in anything for long.

All this, if it came to the attention of Anson at all, was laid to the schooling the girl had had.

"Of course it 'll seem a little slow to you, Flaxie, but harvestin' is comin' on soon, an' then things 'll be a little more lively."

But Gearheart was not so slow-witted. He had had sisters and girl cousins, and knew "the symptoms," as Mrs. Green would have put it. He noticed that when Flaxen read

her letters to them there was one which she never read. He knew that this was the letter which meant the most to her. He saw how those letters affected her, and thought he had divined in what way; and one day when Flaxen, after reading her letters, sprang up and ran into her bedroom, her eyes filled with sudden tears, Gearheart crooked his finger at Ans', and they went out to the barn together.

It was nearly one o'clock on an intolerable day peculiar to the Dakota plain. A frightfully hot, withering, and powerful wind was abroad, the thermometer stood nearly a hundred in the shade, and the wind, so far from being a relief, was suffocating because of its heat and the dust it swept along with it.

The heavy-headed grain and russet grass writhed and swirled as if in agony, and dashed high in waves of green and yellow. The corn-leaves had rolled up into long cords like the lashes of a whip, and beat themselves into tatters on the dry, smooth spot their blows had made beneath them; they seemed ready to turn to flame in the pitiless, furnace-like blast. Everywhere in the air was a silver-white, impalpable mist, which gave to the cloudless sky a whitish cast. The glittering gulls were the only things that did not move listlessly and did not long for rain. They soared and swooped, exulting in the sounding wind; now throwing themselves upon it, like a swimmer, then darting upward with miraculous ease, to dip again into the shining, hissing, tumultuous waves of the grass.

Along the roads prodigious trains of dust rose hundreds of feet in the air, and drove like a vast caravan with the wind. So powerful was the blast that men hesitated about going out with carriages, and everybody watched feverishly, expecting to see fire break out on the prairie and sweep everything before it. Work in the fields had stopped long before dinner, and the farmers waited, praying or cursing, for the wheat was just at the right point to be blighted.

As the two men went out to the shed side by side, they looked out on the withering wheat-stalks and corn-leaves with gloomy eyes.

"Another day like this, an' they won't be wheat enough in this whole county to make a cake," said Anson, with a calm intonation which after all betrayed the anxiety he felt. They sat down in the wagon-shed near the horses' mangers. They listened to the roar of the wind and the pleasant sound of the horses a good while before either of them spoke again. Finally Bert said sullenly:

"We can't put up hay such a day as this. You could n't haul it home under lock an' key while this infernal wind is blowin'. It's gittin' worse, if anythin'."

Anson said nothing, but waited to hear what Bert had brought him out here for. Bert speared away with his knife at a strip of board. Anson sat on a wagon-tongue, his elbows on his knees, looking intently at the grave face of his companion. The horses ground cheerily at the hay.

"Ans', we 've got to send Flaxen back to St. Peter; she 's so homesick she don't know what to do."

Ans's eyes fell.

"I know it. I 've be'n hopin' she 'd git over that, but it 's purty tough on her, after bein' with the young folks in the city fer a year, to come back here on a farm—" He did not finish for a moment. "But she can't stand it. I 'd looked ahead to havin' her here till September, but I can't stand it to see her cryin' like she did to-day. We 've got to give up the idee o' her livin' here. I don't see any other way but to sell out an' go back East somewhere."

Bert saw that Anson was still ignorant of the real state of affairs, but thought he would say nothing for the present.

"Yes; that 's the best thing we can do. We 'll send her right back, an' take our chances on the crops. We can git enough to live on an' keep her at school, I guess."

They sat silent for a long time, while the wind tore round the shed, Bert spearing at the stick, and Anson watching the hens as they vainly tried to navigate in the wind. Finally Anson spoke:

"The fact is, Bert, this ain't no place fer a woman, anyway—such a woman as Flaxen 's gittin' to be. They ain't nothin' goin' on, nothin' to see er hear. You can't expect a girl to be contented with this country after she 's seen any other. No trees; no flowers; jest a lot o' little shanties full o' flies."

"I knew all that, Ans', a year ago. I knew she 'd never come back here, but I jest said, it 's the thing to do—give her a chance, if we don't have a cent; now let 's go back to the house an' tell her she need n't stay here if she don't want to."

"Wha' d' ye s'pose was in that letter?"

"Could n't say. Some girl's description of a picnic er somethin'." Bert was not yet ready to tell what he knew. When they returned to the house the girl was still invisible, in her room. Mrs. Green was busy clearing up the dinner dishes.

"I don't know 's I ever see such a wind back to Michigan. Seems as if it 'u'd blow the hair off yer head."

"Oh, this ain't nothin'. This is a gentle zephyr. Wait till ye see a wind."

"Wal, I hope to goodness I won't never see a wind. Zephyrs is all I can mortally stand."

Anson went through the little sitting-room, and knocked on Flaxen's door.

"Flaxie, we want to talk to ye." There was no answer, and he came back and sat down. Bert pointed to the letter which Flaxen had flung down on the table. The giant took it, folded it up, and called, "Here 's yer letter, babe."

The door opened a little, and a faint, tearful voice said:

"Read it, if ye want to, boys." Then the door closed tightly again, and they heard her fling herself on the bed. Anson handed the letter to Bert, who read it in a steady voice.

DEAR DARLING: I have good news to tell you. My uncle was out from Wisconsin to see me, and he was pleased with what I had done, and he bought out Mr. Ford, and gave me the whole half interest. I 'm to pay him back when I please. Ain't that glorious? Now we can get married right off, can't we, darling?—so you just show this letter to your father and tell him how things stand. I 've got a good business. The drug-store is worth \$1200 a year,—my half,—but knock off fifty per cent. and we could live nicely. Don't you think so? I want to see you so bad and talk things over. If you can't come back soon, I will come on. Write soon.

Yours till death, WILL.

From the first word Anson winced, grew perplexed, then suffered. His head drooped forward on his hands, his elbows rested on his vast, spread knees. He drew his breath with a long, grieving gasp. Bert read on steadily to the end, then glanced at his companion with a deep frown darkling his face; but he was not taken by surprise. He had not had paternal passion change to the passion of a lover only to have it swept down like a half-opened flower. For the first time in his life the giant writhed in mental agony. He saw it all. It meant eternal separation. It meant a long ache in his heart which time could scarcely deaden into a tolerable pain.

Gearheart rose and went out, unwilling to witness the agony of his friend, and desiring himself to be alone. Anson sat motionless, with his hands covering his wet eyes, going over the past and trying to figure the future. He began in that storm: felt again the little form and face of the wailing babe; thought of the frightful struggle against the wind and snow; of the touch of the little hands and feet; of her pretty prattle and gleeful laughter; then of her helpful and oddly womanish ways as she grew older; of the fresh, clear voice calling him "pap," and ordering him about with a roughish air; of her beauty now, when for the first time he had begun to hope that she might be something dearer to him.

How could he live without her? She had grown to be a part of him. He had long ceased to think of the future without her. As he sat

so, the bedroom door opened, and Flaxen's tearful face looked out at him. He did not seem to hear, and she stole up to him and, putting her arm around his neck, laid her cheek on his head—a dear, familiar, childish gesture, used when she wished to propitiate him. He roused himself, and put his arm about her waist, tried to speak, and finally said in a sorry attempt at humor, woefully belied by the tears on his face and the choking in his throat:

"You tell that feller—if he wants ye, to jest come an'—git ye—that 's all!"

ANSON'S opinion of Mr. Kendall was not favorable, but he held it to be a sort of treason to Elga to think so, and he would not admit it to himself or to Gearheart. They saw Kendall for the first time on the day of the wedding, which came in September. They made some inquiries of the townspeople, and found that he was a harmless little creature enough, small, a little inclined to bow-legs, and dudish in manner. He combed his hair till it shone like ebony, and wore the latest designs in standing collars high on his slim neck. His hands were beautifully small and white and ringed, and he had the engaging manners of a successful dry-goods clerk.

"He can't abuse her, that 's one good thing about the whelp," thought Bert, as he crushed Kendall's slim, lax hand in his just to see him scringe.

As for the bridegroom, he was not a little afraid of these fellows, so big and so sullen, and tried his best to please them, chirping in his bright way of all kinds of things.

"We 're one of the best cities on the river, you see. Could n't be a better place for a business stand, don't you know? And we 're getting to the front in our wholesale department. Of course—ha! ha!—my wife's father ought to know how I am getting on, so you 're welcome to come in and look over my books. Our trade is a cash trade as far as the retail part goes, and we are mighty careful who gets tick from us on the wholesale trade. The wholesale trade we are developing rapidly, and in less than ten years we will be one of the leading firms in the valley."

Elga had been down to St. Peter with her friends the Holts since that week before harvest when Anson "discovered the lay of the land." It cut him terribly to see how eager she was to get away, and he grew a little bitter, a thing quite unusual for him.

"What 's that little whipper-snapper ever done fer her that she should leave us in the shade fer him; forget all we 've done fer her, an' climb out an' leave us jest at his wink? It beats me; but it 's all right. I don't blame her if she feels so; only it does seem queer, don't it?"

"Purty tough, sure 's yer born. Specially the idee that after bein' raised with a couple o' men she 'd go off with a thing like that."

Arriving at this understanding, they said no more about it, but set to work to make it all as pleasant for Flaxen as possible.

Anson stood bravely through the ceremony as the father of the bride, and bore himself with his usual massive rude dignity. But he inwardly winced as he saw Elga, looking very stately and beautiful in her bride's veil, towering half a head above the sleek-haired little clerk. Not a few of the company smiled at the contrast, but she had no other feeling than perfect love and happiness.

When the ceremony was over, and Anson looked around for Bert, he was gone. He could n't stand the pressure of the crowd and the whispered comments, and had slipped away early in the evening.

Among the presents which were laid on the table in the dining-room was a long envelop addressed to Mrs. Will Kendall. It contained a deed for a house and lot in one of the most desirable parts of the suburbs. It was from Gearheart, but there was no written word else. This gift meant the sale of his claim in Dakota.

When Anson got back to the hotel that night, wondering and alarmed at his partner's absence, he found a letter from him. It was full of his well-known bitterness.

This climate is getting too frigid for my lungs. I'm going to emigrate to California. I made a mistake; I ought to have gone in for stand-up collars, shiny hair, and bow-legs. You 'd better skip back to Dakota and sell your claim. Keep my share of the stock and tools; it ain't worth bothering about. Don't try to live there alone, old man. If you can't sell, marry. Don't let that girl break you all up too. We are all fools, but some can get over it quicker than others.

If that little bow-legged thing gets under your feet or abuses her, just get your toe under him and hoist him over into the alley.

Good-by and good luck, old man. BERT.

And the next day the doubly bereaved man started on his lonely journey back to the Dakota claim, back to an empty house, with a gnawing pain in his heart and a constriction like an iron band about his throat; back to his broad fields to plod to and fro alone.

As he began to realize it all, and to think how terrible was this loss, he laid his head down on the car-seat before him, and cried. His first great trial had come to him, and, meeting it like a man, he must now weep like a woman.

### III.

FLAXEN wrote occasionally during the next year, letters all too short and too far between

for the lonely man toiling away on his bleak farm. These letters were very much alike, telling mainly of how happy she was, and of what she was going to do by and by, on Christmas or Thanksgiving. Once she sent a photograph of herself and husband, and Anson, after studying it for a long time, took a pair of shears and cut the husband off, and threw him into the fire.

"That fellow gives me the ague," he muttered.

Bert did not write, and there was hardly a night that Ans' lay down on his bed that he did not wonder where his chum was, especially as the winter came on unusually severe, reminding him of that first winter in the Territory. Day after day he spent alone in his little house, going out only to feed the cattle or to get the mail. But with the passage of time the pain in his heart lost its intensity.

One day he got a letter from Flaxen that startled and puzzled him. It was like a cry for help, somehow.

"Dear old pap, I wish you was here," and then in another place came the piteous cry, "Oh, I wish I had some folks!"

All night long that cry rang in the man's head with a wailing, falling cadence like the note of a lost little prairie-chicken.

"I wonder what that whelp has been doin' now. If he 's begun to abuse her I 'll wring his neck. She wants me an' da's n't ask me to come. Poor chick, I 'll be pap an' mam to ye, both," he said at last, with sudden resolution.

The day after the receipt of this letter a telegram was handed to him at the post-office, which he opened with trembling hands.

ANSON WOOD: Your daughter is ill. Wants you. Come at once. DOCTOR DIETRICH.

A glorious winter sun was beginning to light up the frost foliage of the maples lining St. Peter's streets when Anson, stiff with cold and haggard with a night of sleepless riding, sprang off the train and looked about him. The beauty of the morning made itself felt even through his care. These rows of resplendent maples, heavy with iridescent frost, were like fairy-land to him, fresh from the treeless prairie. As he walked on under them, showers of powdered rubies and diamonds fell down upon him; the colonnades seemed like those leading to some enchanted palace such as he had read of in boyhood. Every shrub in the yards was similarly decked, and the snug cottages were like the little house which he had once seen at the foot of the Christmas tree in a German church years before.

Feet crunched along cheerily on the sidewalks, bells of dray-teams were beginning to sound, and workmen to whistle.

Anson was met at the door by a hard-faced, middle-aged woman.

"How 's my girl?" he asked.

"Oh, she 's nicely. Walk in."

"Can I see her now?"

"She 's sleepin'; I guess you better wait a little while till after breakfast."

"Where 's Kendall?" was his next question.

"I d'n' know. Hain't seen 'im sence yesterday. He don't amount to much, anyway, and in these cases there ain't no dependin' on a boy like that. It 's nachel fer girls to call on their mothers an' fathers in such cases."

Anson was about to ask her what the trouble was with his girl, when she turned away. She could not be dangerously ill; anyway, there was comfort in that.

After he had eaten a slight breakfast of bad coffee and yellow biscuits, Mrs. Stickney came back.

"She 's awake an' wants to see ye. Now don't get excited. She ain't dangerous."

Anson was alarmed and puzzled at her manner.

"What is the matter?" he demanded.

Her reply was common enough, but it stopped him with his foot on the threshold. He understood at last. The majesty and mystery of birth was like a light in his face, and dazzled him. He was awed and exalted at the same time.

"Open the door; I want to see her," he said in a new tone.

As they entered the darkened chamber he heard his girl's eager cry.

"Is that you, pap?" wailed her faint, sweet voice.

"Yes; it 's me, Flaxie." He crossed the room, and knelt by the bed. She flung her arms around his neck.

"O pappy, pappy! I wanted you. Oh, my poor mama! O pap, I don't like her," she whispered, indicating the nurse with her eyes. "O pap, I hate to think of mother lying there in the snow—an' Bert—where is Bert, pap? Perhaps he 's in the blizzard too—"

"She 's a little flighty," said the nurse in her matter-of-fact tone.

Anson groaned as he patted the pale cheek of the sufferer.

"Don't worry, Flaxie; Bert 's all right. He 'll come home soon. Why don't you send for the doctor?" he said to the nurse.

"He 'll be here soon. Don't worry over that," indicating Flaxen, who was whispering to herself.

"Do you s'pose I can find my folks if I go back to Norway?" she said to Anson a little after.

"Yes; I guess so, little one. When you get well, we 'll try an' see."

"Perhaps if I found my aunt she 'd look like mama, an' I 'd know then how mama looked, would n't I? Perhaps if the wheat is good this year we can go back an' find her, can't we?" Then her words melted into a moan of physical pain, and the nurse said:

"Now I guess you 'd better go an' see if you can't hurry the doctor up. Yes; now he 's got to go," she went on to Flaxen, drowning out her voice and putting her imploring hands back upon the bed.

Anson saw it all now. In her fear and pain she had turned to him,—poor motherless little bird,—forgetting her boy husband, or feeling the need of a broader breast and stronger hand. It was a beautiful trust, and as the great shaggy man went out into the morning he was exalted by the thought. "My little babe—my Flaxen!" he said with unutterable love and pity.

Again his mind ran over the line of his life—the cabin, the dead woman, the baby face nestling at his throat, the girl coming to him with her trials and triumphs. His heart swelled so that he could not have spoken, but deep in his throat he muttered a dumb prayer. And how he suffered that day, hearing her babble mixed with moanings every time the door opened. Once the doctor said:

"It 's no use for you to stand here, Wood. It only makes you suffer, and don't help her a particle."

"It seems 's if it helped her, an' so—I guess I 'll stay. She may call fer me, an' if she does I 'm goin' in, doctor. How is she now?"

"She 's slightly delirious now, but still she knows you 're here. She now and then speaks of you, but does n't call for you."

But she did call for him, and he went in, and, kneeling by her side, he talked to her and held her hands, stroked her hair and soothed her as he used to when a little child unable to speak save in her pretty Norseland tongue, and at last when opiates were given, and he rose and staggered from the room, it seemed as though he had lived years.

So weary was he that when the doctor came out and said, "You may go to sleep now," he dropped heavily on a lounge and fell asleep almost with the motion. Even the preparations for breakfast made by the hoarse-voiced servant-girl did not wake him, but the drawling, nasal tone of Kendall did. He sat up and looked at the oily little clerk. It was after seven o'clock.

"Hello!" said Kendall, "when d' you get in?"

"Shortly after you went out," said Anson in reply.

Kendall felt the rebuke, and, as he twisted his cuffs into place, said, "Well, ye see I could n't do no good—a man ain't any good in such

cases, anyway — so I just thought I'd run down to St. Paul an' do a little buying."

Anson turned away and went into the kitchen to wash his face and to comb his hair, glad to get rid of the sight of Kendall for a moment. Mrs. Stickney was toasting some bread.

"She's awake an' wants to see you when you woke up. It's a girl — thought I'd tell ye — yes; she's comfortable. Say, 'tween you an' me, a man 'at 'u'd run off — waal —" she ended expressively.

Once more Anson caught his breath as he entered the darkened chamber. But the figure on the bed was tranquil now, and the voice, though weak and low, was Flaxen's own.

He stopped as his eyes fell on her. She was no longer a girl. The majesty of maternity was on her pale face and in her great eyes. A faint, expectant smile was on her lips, her eyes were fixed on his face as she drew the cover from the little red, weirdly wrinkled face at her throat.

Before he could speak, and while he was looking down at the mite of humanity, Kendall stepped into the room.

"Hello, Ellie! How are —"

A singular revulsion came out on her face. "Make him go 'way; I don't want him."

"All right," said Kendall, cheerfully, glad to escape.

"Isn't she beautiful?" the mother whispered.

"Does she look like me?" she asked artlessly.

"She's beautiful to me because she's yours, Flaxie," replied Anson, with a delivery all the more striking because of the contrast with his great frame and hard, rough hands. "But there, my girl, go to sleep like baby, an' don't — worry any more."

"You ain't goin' away while I'm sick?" she asked, following him with her eyes unnaturally large.

"I won't never go 'way again if you don't want me to," he replied.

"Oh, I'm so glad!" she sighed restfully.

He was turning to go when she waited reproachfully, "Pap, you did n't kiss baby!"

Anson turned and came back. "She's sleepin', an' I thought it was n't right to kiss a girl without she said so."

This made Flaxen smile, and Anson went out with a lighter heart than he had had for two years. Kendall met him outside, and said confidentially:

"I don't s'pose it was just the thing for me to do; but — confound it! — I never could stand a sick-room, anyway. I could n't do any good, anyway — just been in the way. She'll get over her mad in a few days. Think so?"

But she did not. Her singular and sudden dislike of him continued, and though she passively submitted to his being in the room, she would not speak a word to him nor look at

him as long as she could avoid it; and when he approached the baby or took it in his arms a jealous frown came on her face.

As for Anson, he grew to hate the sound of that little chuckle of Kendall's; the part in the man's hair and the hang of his cutaway coat made him angry. The trim legs, a little bowed, the big cuffs hiding the small, cold hands, and the peculiar set of his faultless collar, grew daily more insupportable.

"Say, looky here, Kendall," said he in desperation one day, "I wish you did n't like me quite so well. We don't hitch fust-rate — at least I don't. Seems to me you 're neglectin' your business too much."

He was going to tell him to keep away, but he relented as he looked down at the harmless little man, with his thin, boyish face.

"Oh, my business is all right. Gregory looks after it mostly, anyhow. But, I say, if you wanted to go into the dray business, there's a first-class opening now. Clark wants to sell."

It ended in Anson seeing Clark and buying out his line of drays, turning in his claim toward the payment, a transaction which made Flaxen laugh for joy, for she had not felt certain before that he would remain in St. Peter. She was getting about the house now, looking very wifely in her long, warm wraps, her slow motions contrasting strongly with the old restless, springing steps Anson remembered so well.

Night after night, as he sat beside the fire and held baby, listening to the changed voice of his girl, and watching the grave new expressions of her face, the tooth of time took hold upon him powerfully, and he would feel his shaggy beard and think, "I'll soon be gray, soon be gray!" while the little one cooed, and sprang, and pulled at his beard, which had grown long again and had white hairs in it.

Kendall spent most of his time at the store, or down-town somewhere, and so all of those long, delicious winter evenings were Flaxen's and Anson's. And his enjoyment of them was pathetic. The cheerful little sitting-room, the open grate, the gracious, ever-growing womanliness of Elga, the pressure of soft little limbs, and the babble of a liquid baby-language, were like the charm of an unexpected Indian-summer day between two gray November storms.

One night Kendall did not come home, and early the next morning an officer came to the door to inquire if he were in. On being told that he was not at home, and that they did not know where he was, the sheriff said to his companion:

"Skipped between two days."

And so it came out that Kendall had purchased goods on credit, gambled his money

away, and was ruined. His stock of goods was seized, and the house was saved only through the firmness of Anson.

Flaxen shut her lips and said nothing, and he could not read her silence. One day she came to him with a letter.

"Read that!" she exclaimed scornfully. He saw that it was dated from Eau Claire, Wisconsin.

DEAR DARLING WIFE: I'm all right here with father. It was all Gregory's fault; he was always betting on something. I'm coming back as soon as the old man can raise the money to pay Fitch. Don't worry about me. They can't take the house, anyway. You might rent the house, sell the furniture on the sly, and come back here. The old man will give me another show. I don't owe more than a thousand dollars, anyway. Write soon. Your loving WILL.

Anson went quietly on with his work, making a living for himself and Flaxen and baby. It never occurred to either of them that any other arrangement was necessary. Kendall wrote once or twice a month for a while, saying each time, "I'll come back and settle up," and asking her to come to him; but she did not reply, and never referred to him outside her home, and when others inquired after him she replied evasively:

"He 's in Wisconsin somewhere; I don't know where."

"Is he coming back?"

"I don't know."

She often spoke of Bert, and complained of his silence. Once she said:

"I guess he 's forgot us, pap."

"I guess not. More likely he 's thinkin' we 've forgot him. He 'll turn up some bright mornin' with a pocket full o' rocks. He ain't no spring chicken, Bert ain't." ("All the same, I wish t' he 'd write," Anson said to himself.)

THE sad death of Kendall came to them without much disturbing force. He had been out of their lives so long that when Anson came in with the paper and letter telling of the accident, and with his instinctive delicacy left her alone to read the news, Flaxen was awed and saddened, but had little sense of personal pain and loss.

"Young Kendall," the newspaper went on under its scare-heads, "was on a visit to La Crosse, and while skating with a party on the bayou, where the La Crosse River empties into the father of waters, skated into an air-hole. The two young ladies with him were rescued, but the fated man was swept under the ice. He was the son," etc.

When Anson came back Flaxen sat with the letter in her hand and the paper on her lap.

She was meditating deeply, but what was in her mind Anson never knew. She had grown more and more reticent of late. She sighed, rose, and resumed her evening tasks.

One raw March evening, when the wind was roaring among the gray branches of the maples like a lion in wrath, some one knocked on the door.

"Come in!" shouted Anson, who was giving baby her regular ride on his boot.

"Come in!" added Flaxen.

Gearheart walked in slowly, and closed the door behind his back, and stood devouring the cheerful scene. He was poorly dressed, and wore a wide, limp hat; they did not know him till he bared his head.

"Bert!" yelled Anson, tossing the baby to his shoulder, and leaping toward his chum, tramping and shaking and clapping like a madman — scaring the child.

"My gosh-all-hemlock! I'm glad to see ye! Gimme that paw again. Come to the fire. This is Flaxie" (as though he had not had his eyes on her face all the time). "Be'n sick?"

Bert's hollow cough prompted this question.

"Yes. Had some kind of a fever down in Arizona. Oh, I'm all right now," he added in reply to an anxious look from Flaxen.

"An' this is—"

"Baby—Elsie," she replied, putting a finishing touch to the little one's dress, mother-like.

"Where 's he?" he asked a little later.

Anson replied with a little gesture which silenced Bert at the same time that it explained. And when Flaxen was busy a few moments later, Anson said:

"He 's gone. I 'll explain later."

At the table they grew quite gay talking over old times, and Bert's pale face grew rosier, catching a reflection of the happy faces opposite.

"Say, Bert, do you remember the time you threw that pan o' biscuits I made out into the grass an' killed every dog in the township?" Then they roared.

"I remember your flapjacks that always split open in the middle, an' no amount o' heat could cook 'em inside," Bert replied.

Then they grew sober again, when Bert said with a pensive cadence: "Well, I tell ye, those were days of hard work; but many 's the time I've looked back at 'em these last three years, wishin' they 'd never ended an' that we 'd never got scattered."

"We won't be again, will we, pap?"

"Not if I can help it," Anson replied. "But how are you, Bert? Rich?"

Bert put his hand into his pocket and laid a handful of small coins on the table.

"That 's the size o' my pile—four dollars,"

he said, smiling faintly; "the whole o' my three years' work."

"Well, never mind, ol' man. I've got a chance fer ye. Still an old bach.?"

"Still an old bach." He looked at Flaxen, irresistibly drawn to her face. She dropped her eyes; she could not have told why.

And so "Wood & Gearheart" was painted on the sides of the drays, and they all continued to live in the little yellow cottage, enjoying life much more than the men, at least, had ever dared to hope; and little Elsie grew to be a "great girl," and a nuisance with her desire to "yide" with "g'an'pap."

There is no spot more delightful in early April than the sunny side of the barn, and An's and Bert felt this though they did not say it.

The eaves were dripping, the doves cooing, the hens singing their harsh-throated, weirdly suggestive songs, and the thrilling warmth and vitality of the sun and wind of spring made the great rude fellows shudder with a strange delight. Anson held out his palm to catch the sunshine in it, took off his hat to feel the wind, and mused:

"This is a great world—and a great day. I wish t' it was always spring."

"Say," began Bert abruptly, "it seems pretty well understood that you 're her father—but where do I come in?"

"You ought to be her husband." A light leaped into the younger man's face. "But go slow," Anson went on gravely. "This package is marked 'Glass; handle with care.'"

THE END.

*Hamlin Garland.*

## ITALIAN OLD MASTERS.

BERNARDINO LUINI.—BORN, —; DIED, 1533 (?).

IT is a curious commentary on the artistic discrimination of the sixteenth century that one of the sweetest of its painters was so unknown in his own day that there is no record of his birth or of his death. We know so

little of Luini's life and circumstances that if we would have a biography, we must construct one from the internal evidence of his works. The first signed picture is a Madonna in the Brera Gallery of Milan, of 1521, and this seems to mark a point of departure, and serves to divide hypothetically his unripened work from that by which we estimate his powers. He has always been considered a pupil of Da Vinci, but we have no other evidence of this than the character of his work. Only six of his pictures are dated, moreover, so that we have hardly the data for an authoritative classification of them. The singular and salient fact of Luini's artistic existence is that for so many years he was so completely confounded with Da Vinci that there are more of his pictures which have passed for the work of Leonardo than we have of Leonardo's own. It is possible that the fixing of his style in 1521 was a consequence of his having come into contact with Da Vinci. That he did actually profit by the instruction of the master is most probable, for the similarity of technic which has been the cause of the confusion between the two painters could hardly have come merely from a general impression of the elder painter's work. Studio traditions are to be ac-

quired only in the studio; and Da Vinci had so many pupils that Luini and many others might easily escape mention. In that region and time the genius of the master so overshadowed all other talent or reputation that a man in poor circumstances, and of obscure position, such as Luini, would hardly attract the attention of a society accustomed to brilliant achievement and showy qualities, to which Luini never attained. His tender sentiment and delicate drawing are not of the kind of art which attracts the careless observer, and that his work has come down almost to our own day without the distinction it merits is the best proof that he was not of those who catch the public eye at any period.

The work supposed to be his earliest is in the Brera Gallery and the Royal Palace, Milan; it consists of a number of fragments of frescos from the Casa Pelucca near Monza. They are mostly subjects from the Old Testament, but there is a series of mythological subjects, as an Apollo and Daphne, etc. The frescos of Sta. Maria della Pace, which are now in the Brera, or in the Museum of Archæology, are supposed by Mongeri to have been painted about 1524, and to be the next in order to those of the Casa Pelucca, as they show the painter's peculiarities of style, while those of the former series vary so much as to have given the idea to Cavalcaselle that they were painted in coöperation with Suardi, whose children and those of Luini (the latter had three sons who became painters) painted in much the same manner. Luini was a poor man with a large family, and executed

a very great number of works, those of the earlier period being mostly, so far as distinguishable, in fresco, and, whether from haste, as a result of being poorly paid, or from being carried out by pupils, of very unequal execution. But he was capable of very rapid work; thus the "Flagellation" in the Ambrosiana, a fresco occupying one side of the chapter-hall, was begun in October, 1521, and finished in March of the next year. The "Flagellation" occupies the center, with portraits of six donors on each side, all excellent examples of portraiture.

After 1522 Luini was called out of Milan to work, and painted in Legnano an altar-piece in fifteen compartments. In 1525 he was invited to paint in the Church of the Blessed Virgin of Saronno, near Milan, where he worked in company with Gaudenzio and two other painters; and on his return to Milan he was commissioned by the Bentivogli, the dethroned lords of Bologna, to paint the partition wall of the Church of St. Maurizio, by which they wished to show their recognition, in their exile from their own realm, of the hospitality of their kinsmen the Sforzas. One of the subjects is St. Benedict leading Alessandro Bentivoglio to the altar, and another is St. Agnes performing the same office for his wife, who was Hippolyta Sforza. In the cloister of the church he painted a series from the Passion, of which the Crucifixion was in oil.

From Milan he went again, in 1529, to Lugano, where he painted a Passion, in which the principal scenes of the Agony are enacted in the background while the Crucifixion takes place in the foreground. Dohme considers the figures of the Magdalen and St. John to be among the finest in Italian art. Here the painter introduces as a centurion the supposed portrait of himself, and as the same head occurs in another picture, the "Adoration," at Saronno, Dohme very reasonably accepts it as the authentic portrait, rejecting the traditional portrait in the "Christ among the Doctors," in the Church of the Blessed Virgin of Saronno. There is record of his painting at Lugano in 1529-30 and in 1533, and the last date is the latest note of the existence of the painter.

Ruskin deserves the credit of having been one of the earliest to give Luini full justice. He considers him a better draftsman than Da Vinci, but this is a judgment the justice of which depends on definitions. If we are to take into consideration all the qualities of the artistic expression of form, it cannot be maintained, and in subtlety of line alone it can hardly be held, for when he had a form to follow no one could surpass Da Vinci; but in the feeling for beauty of line and tender expression coupled with subtle drawing, I believe that Luini justifies the praise of the critic.

*W. J. Stillman.*

NOTE BY TIMOTHY COLE ON THE "ST. APOLLONIA" OF LUINI.

LUINI is seen at his best in Milan, where are found his latest works—those of his third, or "blond," manner, in which he attains his fullest strength and independence. The Church of Monastero Maggiore, formerly St. Maurizio, is a very temple of his art.

Luini's "blond" manner is a warmer and less heavy style of coloring than he had previously practised; the name does not imply that his frescos are any more blond, generally speaking, than those of any other artist.

The detail given, St. Apollonia, is part of one of the painter's most beautiful single-figure pieces, a fresco to the right of the high altar in the Church of Monastero Maggiore. I was much struck with the grace and ease of the pose; but the beauty of the face, so tender and full of emotion, made me wish to engrave this part alone. I have made, however, a three-quarter length, thus giving the head larger than it would have been had I done the whole figure, as well as showing the composition of the principal motive. Much of the expression of a face is necessarily lost in engraving it on a small scale on wood.

The attribute of St. Apollonia is a pair of pincers holding a tooth, in allusion to the torture she suffered in having all her teeth extracted previously to being burned. She is the patron saint of sufferers from toothache. Besides the pincers, she holds the book as significant of her learning, and she bears the martyr's palm.

The fresco measures six feet high by two feet seven

inches wide. To appreciate the full value of the coloring one must get within the altar-railing, for the effect of the slanting light from without causes a delicate purple bloom to suffuse the whole of the surface, and this, though very beautiful, conveys a false impression. I had not suspected anything wrong until I got within the railing, when I found that the under-robe, which I had taken to be of a charming purple hue, was in fact dark brown. In like manner the other colors were more or less affected. The sleeve of the saint is pea-green, of a light, delicate, lively tone, soft and very pleasant to the eye. Her mantle which falls over her shoulder, is of a bright orange, yet neutralized to harmonize delightfully with the rest. The lining of this mantle, turned up by the elbow, is of a soft, neutral tone of blue. The lining of the robe falling beneath the arm is of the same tone of blue, but its exterior is of a fine crimson, softened and glowing. A portion of this robe falls over the left shoulder, displaying its lining of soft blue. The cover of the book is green. The background of the whole is of a soft, dark sea-green, its inner square of a soft blackish tone tinged delicately so as to suggest a reddish feeling. The hair of the saint is of a warm silvery color, and the flesh-tints are soft and warm. The combination of the whole is very delightful and charming. The best way to appreciate the beautiful glow of the picture is to stand at a little distance and to view it through a tube, shutting out all else, and thus concentrating the vision upon it.

### I. COUNTRY AND TOWN.

KENTUCKY is a land of rural homes. The people are out in the country with a perennial appetite and passion for the soil. Like Englishmen, they are by nature no dwellers in cities; like

older Saxon forefathers, they have a strong feeling for a habitation even no better than a one-story log house, with furniture of the rudest kind, and cooking in the open air, if only it be surrounded by a plot of ground and individualized by all-encompassing fences. They are gregarious at respectful distances, dear to them being that sense of personal worth and importance which comes from territorial aloofness, from domestic privacy, and from a certain lordship over all they survey.

The land that Kentuckians hold has a singular charm and power of infusing some fierce and tender desire of ownership. Centuries before it was possessed by them, all ruthless aboriginal wars for its sole occupancy had resolved them-

selves into the final understanding that it be wholly claimed by none. Bounty in land was the coveted reward of Virginia troops in the old French and Indian war. Hereditary love of land was the magnet that drew the earliest settlers across the perilous mountains. Rapacity for land was the impulse that caused them to rush down into the green plains, fall upon the natives, slay, torture, hack to pieces, and sacrifice wife and child, with the swift, barbaric hardihood and unappeasable fury of Northmen of old descending upon the softer shores of France. Acquisition of land was the determinative principle of the new civilization. Litigation concerning land has made famous the decisions of their courts of law. The surveyor's chain should be wrapped about the rifle as a symbolic epitome of pioneer history. It was for land that they turned from the Indians upon one another, and wrangled, cheated, and lied. They robbed Boone until he had none in which to lay his bones. One of the first acts of one of the first colonists was to glut his appetite by the purchase of all of the State that lies south of the

Kentucky River. The middle class of farmer has always been a strong, a controlling element of the population. To-day more are engaged in agriculture than in all other pursuits combined; taste for it has steadily drawn a rich stream of younger generations hither and thither into the younger West; and to-day, as always, the broad, average ideal of a happy life is expressed in the quiet ownership of perpetual pastures.

Steam, said Emerson, is almost an Englishman: grass is almost a Kentuckian. Wealth, labor, productions, revenues, public markets, public improvements, manners, characters, social modes—all speak in common of the country and fix attention upon the soil. The staples attest the predominance of agriculture; unsurpassed breeds of stock imply the verdure of the

features of urban life. The hundreds of little towns and villages scattered at easy distances over the State for the most part draw out a thin existence by reason of surrounding rural populations. They bear the pastoral stamp. Up to their very environs approach the cultivated fields, the meadows of brilliant green, the delicate woodlands; in and out along the white highways move the tranquil currents of rural trade; through their streets groan and creak the loaded wagons; on the sidewalks the most conspicuous human type is the farmer. Once a month county-seats overflow with the incoming tide of country folk, livery-stables are crowded with horses and vehicles, court-house squares become market-places for traffic in stock. But when emp-

DOWELL'S BRIDGE ON GLENN CREEK.

lawns; turnpikes, the finest on the continent, furnish viaducts for the garnered riches of the earth, and prove as well the high development of rural life as the every-day luxury of delightful riding and driving. Even the crow, the most boldly characteristic freebooter of the air, whose cawing is often the only sound heard in dead February days, or whose flight amid his multitudinous fellows forms long black lines across the morning and the evening sky, tells of fat pickings and profitable thefts in innumerable fields. In Kentucky a rustic young woman of Homeric sensibility will rightly be allowed to discover in the slow-moving panorama of white clouds her father's herd of short-horned cattle grazing through heavenly pastures, and her lover to see in the halo around the moon a perfect celestial race-track.

Comparatively weak and unpronounced are

tied of country folk, they sink again into repose, all but falling asleep of summer noonings, and in winter seeming frost-locked with the outlying woods and streams.

Remarkable is the absence of considerable cities; there being but one that may be said truly to reflect Kentucky life, and that situated on the river frontier, a hundred miles from the center of the State. Think of it! A population of some two millions with only one interior town that contains over five thousand white inhabitants. Hence Kentucky makes no impression abroad by reason of its urban population. Lexington, Bowling Green, Harrodsburg, Winchester, Richmond, Frankfort, Mount Sterling, and all the others, where do they stand in the scale of great American cities? Hence, too, the disparaging contrast liable to be drawn between Kentucky and the gigantic young States of the West.

DRAWN BY W. L. MACLEAN.

HOME OF THE SHELBYs, LINCOLN COUNTY.

ENGRAVED BY GEORGE P. BARTLE.

Where, it is severely asked, is the magnitude of the commonwealth, where the ground of the sense of importance in the people? No huge mills and gleaming forges, no din of factories and throb of mines, nowhere any colossal centers for the rushing enterprise and multiform energy of the modern American spirit. The answer must be, Judge the State thus far as an agricultural State; the people as an agricultural people: in time no doubt the rest will come. All other things are here, awaiting occasion and development. The eastern portions of the State now verge upon an era of long-delayed activity. There lie the mines, the building-stone, the illimitable wealth of timber; there soon will be opened new fields for commercial and industrial centralization. But hitherto in Kentucky it has seemed enough that the pulse of life should beat with the heart of nature, and be in unison with the slow unfolding and decadence of the seasons. The farmer can go no faster than the sun, and is rich or poor by the law of planetary orbits. In all central Kentucky not a single village of note has been founded within three quarters of a century, and some villages a hundred years old have not succeeded in gaining even from this fecund race more than a thousand or two thousand inhabitants. But these little towns are inaccessible to the criticism that would assault their commercial greatness. Business is not their boast. Sounded to its depths, the serene sea in which their exist-

tence floats will reveal a bottom, not of mercantile, but of social ideas; studied as to cost or comfort, the architecture in which the people have expressed themselves will appear noticeable, not in their business houses and public buildings, but in their homes. If these towns pique themselves pointedly on anything, it is that they are the centers of genial intercourse and polite entertainment. Even commercial Louisville must find its peculiar distinction in the number of its sumptuous private residences. It is well nigh a rule that in Kentucky the value of the house is out of proportion to the value of the estate.

Do not, however, make the mistake of supposing that because the towns regard themselves as the provincial fortresses of a good society, they therefore look down upon the home life

COLONEL HART GIBSON'S HOUSE, NEAR LEXINGTON.

ENGRAVED BY CHARLES STATE.

of the country. In fact, between country and town in Kentucky exists a relation unique and well to be understood: such a part of the population of the town owning or managing estates in the country; such a part of the population of the country being business or professional men in town. For it is strikingly true that here all vocations and avocations of life may and do go with tillage, and there are none it is not considered to adorn. The first governor of the State was awarded his domain for raising a crop of corn, and laid down public life at last to renew his companionship with the plow. "I retire," said Clay, many years afterward, "to the shades of Ashland." The present governor (1888), a man of large wealth, lives, when at home, in a rural log house built near the beginning of the century. His predecessor in office was a farmer. Hardly a man of note in all the past or present history of the State but has had his near or immediate origin in the woods and fields. Formerly it was the custom — less general now — that young men should take their academic degrees in the colleges of the United States, sometimes in those of Europe, and, returning home, hang up their diplomas as votive offerings to the god of boundaries. To-day you will find the ex-minister to a foreign court spending his final years in the solitude of his farm-house, and the representative at Washington making his retreat to the restful homestead. The banker in town bethinks him of stocks at home that know no panic; the clergyman studies St. Paul amid the native corn, and muses on the surpassing beauty of David as he rides his favorite

horse through green pastures and beside still waters. Hence, to be a farmer here implies no social inferiority, no rusticity, no boorishness. Hence, so clearly interlaced are urban and rural society that there results a homogeneousness of manners, customs, dress, entertainments, ideals, and tastes. Hence, the infiltration of the country with the best the towns contain. More, indeed, than this: rather to the country than to the towns in Kentucky must one look for the local history of the home life. There first was implanted under English and Virginian influences the antique style of country-seat; there flourished for a time those gracious manners that were the high-born endowment of the olden school; there in piquant contrast were developed side by side the democratic and aristocratic spirits, working severally toward equality and caste; there was established the State reputation for effusive private hospitalities; and there still are peculiarly cherished the fading traditions of more festive boards and kindlier hearthstones. If the feeling of the whole people could be interpreted by a single saying, it would perhaps be this: that whether in town or country — and if in the country, not remotely here or there, but in well-nigh unbroken succession from estate to estate — they have attained a notable stage in the civilization of the home. This is the common conviction, this the idol of the tribe. The idol itself may rest on the fact of provincial isolation, which is the fortress of self-love and neighborly devotion; but it suffices for the present purpose to say that it is an idol still, worshiped for the divinity it is

thought to enshrine. Hence you may assail the Kentuckian on many grounds, and he will hold his peace. You may tell him that he has no great cities, that he does not run with the currents of national progress; but never tell him that the home life of his fellows and himself is not as good as the best in the land. Domesticity is the State porcupine, presenting an angry quill to every point of attack. To write of homes in Kentucky, therefore, and particularly of rural homes, is to enter the very citadel of the popular affections.

## II. TYPES OF EARLY HOMES.

AT first they built for the tribe, working together like beavers in common cause against nature and their enemies. Home life and domestic architecture began among them with the wooden-fort community, the idea of which was no doubt derived from the frontier defenses of Virginia, and modified by the Kentuckians with a view to domestic use. This building habit culminated in the erection of some two hundred rustic castles, the sites of which in some instances are still to be identified. It was a singularly fit sort of structure, adjusting itself desperately and economically to the necessities of environment. For the time society lapsed into a state which, but for the want of lords and retainers, was feudalism of the rudest kind. There were gates for sally and swift retreat, bastions for defense, and loopholes in cabin-walls for the deadly volleys. There were hunting-parties winding forth stealthily without horn or hound, and returning laden with such antlered game as might have graced the great feudal halls. There was siege, too, and suffering, and death enough, God knows, mingled with the lowing of cattle and the clatter of looms. Some morning, even, you might have seen a slight girl trip covertly out to the little cotton-patch in one corner of the inclosure, and, blushing crimson over the snowy cotton-balls, pick the wherewithal to spin her bridal dress; for there they married also and bore children. Many a Kentucky family must trace its origin through the tribal communities pent up within a stockade, and discover that the family plate consisted then of a tin cup, and haply an iron fork.

But, as soon as might be, this compulsory village life broke eagerly asunder into private homes. The common building form was that of the log house. It is needful to distinguish this from the log house of the mountaineer, which is found throughout eastern Kentucky to-day. Encompassed by all difficulties, the pioneer yet reared himself a complete and more enduring habitation. One of these, still intact after the lapse of more than a century,

stands as a singularly interesting type of its kind, and brings us face to face with primitive architecture. "Mulberry Hill," a double house, two and a half stories high, with a central hall, was built in Jefferson County, near Louisville, in 1785, for John Clark, the father of General George Rogers Clark.

The settlers made the mistake of supposing that the country lacked building-stone, so deep under the loam and verdure lay the whole foundation rock; but soon they discovered that their better houses had only to be taken from beneath their feet. The first stone house in the State, and withal the most notable, is "Traveler's Rest," in Lincoln County, built in 1783 by Governor Metcalf, who was then a stone-mason, for Isaac Shelby, the first governor of Kentucky. To those who know the blue-grass landscape, this type of homestead is familiar enough, with its solidity of foundation, great thickness of walls, enormous, low chimneys, and little windows. The owners were the architects and builders, and with stern, necessitous industry translated their condition into their work, giving it an intensely human element. It harmonized with need, not with feeling; was built by the virtues, and not by the vanities. With no fine balance of proportion, with details few, scant, and crude, the entire effect of the architecture was not unpleasing, so honest was its poverty, so rugged and robust its purpose.

IRON AND MARBLE MANTELPiece IN THE PRESTON HOUSE, LEXINGTON.

It was the gravest of all historic commentaries written in stone. Instructive enough is the varied fate that has overtaken these old-time structures. Many have been torn down, yielding their well-chosen sites to newer, showier edifices. Others became in time the quarters of the slaves. Others still have been hidden away beneath weather-boarding,—a veneer of commonplace modernism,—as though white-washed or painted plank were a finer thing to see than rough-hewn gray stone. But one is glad to discover that in numerous instances they are the preferred homes of those who have

DRAWN BY HARRY FENN.  
DOORWAY IN THE BROWN HOUSE, FRANKFORT. (DESIGNED BY THOMAS JEFFERSON.)

a certain taste for the antique in native history, a certain pride in family associations and traditions. On all the thinned and open landscape, nothing stands out with a more pathetic air of nakedness than one of these stone houses, long since abandoned and fallen into ruin. Under the Kentucky sky houses crumble and die without seeming to grow old, without an aged toning down of colors, without the tender memorials of mosses and lichens, and of the whole race of clinging things. So, not until they are quite overthrown does nature reclaim them, or draw once more to her bosom the walls and chimneys within whose faithful bulwarks, and by whose cavernous, glowing recesses, our great-grandmothers and great-grandfathers danced and made love, married, suffered, and fell asleep.

Neither to the house of logs, therefore, nor to that of stone must we look for the earliest embodiment of positive taste in domestic architecture. This found its first, and, considering

the exigencies of the period, its most noteworthy expression in the homestead of brick. No finer specimen survives than that built in 1796, on a plan furnished by Thomas Jefferson to John Brown, who had been his law student, remained always his honored friend, and became one of the founders of the commonwealth. It is a rich landmark, this old manor-place on the bank of the Kentucky River in Frankfort. The great hall with its pillared archway is wide enough for dancing the Virginia reel. The suites of high, spacious rooms; the carefully carved woodwork of the window-casings and the doors; the tall, quaint mantel-frames; the deep fireplaces with their shining fire-dogs and fenders of brass, brought laboriously enough on pack-mules from Philadelphia; the brass locks and keys; the portraits on the walls—all these bespeak the early implantation in Kentucky of a taste for sumptuous life and entertainment. The house is like a far-descending echo of colonial Old Virginia.

More famous in its day,—for it is already beneath the sod,—and built not of wood, nor of stone, nor of brick, but in part of all, was “Chaumière,” the home of David Meade during the closing years of the last, and the early years of the present, century. The owner, a Virginian who had been much in England, brought back with him notions of the baronial style of country-seat, and in Jessamine County, some ten miles from Lexington, built him a home that lingers in the mind like some picture of the imagination. It was a villa-like place, a cluster of rustic cottages, with a great park laid out in the style of Old World landscape-gardening. There were artificial rivers spanned by arching bridges, and lakes with islands crowned by Grecian temples. There were terraces and retired alcoves, and winding ways cut through sweet, flowering thickets, withal an Eden of forest green and shadows numberless. A fortune was spent on the grounds; a retinue of servants was employed in nurturing their beauty. The dining-room, wainscoted with walnut and relieved by deep window-seats, was richer still with the family service of silver and glass; on the walls of other rooms hung family portraits by Thomas Hudson and Sir Joshua Reynolds. Two days in the week were appointed for formal receptions. There Jackson and Monroe and Taylor were entertained; there Aaron Burr was held for a time under arrest; there the refined and courtly stateliness of the old school showed itself becomingly in silver buckles and knee-breeches, lifted high the huge wassail-bowl, and rode abroad in a yellow chariot with outriders in blue cloth and silver buttons.

Near Lexington may be found a further notable example of early architecture in the Todd homestead, the oldest house in the region, built

by the brother of John Todd, who was governor of Kentucky Territory, including Illinois. It is a strong, spacious brick structure reared on a high foundation of stone, with a large, square hall and great square rooms in suites, connected by double doors. To the last century also belongs the low, irregular pile that became the Wickliffe, and later the Preston, house in Lexington—a striking example of the taste then prevalent for plain, or even commonplace, exteriors, if combined with interiors that touched the imagination with the suggestion of something stately and noble and courtly.

Take these, chosen here and there, as a few types of homes erected in the last century. The point is not that such places existed, but that

sudden, fierce flaring up of sympathy with the French Revolution; hence the deep reëchoing through the Kentucky settlement of the war-cry of Jacobin emissaries. But scarcely had the wave of primitive conquest flowed over the land, and wealth followed in its peaceful wake, before life fell apart into the extremes of social caste. The memories of former position, the influences of old domestic habitudes, were powerful still. Rudely strained, not snapped asunder, were the connective tissues of civilization; so that, before a generation passed, Kentucky society gave full proof of the continuity of its development from phases of traditional State-existence. The region of the James River, so rich in antique homesteads, began to renew itself

DRAWN BY W. L. MACLEAN.

HALL IN THE BROWN HOMESTEAD, FRANKFORT.

ENGRAVED BY GASTON FAY.

they should have been found in Kentucky at such a time. For society had begun as the purest of all democracies. Only a little while ago the people had been shut up within a stockade. Stress of peril and hardship had leveled the elements of population to more than a democracy: it had knit them together as one endangered human brotherhood. Hence the

in the region of the blue-grass. On a new and larger canvas began to be painted the picture of shaded lawns, wide portals, broad staircases, great halls, drawing-rooms, and dining-rooms, wainscoting, carved woodwork, and waxed hard-wood floors. In came a few yellow chariots, morocco-lined and drawn by four horses. In came the powder, the wigs, and the queues, the

ruffled shirts, the knee-breeches, the glittering buckles, the high-heeled slippers, and the frosty brocades. Over the Alleghanies, in slow-moving wagons, came the massive mahogany furniture, the sunny brasswork, the tall silver candlesticks, the nervous-looking, thin-legged little pianos. In came old manners and old speech and old prides: the very Past gathered together its household gods and made an exodus into the Future.

Without due regard to these essential facts the social system of the State must ever remain poorly understood. Hitherto they have been but little considered. To the popular imagination the most familiar type of early Kentuckian is that of the fighter, the hunter, the rude, heroic pioneer and his no less heroic wife; people who left all things behind them and set their faces westward, prepared to be new creatures if such they could become. But on the dim historic background are the stiff figures of another type, people who were equally bent on being old-fashioned creatures if such they could remain. Thus, during the final years of the last century and the first quarter of the present one, Kentucky life was all richly overlaid with ancestral models. Closely studied, the elements of population by the close of this period were separable into a landed gentry, a robust yeomanry, a white tenantry, and a black peasantry. It was only by degrees,—by the dying out of the fine old types of men and women, by longer absence from the old environment and closer contact with the new,—that society lost its inherited and acquired its native characteristics, or became less Virginian and more Kentuckian. Gradually, also, the white tenantry waned and the black peasantry waxed. The aristocratic spirit, in becoming more Kentuckian, unbent somewhat its pride, and the democratic, in becoming more Kentuckian, took on a pride of its own; so that when social life culminated with the first half-century, there had been produced all over the blue-grass region, by the intermingling of the two, that widely diffused and peculiar type which may be described as an aristocratic democracy, or a democratic aristocracy, according to one's choosing of a phrase. The beginnings of Kentucky life represented not simply a slow development from the rudest pioneer conditions, but also a direct and immediate implantation of the best of long-established social forms. And in no wise did the latter embody itself more persuasively and lastingly than in the building of costly homes.

### III. HOMES OF THE MIDDLE PERIOD.

WITH the opening of the present century, this taste went on developing. A specimen of early architecture in the style of the old

English mansion is to be found in "Locust Grove," a massive and enduring structure,—not in the blue-grass region, it is true, but several miles from Louisville,—built in 1800 for Colonel Croghan, brother-in-law of General George Rogers Clark; and still another remains in "Spring Hill," in Woodford County, the home of Nathaniel Hart, who had been a boy in the fort at Boonesborough. Until recently a further representative, though remodeled in later times, survived in the Thompson place at "Shawnee Springs," in Mercer County.

Consider briefly the import of such country homes as these—"Traveler's Rest," "Chaudière," "Spring Hill," and "Shawnee Springs," and the writer deprecates all odium for restricting his mention to them, or for choosing them as types rather than others.<sup>1</sup> Built remotely here and there, away from the villages or before villages were formed, in a country not yet traversed by limestone highways or even by lanes, they, and such as they, were the beacon-lights, many-windowed and kind, of Kentucky entertainment. "Traveler's Rest" was on the great line of immigration from Abingdon through Cumberland Gap. Its roof-tree was a boon of universal shelter, its very name a perpetual invitation to all the weary. Long after the country became thickly peopled, it, and such places as it, remained the rallying-points of social festivity in their several counties, or drew their guests from remoter regions. They brought in the era of hospitalities, which by and by spread through the towns and over the land. If one is ever to study this trait as it flowered to perfection in Kentucky life, then one must hope to see it, not wholly, but at its best, in the society of some fifty years ago. Then trained horses were kept in the stables, trained servants were kept in the halls. The dinners were perennial, as boundless as the courtesies; the animosities were for the time dissolved by all the amenities; guests came uninvited, unannounced; tables were regularly set for surprises. "Put a plate," said an old Kentuckian of the time with a large family connection—"always put a plate for the last one of them down to the youngest grandchild." It is narrated as a fact in a Kentucky home,—and certainly it never happened in any other,—that a visitor once arrived, as he said, for a sojourn of several days, but remained twenty years; at the end of which time it pleased Providence to terminate his visit. What a Kentuckian would have thought of being asked to come on the thirteenth of the month and to leave on the twentieth, it is difficult to imagine. The wedding-presents of brides were not only jewels and silver and gold, but a round of balls.

<sup>1</sup> Ashland, the Clay homestead, has already been written of by another in this magazine.

The people were laughed at for their too impetuous civilities. In whatever quarter of the globe they should happen to meet for the hour a pleasing stranger, they would say in parting, "And when you come to Kentucky, be certain to come to my house."

Yet it is needful to discriminate, in speaking of Kentucky hospitality. Universally gracious toward the stranger and quick to receive him for his individual worth, within the State hospitality ran in circles, and the people turned a

toerat, if revenge was desired, could always be taken at the polls. Study the history of great political contests in the State, and see whether they are not lessons in the victory and defeat of social types. Herein lies a difficulty: you touch any point of Kentucky life, and instantly about it cluster antagonisms and contradictions. The false is true; the true is false. Society was aristocratic; it was democratic: it was neither; it was both. There was intense family pride, and no family pride. The ancestral sentiment was

weak, and it was strong. To-day you will discover the increasing vogue of an *heraldica Kentuckiensis*, and to-day an absolute disregard of a distinguished past. One tells but partial truths.

Of domestic architecture in a brief and general way something has been said. The prevailing influ-

THE CROGHAN PLACE, "LOCUST GROVE."

THE CLARK HOUSE, "MULBERRY HILL."

piercing eye on one another's social positions. If in no other material aspect did they embody the history of descent so sturdily as in the building of homes, in no mental trait of home life did they reflect this more clearly than in the sense of family pride. Hardly a little town but had its classes that never mingled; scarce a rural neighborhood but insisted on the sanctity of its salt-cellar and the gloss of its mahogany. The spirit of caste was somewhat Persian in its gravity. Now the Alleghanies were its background, and the heroic beginnings of Kentucky life supplied its warrant; now it overleaped the Alleghanies, and allied itself to the memories of deeds and names in older States. But, mark you, if some professed to look down, none professed to look up. Deference to an upper class, if deference existed, was secret and resentful, not open and servile; and revenge on the aris-

ence was Virginian, but in Lexington and elsewhere may be observed evidences of French ideas in the glass-work and designs of doors and windows, in rooms grouped around a central hall with arching niches and alcoves; for models made their way from New Orleans as well as from the East. Out in the country, however, at such places as those already mentioned, a purely English taste was shown for woodland parks with deer and, what was more peculiarly Kentuckian, elk and buffalo. This taste, once so conspicuous, has never become extinct, and certainly the landscape is receptive enough to all such stately purposes. At "Spring Hill" and elsewhere, to-day, one may stroll through woods that have kept a touch of their native wildness, and lack only the restoration of timid, bounding forms to become primeval. There was the English love of lawns,

"SPRING HILL," NEAR VERSAILLES.

ENGRAVED BY H. E. SYLVESTER.

too, with a low matted green turf and wide-spreading shade-trees above,—elm and maple, locust and poplar,—the English fondness for a mansion half hidden with evergreens and creepers and shrubbery, to be approached by a leafy avenue, a secluded gateway, and a graveled drive; for highways hardly admit to the heart of rural life in Kentucky, and wayside homes, to be dusted and gazed at by every passer-by, would little accord with the spirit of the people. This feeling of family seclusion and completeness also portrayed itself very tenderly in the custom of family graveyards, which were in time to be replaced by the democratic cemetery; and no one has ever lingered around those quiet spots of aged and drooping cedars, fast-fading violets, and perennial myrtle, without being made to feel that they grew out of the better heart and fostered the finer senses.

On the whole, however, the best proof of culture among the first generations of Kentuckians is to be seen in the private collections of portraits, among which one wanders now with a sort of stricken feeling that the higher life of Kentucky in this regard never went beyond its early promise. Look into the meager history of native art, and you will discover that nearly all the best work belongs to this early time. It was possible even then that a Kentuckian could give up law and turn to painting. Almost in the wilderness Jouett created rich, luminous, startling canvases. Artists came from

older States to sojourn and to work; artists were invited or summoned from abroad. Painting was taught in Lexington in 1800. Well for Jouett, perhaps, that he lived when he did; better for Hart, perhaps, that he was not born later: they might have run for Congress. One is prone to recur time and again to this period, when the ideals of Kentucky life were still wavering or unformed, and when there was the greatest receptivity to foreign impress. Thinking of social life as it was developed, say in and around Lexington,—of artists coming and going, of the statesmen, the lecturers, the lawyers, of the dignity and the energy of character, of the intellectual dinners,—one is inclined to liken the local civilization to a truncated cone, to a thing that should have towered to a symmetric apex, but somehow has never risen very high above a sturdy base.

So we turn to speak broadly of home life after it became more typically Kentuckian, and after architecture began to reflect with greater uniformity the character of the people. And here one can find material comfort, if not esthetic delight; for it is the whole picture of human life in the blue-grass region that pleases. Ride east and west, or north and south, along highway or byway, and the picture is the same. One almost asks for relief from the monotony of a merely well-to-do existence, almost sighs for the extremes of squalor and splendor, that nowhere may be seen, and that would seem so

out of place if anywhere confronted. On, and on, and on you go, seeing only the repetition of field and meadow, wood and lawn, a winding stream, an artificial pond, a sunny vineyard, a blooming orchard, a stone wall, a hedge-row, a tobacco barn, a warehouse, a race-track, cattle under the trees, sheep on the slopes, swine in the pools, and, half hidden by evergreens and shrubbery, the homelike, unpretentious houses that crown very simply and naturally the entire picture of material prosperity. They strike you as built not for their own sakes. Few will offer anything that lays hold upon the memory, unless it be perhaps a front portico with Doric, Ionic, or Corinthian columns; for your typical Kentuckian likes to go into his house through a classic entrance, no matter what inharmonious things may be beyond; and after supper on summer evenings, nothing fills him with serener comfort than to tilt his chair back against a classic support, as he smokes a pipe and argues on the immortality of a pedigree.

On the whole, you feel that nature lies ready, or has long waited, for a more exquisite sense in domestic architecture; that the immeasurable possibilities of delightful landscape have gone

made the land so kind to beauty; for no transformation of a rude, ungenial landscape is needed. The earth does not require to be trimmed and combed and perfumed. The airy vistas and delicate slopes are ready-made, the park-like woodlands invite, the tender, clinging children of the summer, the deep, echoless repose of the whole land, all ask that art be laid on every undulation and stored in every nook. And there are days with such Arcadian colors in air and cloud and sky — days with such panoramas of calm, sweet pastoral groups and harmonies below, such rippling and flashing of waters through green underlights and golden interspaces, that the shy, coy spirit of beauty seems to be wandering half sadly abroad and shunning all the haunts of man.

But little agricultural towns are not art-centers. Of itself rural life does not develop esthetic perceptions, and the last, most difficult thing to bring into the house is this shy, elusive spirit of beauty. The Kentucky woman has perhaps been corrupted in childhood by tasteless surroundings. Her lovable mission, the creation of a multitude of small lovely objects, is undertaken feebly and blindly. She may not know

DRAWN BY W. L. MACLEAN.

THE PARK, "SPRING HILL."

unrecognized or wasted. Too often there is in form and outline no response to the spirit of the scenery, and there is dissonance of color — color which makes the first and strongest impression. The realm of taste is prevailingly the realm of the want of taste, or of its meretricious and commonplace violations. Many of the houses have a sort of featureless, cold, insipid ugliness, and interior and exterior decorations are apt to go for nothing or for something worse. You repeat that nature awaits more art, since she

how to create beauty, may not know what beauty is. The temperament of her lord, too, is practical: a man of substance and stomach, sound at heart, and with an abiding sense of his own responsibility and importance, honestly insisting on sweet butter and new-laid eggs, home-made bread and home-grown mutton, but little reveling in the delicacies of sensibility, and with no more eye for crimson poppies or blue corn-flowers in his house than amid his grain. Many a Kentucky woman would

KENTUCKY HOSPITALITY IN THE OLDEN TIME.

DRAWN BY HOWARD HELMICK.

make her home beautiful if her husband would allow it.

Amid a rural people, also, no class of citizens is more influential than the clergy, who go about as the shepherds of the right; and without doubt in Kentucky, as elsewhere, ministerial ideals have wrought their effects on taste. Perhaps it is well to state that this is said broadly, and particularly of the past. The Kentucky preachers during earlier times were a fiery, zealous, and austere set, proclaiming that this world was not a home, but a wilderness of sin, and exhorting their people to live under the awful shadow of Eternity. Beauty in every material form was a peril, the seductive garment of the devil. Well nigh all that made for esthetic culture was put down, and, like frost on venturesome flowers, sermons fell on beauty in dress, entertainment, equipage, houses, church architecture, music, the drama, the opera—everything. The meek young spirit was led to the creek or pond, and perhaps the ice was broken for her baptism. If, as she sat in the pew, any vision of her chaste loveliness reached the pulpit, back came the warning that she would some day turn into a withered hag, and must inevitably be "eaten of worms." What wonder if the sense of beauty pined or went astray, and found itself completely avenged in the building of such churches? And yet there is nothing that even religion more surely demands than the fostering of the sense of beauty within us, and through this it is that we work most wisely toward the civilization of the future.

#### IV. HOMES SINCE THE WAR.

MANY rural homes have been built since the war, but the old type of country life has vanished. On the whole, there has been a strong movement of population toward the towns, rapidly augmenting their size. Elements of showiness and freshness have been added to their once unobtrusive architecture. And, in particular, that art movement and sudden quickening of the love of beauty which swept over this country a few years since has had its influence here. But for the most part the newer homes are like the newer homes in other American cities, and the style of interior appointment and decoration has few native char-

acteristics. As a rule the people love the country life less than of yore, since an altered social system has deprived it of much leisure, and has added hardships. The Kentuckian does not regard it as part of his mission in life to feed fodder to stock, but to have it fed; and servants are hard to get, the colored ladies and gentlemen having developed a taste for urban society.

What, then, is to be the future of the blue-grass region? When population in the United States becomes much denser and the pressure is felt in every neighborhood, who will possess it? One seems to see in certain tendencies of American life the probable answer to this question. The small farmer will be bought out, and will disappear. Estates will grow fewer and larger. The whole land will pass into the hands of the rich, being too precious for the poor to own. Already here and there one notes the disposition to create vast domains by the slow swallowing up of contiguous small ones. Consider, then, in this connection the taste already shown by the rich American in certain parts of the United States to found a country place in the style of an English lord. Consider, too, that the landscape is much like the loveliest of rural England; that the trees, the grass, the sculpture of the scenery are such as make the perfect beauty of a park; that the fox, the bob-white, the thoroughbred, and the deer are indigenous. Apparently, therefore, one can foresee the yet distant time when this will become the region of splendid homes and estates that will nourish a taste for outdoor sports and offer an escape from the too-wearying cities. On the other hand, a powerful and ever-growing interest is that of the horse, racer or trotter. He brings into the State his increasing capital, his types of men. Year after year he buys farms, and lays out tracks, and builds stables, and edits journals, and turns agriculture into grazing. In time the blue-grass region may become the Yorkshire of America.

But let the future have its own. The country will become theirs who deserve it, whether they build palaces or barns. One only hopes that when the old homesteads have been torn down or have fallen into ruins, the tradition may still run that they too had their day and deserved their page of history.

AN AFTER-DINNER NAP, BY J. H. DOLPH.

ENGRAVED BY S. DAVIS.

# "CAPTAIN, MY CAPTAIN!"

BY WOLCOTT BALESTIER.

Author of "A Common Story," "Reffey," etc.

I.

ERNA was not allowed to see the papers until the tenth day. Then she read the story of his death in his own paper. Terror crept over her as she read, and she cast the "Telepheme" from her, and buried her weak head in her hands, living over the anguish of that moment. She shuddered again with the hideous crash of the collision, and went whirling in his embrace down, down into a dizzy blackness, and then lay at the bottom of the cañon, the wreck piled on top of them and round about them, the air loud with the cowing noise of escaping steam, and wild with the shrieks of the dying. His poor white face stared up at her from under the wreckage, yearning with love, horrid with pain, and his tortured lips framed the words which imposed a sacred duty on her future:

"Keep up the fight!"

Aleck had left her everything he owned, they told her, and she knew why. It was not only as his promised wife, it was as the inheritor of his work; and a week later, when she was carried down-stairs for the first time, she sent for Rignold, who, with no help but Barton's, had got out two issues of the "Telepheme" since the death of his chief, and asked him to put her name at the head of the paper. For the next week's issue Rignold set up this legend to appear above the editorial notices:

"The Rustler Telepheme."

BY

BERNA MINTERMAN DEXTER.

FOUNDED BY ALEXANDER CHESTER.

Rignold turned his rules around the concluding line, making an oblong frame of black for it. The following editorial, written by Berna from her couch, was arranged to appear below the notices:

In assuming charge of the "Telepheme," it is proper that we should say a few words. The terrible railroad accident which occurred between Cañon City and Topaz three weeks ago has cast a pall over the community, and is still fresh in all

minds. More than a hundred citizens of Rustler were on the ill-fated excursion train, bound for the celebration of Potato Day at Maverick, and above a dozen were either killed outright or seriously injured. Among the former the editor of this paper, Alexander Chester, was numbered; among the latter is included the writer of this column. This painful personal reference will, we trust, be forgiven us in view of the circumstances, as some explanation is due our readers of the reasons which induce us to continue the publication of the "Telepheme" under the old name and at the old stand. In making this explanation, we should not feel honest toward our readers in attempting to conceal a fact, no doubt already known to many of them, viz., the relation subsisting between the late and the present editor. It is due to all concerned that we should mention this, as it is because the present writer feels herself to be, in a true sense, the widow of the late editor, that she presumes to attempt the undertaking of carrying on a paper which, in his hands, has been such a power for good in this community.

This difficult post, assumed most reluctantly in response to a dying wish, we need not say is not taken up with any feeling of competence to the labors before us, nor with any feeling but that many others would fill the position more adequately and wisely. We are led to take hold of this work, where it was left off by Alexander Chester, solely out of respect for his memory, and with the belief that one who was privileged to know the hopes and plans for this town and this community which beat in that great heart may be able to carry them forward—feebly indeed, but with a sympathy and understanding impossible to any stranger. The present editor, in printing her name at the head of this column, consecrates her life to the work which fell a fortnight since from the palsied hand of Alexander Chester. All Rustler knows what that work was. The entire future of the town is bound up in it. We must have the railroad. The Three C's must come our way. Into this cause Alexander Chester poured his life-energy; to it he gave all he was, or hoped to be. As the officer on the field of battle snatches up the weapon that has fallen from his dead captain, and presses on, so we take up this work, with malice toward none, and with charity for all; but presenting a solid front to the common enemy, resolved that Topaz shall not be allowed to accrete to herself this new source of wealth and strength. It is a life-and-death struggle: we know it, and Topaz knows it. United and unanimous as we are, we have only to continue to assert our rights, and to make the advantages of Rustler duly known, to secure the Colorado and California Central without a doubt.

In conclusion, the writer wishes to thank personally all the late editor's fellow-townsmen for the generous tribute of sorrow and regret at his death manifested by one and all. She accepts it not merely as a tribute to a noble man, but to the purpose which he had most nearly at heart. The value and importance of that purpose to Rustler could not be more clearly shown than by these unsolicited tributes. They warm the heart of his successor in this editorial chair, and strengthen us for the work before us. That it may be worthy, in however humble a degree, of the man who has gone from us, and of the town of Rustler, is the hope of

BERNA MINTERMAN DEXTER.

The "copy" from which this was to be set up had reached Rignold stained with the tears it had cost the writer. He read it through with a queer feeling in his throat, then closed and locked the office,—Barton, the foreman, and the boy had gone for the night,—and, lighting the lamp over his case, set it himself. The careful, girlish manuscript, traced among the telltale blurs on little sheets of pink note-paper, impressed at the top with a twisted B. M. D. in gold, was not a sight for other eyes than his.

The sense of what was and what was not good newspaper work had rubbed off on Rignold in eight years' service as one of the compositors, and five years as the foreman, of a New York evening paper. The weekly he had come west to establish had failed; but that was because he had chosen the wrong town. Drifting back eastward by way of Colorado, he had been content to accept Chester's offer, and on another man's paper had displayed the qualities which, if the mines of his Idaho town had panned out richer, would have made his own journal successful. Chester and he had become friends, and had remained so, though it was Chester who finally won Berna; and it was not the smallest testimony to the love that dared warm to life again with the tragic death of his friend, that, denying himself the habit of thought bred by his newspaper experience, Rignold now set Berna's article without an attempt to edit it, and without so much as a preliminary mechanical motion toward the waste-basket. To know so well what his old managing editor would have done with the poor girl's editorial did not make it less pathetic. The thought caused her rather to seem more helpless and more dependent on him, and gave him reason to notify himself in plain terms that the "Telepheme" was to be made a success under its new editor, if it cost a leg. As his sensitive printer's hand, with its five eyes, wove back and forth over the case, he smiled fondly to himself at the little literary graces of her writing, as he often did at the little literary frills of her talk. They were so much part of all his knowledge and thought of her that he

could not have dissociated them from her without doing violence to the sanctuary in which he kept his love: her faults were as dear to him as her virtues—dearer, perhaps, because more accessible than the lofty qualities for which he adored her. He could not smile affectionately upon her virtues; her faults seemed warm and near.

Nevertheless, he declared to himself, as he stooped beneath the lamp that gathered its rays under the scorched green shade to throw them on Berna's pages, that he was a fool—a chartered, twice-dyed, and double-branded idiot—to allow himself to have any business dealings with a woman. Looking out through the window of the Disbrow Block, from which the "Telepheme" regarded the town whose life it recorded, he wondered how they would take it—the people of Rustler, going in and out, and to and fro, below there. The town, engaged under an electric noonday in the feverish play which, in mining-camps, is so much more active to the outward eye than the day's business, would make up its mind precious quick; Rignold only wondered which way. Would their sympathy for her situation, their liking for the grit with which she faced it, their reverence for womanhood carry her through? Would these excellent sentiments weigh against more vital considerations when it came to the scratch? Would they finally feel that they could afford them? The "Telepheme" was of course the fighting-organ through which the railroad was to be brought to Rustler, if it was to be brought at all. Would they trust the fight to a woman? Rignold sighed his heavy doubt to the dumb types in their boxes, and went on setting Berna's exotic editorial, with its singular mixture of easily-come-by newspaperese and far-brought literosity, and its still stranger mingling of shrewd reasoning and high-flown inconclusiveness.

When he had pulled the first copy of that week's paper on the old Washington hand-press which Chester had originally brought from the East with him, he sent it down to Berna, who lived alone with her mother near the end of the main street of Rustler. The house was an unclapboarded, two-story, frame structure, painted a reddish brown, not unlike the color of the rocks jutting from the mountain that hung above the roof. If you think of a giant pair of pincers standing upright and wide open, you will know how Rustler lay: Big Chief sprang into the air on one side, Ticknor's Mountain on the other; between was a narrow notch, and deep down in it cuddled the town. The greater part of the inhabitants lived on Berna's street; but the miners' cabins, built beside the shafts of a hundred mines, carried a steadily rising overflow up the flanks of

the two mountains. The house in which Berna lived was set close to the street, six feet from the board sidewalk that ran in front of her pink palings. Within this narrow space she had tried, before Aleck's death, to make a bed of pansies grow with the help of water from the irrigating-ditch that raced by the house on its way to the main ditch, supplying Topaz with its water; but the flowers had withered since the accident. As she lay on the sofa in her parlor, torn alternately by her grief for Aleck and by her own pain, she heard, after each shift at the mines, the clumping noise of miners' boots go by on their way to or from the Elegant Booze, the Honeycomb, and Uncle Dick's — establishments where one got two glasses of beer for a quarter, and a good deal of faro for a ten-dollar bill.

The injury which she had sustained in the railroad accident left her good hours, but oftener put her to the torture; and when her mother handed her her first issue she was unable to do more for the first hour than to gaze steadfastly at the heading. The sight of the familiar title made the thought of Aleck overwhelmingly poignant; tears welled into her eyes as she stared at the folded white sheet lying outside the blue Navajo blanket that covered her, and at last she turned from the sight in misery.

Nevertheless, she was helpless against the literary pleasure that tingled through her when finally she took courage to read her editorial, though she was ashamed of it. It was not for the excitement and interest of writing that she had determined to keep the "Telepheme" alive, and to shape it into a force which should carry on Aleck's work, as a son carries on the work of his father. It was as Aleck's child that she was to watch over it. She reproached herself, but finally forgave herself, with the thought that it was through his own pleasure in his work that Aleck had succeeded, and that she must find a like joy in it if she was to be in any sort worthy to follow in his steps. She did not need to stimulate a happiness in writing; she liked it; until she had become engaged to Aleck it had been her ambition to be a "magazinist." Berna was one of the half-turned-out women who begin to be common in the West. Her mind had been educated; but her intelligence, her taste, her perceptions remained to all intents as undeveloped as a Kafir's. She was charming; but if she had been as cultured as she supposed herself, it would have been impossible to associate with her. Her charm lay in her simple-mindedness, in her unselfishness and kindness and devotedness and pluck; but what she really liked in herself was her complicatedness. Some of this she had endeavored to explain through the Iowa magazine which printed her earliest contributions to

the press, just after she had "been graduated," as she called it, from Miss Drewett's New England seminary. The contributors to this magazine were almost all women, and were, without exception, complicated.

Her mother came in as she laid down the paper to ask if she would see Ben. Berna drew her shawl about her and nodded, brightening with pleasure. The room in which she lay was stiffly furnished in a stamped red plush, but a comfortable old sofa, covered with chintz, had been moved in for her out of the dining-room. On the walls were two cheap paintings of the Yosemite, Berna's graduating diploma under glass, and a photograph (framed in a deep black-walnut molding) of her father in the uniform of a lieutenant of volunteers — the artist had picked out the epaulets in gold and touched the cheeks with carmine.

Mrs. Dexter asked if she did n't think it would fret her to see Ben.

"You know the doctor said —"

"Yes; I know, mother. But if I'am to carry on this work I must n't mind the doctor. Perhaps it will kill me; but if it does, it must. I shall only give in my report to Aleck a little sooner."

The tears, against which she had not yet learned to school herself, once more stood in her eyes.

"Gracious, child! I don't believe Aleck ever in this world expected you to go on with the 'Telepheme.' How could he think a woman could do such a thing?"

"I don't know, mother. But he trusted me to do it, and I can't be false to him."

"Well, you 'll kill yourself," she said weakly. "Why can't you let Ben do it? He 's willing and able."

"How can you suggest such a thing, mother? You know he 's a stranger in the town."

"I don't care if he is. He knows printing."

"Of course. But he can't *feel* as we Rustlerites do. You know that. The railroad is nothing to him."

"No; I suppose not," she owned, downcast. But in a moment she added, with more spirit, "There 's lots of folks in the town that it 's plenty to, though. Some of 'em would be glad to edit the paper if you 'd let 'em."

"They would n't know how."

"Well, do you know how?"

"No," answered Berna, shaking her hair loose from her face, raising her head, and drawing in a deep inspiration; "*but I've heard Aleck talk!*"

"Oh, dear!" exclaimed Mrs. Dexter, rising with the feebleness of rheumatic limbs, wearied with a life's hard work, "I suppose we've got to bear it. But I do hope you 'll be careful of yourself and not overdo. I wish I was n't so

afraid you 'd lose the little money your father left us in the 'Sons of Honor,'" she added pathetically.

"But I sha'n't, mother. I 've explained that so often. I shall only use Aleck's money. He left me enough to keep up the paper with. When I 've sold the 'Lady Berna' mine I shall have plenty."

"I know you say that, Berna, and you think you mean it. But when once you get started you can't tell what you 'll do. Look at Aleck! I 'm sure he would have pawned the coat off his back any minute for the sake of his paper; and I don't believe you 'll do any less for *his* sake when the time comes."

"Yes, mother," said Berna, soothingly, laying a hand in her mother's work-roughened palm. "Show Ben in, won't you, please?"

Rignold appeared at the door in a moment, halting on the threshold with his slouch-hat in his hand.

"Come in, Ben!" Her voice was still feeble. Mrs. Dexter pushed him gently in from behind. "I 'm so glad to see you," Berna continued, putting forth her wasted hand from under the shawl. "Be seated, won't you?"

But Rignold did not immediately seat himself. He stood looking down into her face with a tender studiousness. The high color, which in health shone brilliantly against the creamy pallor and childlike smoothness of skin that often goes with auburn hair and blue eyes, had gone in her illness; her usual roundness of figure and plumpness of cheek were gone also. What remained was the bright vitality of her deep blue eyes, and the extraordinary beauty of her abundant hair, which she was wearing coiled in thick, burnished masses of reddish brown or brownish red, as one chose, or as the light served.

The man standing above her was tall and spare, with a fine figure, a little stoop-shouldered from bending at the case. He carried his large, round head well back; his dark hair curled a little in receding from a high, clear brow; his brown eyes encountered the observer with a singularly honest, straightforward look. He shook hands as if he meant it.

"I did n't feel as if I ought to come, but I did n't see my way to not coming," he said.

"I see I must tell you one thing right away, Ben. You 're not to think of me as a woman." A distressed, whimsical smile appeared on his face, which she answered with: "I mean, I 'm an editor like anybody else. There are plenty wiser and more adequate, as I said in my editorial. I shall be incompetent in a good many ways at first, and I 'm sure to do foolish things. But there are men in the profession who began with less knowledge than I have now, and who have succeeded; and there are others who be-

gan with more knowledge, and have failed. I ask no favors that were not accorded to them. I only wish to be judged fundamentally on the same basis."

"I don't feel any call to judge you, Berna," answered Rignold, with a smile, as he took a chair; "but if I did, I don't see but I 'd have to judge you as a woman. It 's all right to say, think of you as a man. But, you ain't a man, and that 's just what I like about you, and what makes me want to help you, if I can. You are a woman, but you 've got a man's sand."

"Don't say that, Ben. I have n't got Aleck's."

"See here! Do you think Aleck, or any other man, for the matter of that, would have taken up a job like this two weeks after he 'd lost the only thing that made life worth while to him, and taken it up without turning a hair and without ruffling a feather to call attention to it? If you do, you size men up for a better breed than they are."

A groan burst from her, and she covered her face quickly with her hands.

"I 'm a fool to talk like that!" he cried.

"No, no! It does me good. You understand. Every one won't, perhaps. They won't think it decent—the ladies particularly. They will say I don't mourn truly for Aleck; as if this were n't the best and only mourning for him! As if it were n't just because I care so much that I can't justify myself in wasting *his* time in tears! That 's the way I feel, Ben—that husband and wife have a double time in this world; and because both times belong to them and to God while they both live, it 's the happiness and the sacred responsibility of the survivor to answer for both times when one time is—is frustrated."

Rignold, resolved as he was to keep his wish to help her disinterested and separate from his love for her, could not help wincing at this, while he smiled at her words. He saw, as if looking into the future through a rift in the curtain, how they would be constantly running up against this spectral third presence in their intercourse, and how he should be "stumped" by it, perhaps for always. It was a presence that he had loved in life, but the presence of the man she had preferred to him while it was still open to her to choose, and the presence of the man who he must believe was to be permanently dear to her. He wanted to cry out against this folly of devotion; he wanted to say how crazy it seemed to him—this duty to the dead, this conscience about a ghost. Perhaps he might have said it if he had n't guessed in time that what he took for moral indignation was probably a good deal more like simple jealousy. With his accustomed squareness, he said to himself that if he had gone the way of Aleck

he should have hungered for just such devotion in his place. Perhaps it would n't last forever, and if it did, it was still good to look forward to the prospect of working by her side, helping her where he could.

He spoke the sympathetic words that came to him in answer to her declaration; and then he said, "I suppose you've figured out how you're going to work this thing—lying down?"

II.

BERNA'S first issue was published on the following morning, and by afternoon fifteen new subscribers had handed in their names at the office of the "Telepheme." One or two enthusiasts even paid up long-overdue subscriptions, and ordered the paper sent them for the following year; and Mrs. Dexter was kept busy informing the ladies who called on Berna that as yet she could see nobody. The town was in a state of emotional sympathy which it would gladly have expended in taking the horses from Berna's carriage and dragging it through the streets, if the plucky young editor had owned the carriage or the horses.

Rustler still trembled with the memory of the accident; it had scarcely buried its dead, and the desolation of the bereaved families echoed in its one mountain street. With the inhabitants Chester had enjoyed the repute of a vigorous personality, offering its strength unreckoningly to the town's ambition; and Berna, who hitherto had been less popular in the town on her own account, had, before the publication of her first issue, gained, through the circumstances surrounding her lover's death in her presence on the day before their wedding-day, an honor beyond anything that Chester had known. It was only necessary that she should rise from her bed of pain, and, in the midst of her grief, take up Aleck's work, to constitute her a heroine. Rignold had been sure that they would like her "sand," but he had not reckoned sufficiently, he found, with their pleasure in piecing a romance out of any event which concerns a woman publicly. Her devotion to Aleck's memory, which to the women of the place seemed (against Berna's expectation) "just splendid," won the profane praise of the men at the Elegant Booze and on the street-corners, not merely as showing the right stuff, but as showing it on behalf of the town. They rolled her name relishingly on their tongues in their perception of this final rightness; like the Greeks, it warmed their loyal pride to know that even their women were patriotic. They saw Berna looking well in a newspaper article on Rustler; and this created her part of the town's "material," part of its capital for booming purposes.

Berna was made very happy by her success, and slept that night the sleep of those widowed queens who have had to doubt for the first tremulous hour of sovereignty the allegiance of subjects that mourn a king. Aleck's path lay freely before her; she had only to tread it worthily. The town where she had first known Aleck, and where they had made a grave for him, the town which he had loved and served, the town for which he had been ready to shed his blood and for which she was now so willing to shed hers, the town that he had left to her care—the town had accepted her. But in the morning she put aside merely agreeable thoughts, and day-dreams of what she would yet do for Rustler, and settled down soberly to her work. It was very well for every one to wish her luck, but Berna had a hard-headed little theory that she must make her own luck, and she went about the preparation of a rousing railroad editorial in Aleck's old manner.

The system on which the paper was to be conducted had been fixed upon between her and Rignold at their conference. Its policy was, of course, to be guided wholly by her; she was to take complete charge; all the leading editorials were to be hers, and she was to supervise the news columns. Rignold was to look after the "locals," write the minor editorials, find advertisements, superintend the job-printing, and manage the business department, and in general represent her to Rustler. Berna had certainly cut out a large undertaking for herself; but in her ignorance she had let Rignold load upon his willing shoulders a heroic proportion of the work. He could not tell her how glad he would be to double his stint for her sake, but he could go forth to scour the town for emotional advertising; and (not to let Berna's boom pass without immediate practical result) he did this on the morning her first number was published. Sensible of the vicissitudes to which such enthusiasms as Rustler's for Berna are liable, he declined to accept any advertisement, under present conditions, for a shorter period than one year: if they wanted a newspaper they must expect to pay for it, he said; and if they really believed in the town, and had the courage of their convictions, they would probably pay for it in advance. His theory did not meet with universal acceptance, but it met with nearly six columns' worth of acceptance, and this, as he explained in the next issue under the heading of "Our Boom," struck him as handsome. He let slip, in the course of this brief editorial, enough restrained self-gratulation on behalf of the "Telepheme," and enough general good feeling and modest sense that Topaz would never have toed the mark so squarely in a similar emergency, to have filled one side of the paper, di-

luted as an inferior man would have diluted it. Rignold wrote carefully, with the feeling constantly upon him that he was working for larger issues than the success of Rustler or the "Telepheme." He found Berna in the point of his pencil when he would muse on his next sentence, and the white paper was covered with her name before he wrote a line upon it.

He had not needed to inquire his fate in the time before Berna's engagement to Aleck; and he withheld himself now with a sensitive scrupulousness from even the semblance of love-making. He felt in the weeks that followed that he must not allow himself to think directly of her yet; but the habit of thinking of her indirectly lapsed at times into the most straightway regard of her. At these seasons, however, her own attitude corrected his unconsciously; for the profound preoccupation of her whole being with Aleck's memory must have baffled the warmest lover. Rignold's love for her, in fact, made him feel almost foolish in her presence, as if he were trying to catch the attention of an oblivious animal or child. Her detachment from the ordinary affairs of the world sometimes frightened him; she was eating her heart out for her lost lover, and the only sign of it that she allowed any one to see was her joy in events which would have given him joy. It was, of course, chiefly in connection with the "Telepheme" that Rignold witnessed the daily expressions of her simple faithfulness to his dead friend; and it was in work for the "Telepheme"—that is, in work for her—that he tried to forget her devotion to the spirit of another man, or tried to wish that she might never lose it. He could like it, as he liked everything about her, though it made him miserable and impatient.

It was perhaps his good fortune, though Berna made it difficult for him to manage himself, that this soon became, on the whole, rather simpler than to manage her paper. His young editor's word was "development," and it was pathetic to him to see how she pursued this idea of Aleck's, as she did other ideas derived from the same source, without the strength or the balancing sense and shrewdness which had enabled Aleck to give such words actuality. She became, as the months went by, and as she gained a measure of wisdom from her mistakes and successes, by no means a hopelessly bad newspaper man, as she liked to call herself. She had enterprise and assiduity, and the wish to print the news; and her still stronger wish to make her "diction elegant" she did not allow to interfere seriously with these good qualities. Her real trouble, from a financial point of view, was that she wished to print more news than the paper could afford, or than Rustler could pay for. Having imbibed from Aleck

his belief that the best was none too good for Rustler, she endeavored to give the "Telepheme" the catholic tone of the weekly edition of a New York daily. Refusing Rignold's earnest suggestion that they rely upon a patent outside, or at worst upon plate-matter, for the better part of their miscellany, she spent the long hours on her sofa, scissors in hand, culling interesting items of news, and what she had learned from Rignold to call "good stories," from her exchanges—guided in her selection, it is to be feared, by the taste of Miss Drewett's rather than by a vision of what Rustler would probably like to read. Scandals, hangings, prize-fights, murders, and all other items of a too vivid interest she excluded; and the "Telepheme" became that ensample of purity and social health for which we all pretend we are longing. One whose reading was confined to Berna's paper might conveniently have imagined himself resident in a good and harmless world, in which was no evil save that engendered by Topaz. She tried to atone for this, which Rignold taught her to regard, from the counting-house standpoint, as the deadly sin, by engaging a weekly telegraphic letter from Denver. It was sent on the morning the paper went to press, and contained all the latest news.

About this they had many discussions, wherein she met Rignold's objections with arguments in which Aleck's slangy wisdom often mingled curiously with her graduating essay view of life, and her knotted pink-ribbon manner of expression. His suggestion that the Denver letter constituted an expense not justifiable by a circulation three times their own, and, as it did not bring them a subscriber, that it involved a loss rather larger than the other loss it was designed to set right, she met with something like impatience.

"Do you mean to advise me," she asked, "to do the little thing rather than the great one? Do you really wish me to run a paper on anything but large ideas? Do you expect me to give our readers only what they already want and have learned to expect? The man who attempts to be merely up to the day in the West is going to get left; he must be up to to-morrow!"

As the town looked on at these developments in the "Telepheme" its first sentiment of enthusiasm began to take a very faint chill of bewilderment. The catholic tone by which Berna set such store was indifferent to its citizens, and they could have got along with less diction if they could have been furnished with more sensation. They fortunately continued, however, to admire and rejoice in her railroad editorials. Heaven knows how she wrote them! Her own theory was that she did not; she rever-

erently ascribed their authorship to the inspiration of Aleck. It was true, at all events, that he never seemed so near to her as when she was penning them; and if for no other reason than this, the conduct of the "Telepheme" would have given her great happiness. Her glib denunciations of Topaz, her ready magnifications of Rustler, her solid reasoning about the advantages which the Three C's would enjoy if it should finally come where the "Telepheme" was edited, had a man's cogency and fire; the thin substance of her cleverness seemed penetrated as she wrote on the theme of the railroad by a kind of trance horse-sense. On the streets of Rustler these editorials were sometimes called "corkers" and sometimes "howlers"; but this did not represent a divided mind. They were, in a way, more effective than any similar work by a man would have been, for no man could have been so impudent or so ferocious. The seal of their success was at length set upon them when the other papers of the State began copying them. Berna of course copied back their praise into the "Telepheme," and the town simply licked its chops. To have given the quarrel between Rustler and Topaz the dignity of a State fight, at which the whole population of Colorado might be fancied to be looking on, was a service for which it was felt Berna deserved well (if everybody could know the real merits of the case, no one could doubt which way the railroad would go); and she began at once to retrieve some of her lost popularity.

When, therefore, beginning at the end of a few months to sit up a little every day, though still not strong enough to go out, she broached the plan of reorganizing her old "Culture Club," she met with such a response from the ladies as she had not dared expect.

The club had gained but a mild success before the illness of its founder, for the subjects were felt by the ladies to be rather stiff; but even the new members now took kindly to the young editor's proposal of papers on "The Heroines of George Eliot," and "England's Early Mythic History," and to a suggested conversation, to be led by Berna, on "The Relation of Men and Women in Homer." Perhaps, however, Berna's announcement of a kind of learned game to be played at their meetings in off-weeks, in the evenings, when the men came late for oysters, proved more distinctly popular. Rignold, observing these things, and looking on the success of the club as a sign, began to hope that, in spite of a mad system of expenditure, the paper might pull through without borrowing capital beyond the two thousand dollars obtained from the sale of the "Lady Berna."

These were happy days of prosperity and

power and influence for Berna; the circulation of the "Telepheme" increased, and the town itself began to grow again after a long season of depression. Berna allowed herself to ascribe both growths in part to her own exertions, and looked on the newcomers (for Aleck) with a double air of proprietorship, as "Telepheme" population and as "Telepheme" subscribers. She instituted a quiet monthly census of her own, publishing the results when favorable, and this became one of the most popular features of the paper in Rustler, being the better liked when it began to excite the uneasy derision of Topaz. The truth was that the mines of Ticknor's Mountain and Big Chief, always fairly well-to-do, were now making large shipments of high-grade ore, and as the "Telepheme" never concealed anything of this sort, a certain tendency of the floating population of surrounding towns toward Rustler began to be observable.

Rignold, though he could not share his editor's confidence in the continuance of these good times for the town and the paper, made them as good for himself as he knew how by seeing a great deal of Berna. He helped and served her about the paper with untiring energy and simple patience, and she recognized his goodness with gratitude; but he knew that she conceived of it all as done for Aleck, in the same way that she did it all for Aleck, and he knew that she was grateful on Aleck's behalf. The situation offered so little satisfaction to him that he found it hard to be sorry in the first moments when the change came. But, in fact, he was sorry, and if not for the change, then for her.

The current which had turned in her favor gave signs for a month of turning the other way before it finally did turn; but when the change came it fell upon her with the suddenness of a thing unexpected and unimagined. Her first word of it reached her one evening as she sat by her lamp thinking out the editorial for the next week's issue, while she rocked to and fro in her spacious rocker, walled in by her mother with pillows, and ran through her State exchanges.

It is rumored that Rustler is to have a new paper. They are getting tired, it seems, of having the town represented by a woman.

Her eye fell upon this item in one of the papers which two months before had copied extracts from her railroad editorials with approval.

Rignold, looking in a quarter of an hour later for his customary weekly chat with her about the contents of the next issue, found her still staring dumbly at the newspaper. She

looked up at him with blind eyes. Then in a moment she asked:

"Did you know about this?"

"What?" pretended Rignold.

She tapped the paper decisively with her forefinger, without speaking, while she gazed at him in silence.

"Yes."

"Why did n't you tell me?"

"I did n't see what good it could do."

"You would have told Aleck?"

"That 's so."

"Then why not me?"

"Why, it 's altogether different, Berna."

"Different? Sit down. How different?"

"Every way. I did n't want to hurt your feelings."

"You mean I was a woman. That 's true. But I have n't any less at stake on that account. I 've more—twice as much. You forget Aleck."

"I 'm not likely to do that," retorted Rignold, stung.

"What do you mean?"

"Good heaven, Berna! Don't take it like this!"

"You mean I should remind you of him if you forget. I suppose you 're right. I should. I do talk of Aleck. I 'm editing his paper; I 'm trying humbly to live out his life for him. How can I help it? I can't forget him if the town does."

"Pshaw, Berna! The town ain't forgetting him. But it has to think of itself, or it thinks it has."

"And so they try to kill his paper?"

Rignold dropped his eyes. "I suppose they don't think it 's his paper."

Berna started in her seat. "Have I put myself forward too much? Have I made too much of myself and too little of him? Yes; I was afraid of that."

"No, no! Lord knows you 've made enough of Aleck. You 've put him first everywhere. The town just don't want a woman for an editor. There 's the whole of it, Berna, without trimmings. I know it 's hard on you—awful hard, after all you 've done and spent and suffered to give 'em a good paper, and to keep up Aleck's name, and boom the town and bring the railroad. But towns ain't grateful; you know that as well as I do; and I don't suppose Rustler 's any exception. Look here, this is the way it is. They want the Three C's, don't they? Well, they think they stand a better show to get it if they have another sort of paper, and have a man to edit it. They think it 'll look better outside. I suppose it will. But they won't get a paper the equal of the "Telepheme" in a hurry—not if they put two men on to edit it."

"Oh, what do I care how much better or worse it is? They won't let me do Aleck's work."

"They can't stop it."

"They don't want it. It 's the same thing. I 've offered the town my life, I 've offered them all my love and all my service, and they"—her lip trembled—"they don't want it. It 's not for myself I 'm hurt; it 's the rejection of Aleck through me. They don't want *him* either. He 's done all he could for them, and they 're done with him. He brought them to a place where they could get along without him; and now I 've brought them a little farther, and they can do without me. O Ben!"

She gave a little gasp and gulp, and suddenly buried her face.

Rignold leaned forward from his chair and laid a hand on hers. "Drop it, Berna! Give it up, and let them go their own ungrateful way. You 're wasting your life on them, and what could they ever give you in return, if they did their best?"

"Give me? Do you suppose I want anything?" She looked up fiercely through her tears. "I 've got to get my living and ma's out of the paper, and that I 'll take, for the laborer is worthy of his hire. But that 's all. Aleck worked for the love of it; he fought for the town the same way a soldier fights for the flag. He was n't thinking of rewards. 'It ain't boodle I 'm after,' he always used to say, and it was true. And after that, do you think I could—could"—she caught her breath and stifled a sob, as her rhetoric returned to her with her self-command—"could palter with the question of recompense? I don't want to be paid, Ben. I want to be let do it."

"Well, no one can prevent you. It 's a free country. You can go on publishing the 'Telepheme' just the same, if they do issue another paper alongside of it. Plenty of towns have two papers that can't rightly support one."

"I know it, Ben, I know it—foolish towns, wicked towns—towns that have no respect for themselves or their cause! They divide their forces in the face of the enemy, and fight each other when they ought to be fighting the common foe. That shall never be said of Rustler. It was the *town* that Aleck loved; it was n't his paper, and it was n't himself. And I should be unworthy of him if I could n't be glad to bury my pride in the paper, and all the ties that bind me to it through Aleck, and kill the 'Telepheme' to-morrow, if it can help the town. If I can serve Rustler better by lying down and letting it trample on me, than by standing up and fighting for her, that 's my place. I only want to be safe."

"Don't you be sure of it, Berna! Don't you think it! It ain't true. But, all the same, I 'd

give it up. The town *can't* support two papers, that's a fact; and if it don't, and if it 's the 'Telepheme' that goes to the wall, you will have spent all the money that Aleck left, and perhaps your mother's insurance money too, before you're done, and have nothing left to live on. I don't want to see you come to that, Berna; and if you're willing for yourself, you won't be for your mother, if you think a minute."

"Stop! stop! I'm not going to spend ma's money. When I've spent Aleck's I'll give it up. But what you say puts my duty before me. I *must* spend Aleck's! I must n't, I dare n't, take the town's word for it that they're tired of Aleck and of me, until I've spent all that 's left in giving them a chance to take that back—for Aleck's sake!" she added devoutly. "They've changed once; they may change again. Who knows? What was it that made them change this time, Ben?" she inquired, as if coming to the question of Rustler's altered temper for the first time.

"Oh, silliness! You don't want to know."

"Ben," she cried, incriminatingly, "stop sparing me! Tell me."

"Topaz kept joking them on their lady editor. You must have seen the 'Telegram.'"

"Of course. But what then?"

"Why, the other papers took it up. A weekly paper 's got to have copy. You know that, Berna."

"Certainly; I've seen all that, as it came along in the State exchanges from week to week. But I never thought the town would be cowardly enough to mind it. Oh, shame on them!"

"No; that ain't fair, Berna. It seems foolish; but it was n't for themselves, really. You can see that, if you stop and think. They were afraid of its effect on the railroad. A town that wants a railroad can't afford to be made fun of by the press of the whole State. A railroad 's a serious business; you've got to be worthy of it all round."

"Of course. But my railroad editorials are n't a bit poorer than when the whole press of the State quoted and praised them, and Rustler went wild with delight over them. Nothing has changed." She paused thoughtfully. "But I don't want Rustler to be made fun of, not on my account, nor anybody's. It *will* hurt the town! I must stop that. But they might have trusted me to! Why did n't they come to me squarely and tell me that I was injuring the place? They might have believed that there are some things I care more for than myself; they might have known I'd have remedied the trouble, or stepped down and out. Do you mean to say, Ben, that they have the courage to give this as their reason? Why, they'll hurt the town more that way than any way. They'll

be the laughing-stock of every paper in Colorado, from that one-page little rag they're getting out in the new camp on Eagle River—what's its name?—Flux, to the 'Rocky Mountain News.'"

"No," said Ben, dropping his gaze upon the soft hat he twirled round and round in his fingers; "they don't *say* that 's their reason."

"What do they say?"

"If you'll excuse me, Berna, I guess I won't go into that."

"But I can't excuse you."

"Oh, well," began Rignold, desperately, and stopped.

"Why, what 's the matter, Ben?" she asked in bewilderment, watching the uneasy flush mount to his forehead. "Is it something personal? Is it something disgraceful?"

"Good heavens, no! It ain't disgraceful. But it ain't a thing for me to tell you, unless I tell you something else at the same time."

"Tell me both things."

Ben shook his head. "You would n't like it."

"Try me!" said Berna, persuasively.

The breath was coming fast in Rignold's throat. He made two beginnings, and paused helplessly. "It would n't do any good," he said at last.

"Why, Ben, I never saw you behave like this. What 's the matter?"

"Oh, love 's the matter, Berna—love for you, that 's killing me. You don't want it. You've got no more use for it than Rustler has for the 'Telepheme.' I tell you because you ask me; but I know well enough there ain't room for another paper in *your* town. I know the field belongs to Aleck. It 's right; I ain't got nothing to say against it." He lowered his eyes again.

"Ben!" gasped Berna. Then in a moment she added another name.

"Of course, of course. I know it, I tell you. I was a fool to say anything. But you would have it. The town says it ain't right that we should be so much together, and work the paper alongside each other, and not be married. They don't think I'm in love with you. They never guess that. And they know what you feel about Aleck, anyway. All they say is, it ain't proper. I could n't tell you the one, you see, without telling you the other. I've told you both now, and I guess I might as well go."

He rose to his feet, but Berna stopped him. "Wait, Ben!" She laid on his coat-sleeve the hand which would have detained him at the gate of heaven. "Good Ben! Sit down again—won't you?—and we'll talk of this. It 's awful—coming so suddenly. Give me a moment." He dropped back into his seat with reluctance.

She locked her hands distressfully in her lap.

"But I don't see how we're going to talk of it! O Aleck!"

"Sure! It ain't treating him right even to discuss it. I was his friend, and you were the same as his wife. I know that's the way you feel; and partly that's the way I feel myself. And so it ain't decent—what I tell you—but it's the truth. I love you, Berna, and I have loved you ever since long before Aleck and you were engaged. I held my tongue then, and I gave you up to him in my own mind, and if he'd lived you'd never have known what your marriage cost one man. But he did n't live. I wish he had. I can say that truly. I never wished his death; and when he was brought home to us here, that awful day, I took a hurt I have n't got over yet. But he is dead, Berna; and I'm alive, and if I'm to go on living I can no more do it without loving you than I could go on living with my heart wanting in my side."

"O Ben, I'm very sorry. You've been so good to me—so good! I've always thought it was for Aleck. But if it was for me, and you were saying no to this feeling all the time, and keeping it back for his sake, then I honor you for it, and—and I thank you. But what are we going to do, Ben?"

Rignold could not keep back a smile at this question of a child. "O girlie, if you leave it to me—"

She gave him a long, absent look. "Yes; I know," she said at last. "Of course I can't leave it to you—in that sense. But you must help me to arrange, to plan to—do the other. I've no one else to turn to; I have n't had any one since—" She blushed. "You must help me against yourself."

"All right," returned Rignold, with dreary readiness, from some outer place. He had been wishing himself far away somewhere in space, like Aleck. He would exist for her if he could die, perhaps. But he added, "We'll keep up the fight."

She contemplated him for a moment, reflectively. "No," she said; "I will, but you must not. The town is right, perhaps; but whether it's right or wrong, we could n't go on together if they think—that. No; I will go on alone, and we will see what happens. I won't believe that every one has deserted me all at once. I won't believe that towns, as you say, have no gratitude and no memories. Why, memory is the life of a town: how can it look forward to a good future if it forgets its good past? I'll fight it, and I'll fight it on that line, Ben. I'll *make* them remember! They shall learn that if they're going to forget Alexander Chester they've got to do it publicly and shamefully and to my face."

"You *have* got sand!"

"I've got the sand to be true, and if I've got to be true that way—why, I must, that's all. There's no one else."

"Why, Berna!" he exclaimed in pain.

"O Ben! Forgive me. There *is* you, and I know how gladly you'd do it. But don't you see how you're cut off from trying, and how every one is cut off but me? Besides, I'm the one who can do it; it's for him, and that gives me the wisdom and the strength; and it's for him, and I know how he would want it done. But Ben—" Her face lighted up.

"Yes?"

"Listen! This is what you can do for me. I've got an idea. Who has been selected to edit the other paper?"

"Why—"

"I see. They *have* asked you. That makes it so much the simpler." She leaned forward and touched his arm again. "Edit it, Ben! Edit it!"

"Look here, Berna, what do you take me for? You won't let me be all the friend I'd like to be to you; but I'm not going to make myself your enemy."

"You're going to be twice my friend. Don't you see? If I must have an opponent, I like you best."

"But I should have to fight you, Berna."

"Of course. But you'd fight fair. The other man might not."

He regarded her for a moment, stupefied, while many thoughts raced through his head. "All right," he said at last. "All right. You're giving me a hard row to hoe, and yourself a still harder. Goodness knows how you'll get out the paper from a rocking-chair, with nobody to help you. But I suppose you'll manage somehow. You've got the pluck for *anything*."

"Good! Then that's settled. Now tell me, who is fomenting this trouble?"

Berna would still have liked a good, round, sham-literary word on her way to the stake, and Rignold's directness would still have been puzzled and amused by it. He half smiled now as he told her that McDermott of the Chicago Clothing House, B. G. Franks, the shoe man, Martin of the European Hotel, Beck Kruger, the grocer (who she would remember was always taking a column in the "Telepheme" to announce the arrival of a fresh consignment of Grand Junction peaches), and Dibble, the lately appointed postmaster, were at the head of the movement for a new paper.

"What!" she exclaimed, "Mr. Dibble one of the recreants—the man who took my father's place, the man for whose appointment we worked so hard on the 'Telepheme,' Ben? You're mistaken." He shook his head. "But they have all pretended they were my friends.

Don't you remember how enthusiastic Martin was at first? And McDermott? They took half a column apiece, though neither of them needed it, and promised to stand by the paper through thick and thin. They thought I could be useful to them then, I suppose; and now they think some one else will be. That's all. No matter, Ben." She gave him her hand. "You be the same one else. I'll promise not to hate you. But I'll fight you tooth and nail, until—until I know. The day I can make myself sure, the day I feel I can face Aleck without shame, and say, 'The town does n't want us,' and know I say truth—that day I give the paper up. The day I know that the 'Telepheme' can't help the town I shall know it will hinder it, and I will never publish another issue. Till then, it's war!"

She smiled a pallid smile from among her pillows, as she shook hands again, and he saw that she had overstrained herself.

"Good night."

"Good night, Berna. Good night. We sha'n't meet any more for talks about the paper. I suppose we sha'n't meet at all except in editorials, where we'll give each other down the banks. I'm sorry. The worst, though, is being afraid for you. For God's sake, take care of yourself!"

Berna looked up at him shrewdly. "You think I'll be careless about my health, and overtax my strength, with no monitor by to keep me straight. Well, then, I promise you I'll be careful. That shall be my thanks for all the care you've taken of me, Ben. I can't afford to be ungrateful," she added wistfully; "I have n't friends enough. Good night—dear, kind Ben!"

III.

HE got himself out; and the next morning he went to the committee whose advances he had declined, and told them that, if they were still of the same mind, he would undertake the editorship of the paper and furnish the capital. That afternoon he telegraphed East for the balance of his savings, amounting to \$1200, all that he had remaining in the world; and when the money arrived he bought the necessary materials,—type, press, paper, and office furniture,—opened his office in the Bloxham Block, opposite the office of the "Telepheme," and published the first issue of the "Apex." The name, which was chosen as a tribute to the fact that Rustler lay under the shadow of the Continental Divide, was suggested by Dibble, the postmaster, who saw a kind of dual symbolism in it.

"'Apex' means on top, don't it?" said Dibble. "Well, then! And ain't Rustler on top

—on top of the backbone of the continent, on top of her rivals, on top when it comes to railroads, on the tiptop when it comes to newspapers? That's right—'Apex' it is."

Rignold did n't care what they called it; it was his paper, but it was *her* experiment. His care was for the paper itself; and he took immense pains with the first issue.

"Oh, well," explained Dibble, "who ever heard of a first issue being much? The machinery don't work, the type's all fresh, the staff has n't settled to work, the whole thing's loose. That's been true of every paper from the beginning of the world. It'll shake down. It'll shake down. Trust Rignold for that. He's the stuff. Why, it's worth two of that measly female sheet across the road, now. We'll get a railroad with this paper, and we'll get some sense about politics. No woman business!"

But the first number of the "Apex" was really not so much better than the "Telepheme" that Berna published the same day. Being set in larger type, it contained less news; the miscellany was made up from "plate matter," as Rignold had always urged that the "Telepheme's" should be, and there was no such extravagance as Berna's telegraphic letter from Denver. There was more advertising in the "Apex" than in the "Telepheme," because the business men, having decided on a new paper, threw all their advertising into Rignold's hands; and though Berna ordered all the "dead" patent-medicine cuts in the office, and all the old land-office notices that remained standing, to be inserted as fresh advertising, her advertisement column still looked rather hollow. But this gave her so much the more room for news (which she had now learned to make of the Rustler standard) and for miscellany, in the matter of which her judicious habit of selection went far. On the whole, as the town would have said if it had not been trying hard to say the other thing, the "Telepheme" was "the better nickel's worth."

Her editorial was an embodiment of what she had said to Rignold, expressed with dignity and with just sufficient feeling. It was extremely direct and uncompromising, though tactful, and if the organizers of the new paper did not wince that evening upon their hearthstones, it was because they had determined not to in advance. That which really troubled them was the perception, forced upon them with the second issue of the "Apex," that the "Telepheme" was not yet stamped out, nor very obviously in a way to be. They had taken Berna's editorial for her swan-song, believing that, in depriving her of the assistance of Rignold, they had adopted the surest mode of stopping a paper which had become an injury to the good standing of the town. But Berna

went on, with depleted advertising columns, but with ever-fattening news columns, and with a resolved and untroubled air which invited victory, if it did not predict it. At Rignold's suggestion she had found a substitute for Barton, who, released from his mechanical duties, gathered local news for her and looked after the advertising. Barton could not actually replace Rignold, but, in common with many Western men, he balanced an incapacity to do anything very well by an inability to do anything very badly; and he soon discovered that faculty for thinning out one local item into four, and imagining one out of nothing, which is the bulwark of the rural press. With his help Berna got out a very creditable paper. Removed from the office, and informed only by Barton's report of the system by which the matter outside her own department was gathered, she was often driven to wonder, as she held a fresh issue in her hand, where all the good things had come from. Her judgment told her that it was in fact quite as presentable a sheet as in the good days when Rignold was by her side; but though she would have been glad to believe this for the sake of the future, she denied it to herself resolutely, with a sentiment of loyalty to her old associate; and out of the same feeling, coupled with a knightly unwillingness to think ill of a rival, she put away from her the doubt whether the "Apex" was, after all, as good a paper as her own.

Rignold had never worked harder than he was now working on the "Apex." He had never reached the "Telepheme" office so early as he now reached the office of the "Apex," nor left it so late. He had promised himself not to see Berna again for a long time to come; his news of her came by way of the town. All that he knew of her was gathered from observation of the outside of her home, as he passed it, morning and night, on his way to or from his canvas-roofed cabin on Ticknor's Mountain. Three months passed without giving him a sight of her, until, passing her house after midnight one night on his way home from the office, he saw a light burning in her bedroom, on the upper floor, and knew that she was sitting up, writing. The gravel which he threw softly against the pane brought her instantly to the window. For a moment she looked bewilderedly about in the unaccustomed darkness, straining her eyes first upon the road where Rignold was standing in the shadow, and then over toward the huge black frame of Ticknor's swelling up behind the opposite row of houses, and darkening against the starless sky.

"Well, 'Telepheme'?"

The figure in the window drew back, startled; but in a moment the answer came softly:

"Well, 'Apex'?"

He came out of the shadow.

"Is that you, Ben?"

"Yes," said Rignold. "Remember your promise!"

"What?"

"Go to bed!"

"Oh!" She laughed, and her laugh seemed to Rignold to widen musically into the night in waves of pure joy. "All right." She leaned out of the window for a moment in silence. "Why are n't you in bed yourself?"

"Been fighting you."

"Well, that takes time. How's the 'Apex'?"

"Blooming. How's yours?"

"I've lost a good deal of advertising."

"They tell me half the circulation's gone. Is that true?"

"Yes; but my courage is n't—nor my money. I think I like aggression."

"Hope the 'Apex' gives you plenty."

"Yes; enough. But I don't want to beg off, Ben."

"Well?"

"I'm glad we made that arrangement. You give me all I want to do sometimes; but you do fight fair."

"I've got a scorcher on you in my next."

"Have you?"

"Yes."

"Then I must go to work. Good night, Ben."

"Oh, see here, Berna; don't do that."

"Do you want me to let the 'Apex' have it all its own way?"

"No; but you ain't going to do any more work to-night. Look here—I'll put it off to the issue after next."

"Well! Will it keep?"

"Keep? An article against you? Like ice at zero!"

"Then I won't prepare my answer till next week. Good night.—Oh, Ben!"

"Well?"

"I'm preparing a surprise for the 'Apex.'"

"No?"

"Yes. You remember my speaking of that girl with the strange character who used to go to school with me at Kansas City before I went East to Miss Drewett's—Dodo McFarlane? She's just married to Mr. Mutrie, the President of the Three C's, and she's coming here on her wedding journey. I had her letter to-day, and I've written to invite them to stay here with me."

Rignold allowed an expressive whistle to escape into the darkness.

"It is interesting, is n't it?" continued Berna.

"Interesting? It's a scare-head sensation news item. I'll have to get to work myself. Good night."

She leaned a little further out of the window. "You won't divulge my secret, of course. I'm keeping it to surprise the town."

"Oh, I won't give you away. Go to bed!"

"I will. I'm so glad to have seen you again, Ben."

"That 's right. Good night."

He disappeared up the dark road, and Berna closed her window.

When Rignold reached the Bloxham Block next morning he found Dibble in the narrow stall he had partitioned off from the composing-room for his office. His visitor dropped his feet from the table to the floor as he entered, and rose, folding up a copy (Berna and Rignold of course exchanged) of the last issue of the "Telepheme." Dibble shook himself down into his trousers with a frown.

"Morning," said he.

Rignold nodded as he swept a space clear on his desk, and settled down to work.

"Been losing Hymee, the hatter, I see," continued his visitor, dusting his hand with Berna's paper.

"Mr. Hymee has seen fit to withdraw his advertisement, if that 's what you mean, Mr. Dibble."

"Yes; I've been around to see him this morning. He says he wants to see our paper succeed. He ain't got nothing against it, and he ain't going to support our lady contemporary, anyway. But, 'See here, now,' he says, 'your paper —'"

"My paper, please, Mr. Dibble."

"Well, yours, if you like to call it so."

"I like to stick to facts, if it 's all the same to you. Has anybody got a dime in the 'Apex' besides me?"

"Certainly not. But we feel as if we were supporting you. I suppose you don't mind our holding up your hands?"

"Not if you leave them free," returned Rignold, whirling about in his swivel-seat, tilting it back, and thrusting his hands into his pockets. "What does Hymee say?"

Dibble did the "Telepheme" up into a newspaper-carrier's wad, as if he were meditating throwing it over a subscriber's fence into the front yard, before he answered: "Why, it 's this way. Hymee says that woman-mush across the way, that some folks in this town call a newspaper, is knocking the stuffing out of us fellows, and we don't know what 's happening to us. He's opposed on principle to a lady paper, but he goes in for straight talk, and he says there ain't no comparison between the 'Apex' and the 'Telepheme,' and that every one says so."

"That 's just what we've always supposed, ain't it?"

"Not Hymee's way. He tried to prove to me that there was n't the hustle of a dead steer

about our whole outfit; he says the 'Apex,' as at present conducted, has n't the romp and the razzle-dazzle to run an engine down a two-hundred-foot grade, let alone pulling the Three C's into Rustler. Now, don't get riled! He did n't mean you, of course."

"I 'm all right, Mr. Dibble," said Rignold, raising his eyebrows. "Go on."

"That 's all. But it occurred to me — I was wondering —"

"Yes. Well?"

"He 's away off. We know that. But it simply occurred to me that it was a sort of hint. Perhaps we *could* put more —"

"Work?"

"No, sir. You *work*. But more roar and slam-bang, more git up and howl. That 's what does the business."

Rignold surveyed him thoughtfully for a moment, as a silence fell.

"Do you want to buy the paper, Mr. Dibble?"

"Well, no — no. I can't say as I do."

"Know any one else that wants to buy it?"

"No."

"All right, then. I 'll run it myself. Good morning."

Within a week two more small advertisements were withdrawn from the "Apex"; and the day after the publication of the succeeding issue, B. G. Franks, dealer in boots and shoes, who had been one of Rignold's original supporters, called at the office to say that he felt forced to withdraw his advertisement temporarily, as an expression of his disapproval of the course of the "Apex"; but should be happy to restore it as soon as Rignold saw his way to making a better paper. Rignold perceived Dibble's hand in this, and smiled; it was what Dibble would have called "bringing pressure." No more advertisements from members of the original committee were discontinued; but subscriptions began to fall off. Even from the surrounding country orders reached Rignold to stop the paper; and no new subscriptions were recorded.

A month later, when Mutrie reached Topaz with his young bride, and stopped over a day, Rustler gnashed its teeth. Dibble, who had now turned frankly against Rignold, swore outright. The news was discussed on the corners of the mountain street by excited groups, like another Bull Run. It represented, stated in the soberest terms, nothing less than disaster to the town that the President of the Three C's should stop at Topaz, and not so much as pass through Rustler. A committee, consisting of Dibble, McDermott, and Franks, was formed to go down to Topaz by the afternoon train, and invite the President at least to take a look at the town. But before they could start, Berna,

who had been holding back her edition of that week for a telegram from Mrs. Mutrie, making all sure, got the "Telepheme" upon the streets. It set forth her news so modestly that at first no one would believe it. The office of the paper was instantly filled with inquirers — Dibble among the first.

"She 's got a telegram, I tell you," said Barton.

"Shoot your telegram! Let 's see it."

Barton left them clamoring, and went to ask Berna's permission. As he came back up the street, holding the fluttering bit of paper aloft in his hand, the group outside of the office gave an uncertain cheer; then, as Dibble snatched it and read it aloud, they howled with glee. Some were for going straightway to Berna's house, and offering her the cheers at closer quarters; but every one was in favor of a drink, and for the moment it resolved itself into that. It was about eleven o'clock that night when a little torchlight procession made its way to Berna's house, and relieved in complimentary song its enthusiasm, its happiness, its renewed good will to Berna, and perhaps a little shame-faced repentance and regret.

She was obliged at last to appear in her doorway; but, apparently overcome by emotion, could say nothing until, as she stood swaying on the threshold, she caught sight of Rignold's white face in the midst of the flickering lights, on the fringe of the crowd. Then, plucking up courage, she began tremblingly:

"FELLOW-TOWNSMEN: I am grateful to you for this unexpected honor. Believe me, it touches me deeply. But I must not, even for a moment, take it to myself. It belongs, you and I both know, wholly to another. I lay it proudly at the feet of Alexander Chester."

Rignold's face suddenly disappeared, and a voice from the crowd shouted, "No, no!" As she lost sight of the sustaining eye on the outmost circle of her audience, something seemed to give way within her; the denial roused her, however.

"But I say, 'Yes.' Let no one, thinking to please me, refuse to Alexander Chester the praise and the reward that are so utterly his due, and which belong to him, and him alone. Fellow-townsmen, it was he who first fought your battle for the railroad; it was he who first led you to dream of the possibility of bringing the Three C's to Rustler; it was he whose ringing words, going forth from week to week in the columns of his paper, have made the coming of the road practicable and realizable and near; and he it was, too, whose labors for the town, in cooperation with the strong and willing hands of those I see before me to-night, have brought Rustler to a position where she *deserves* the railroad!" ("Good! Deserves! That 's

the ticket!" murmured the crowd.) "Whatever I may have been able to do has merely been in humble following of his footsteps. If he had not lived, in all human probability, none of us would be here to-night. When you say a word in praise of me, I must take it, therefore, as intended to be two for him; for he is not only the source and inspiration of everything that I may do, but even in death he watches over us — the guide, the counselor, the captain of our town!"

She paused, and the crowd burst into wild cheers.

"The captain! Hip! Hip! Hurrah! Hurrah! Hurrah! *Tiger!*"

Berna smiled upon them from her doorway, beautified.

#### IV.

AN hour later, against all protests from her mother, she left her home for the first time in many months. Strength came to her with her need; that one sweet little moment of success, which compensated for all that she had borne for the town, and for all she had suffered at its hands, seemed to give a lost physical soundness and courage back to her. She felt strong enough for anything; and with that wine of happiness coursing through her veins, she certainly felt strong enough to drive to Barton's. The depression of the past months, since the launching of the "Apex," had made her nervous and doubtful about prosperity; she dared not trust any one to take it by the hand but herself. To be ready for the demand on the morrow, she meant to get Barton to go to the office and to print at once, before morning, on Aleck's old hand-press, five hundred copies of the new issue of the "Telepheme"; and to make quite sure, she meant to drive to the office with him, to see the fresh edition started. The paper had not been obliged to print twice since Aleck's time. She must watch her boom. Her heart beat high.

At Barton's there was no one but his wife. She said her husband was already at the office.

"Seems to me," she lamented, "he 's always at that office. I suppose his new work 's a good thing; but it takes him away a sight of time. I don't believe he 's been a night at home since he began it."

Berna wondered, but drove on, drawing her wraps tightly around her against the unaccustomed air. Except for the lights at the European Hotel and at the Elegant Booze, the town was dark. Straggling groups from the serenading party still paraded the streets, singing, and lurching noisily in one another's arms. Berna gazed meditatively at the dusky roofs of the town to which she had given a year's loving

service, and which she had not seen since the warm, sunny morning when she had driven with Aleck to the station to take the train. The town knew her now; but what difference if it did not? *He* knew!

As she toiled up the dark staircase leading to the "Telepheme" office, supporting herself by her stick, a crack of light shone into her eyes from under the door; and she heard the old press jammed down sharply within. Barton had plainly guessed her thought and gone silently to work. How good every one was to her!

She turned the knob and went in. A gush of light greeted her. The place was all illumined. Barton was at the press; the boy was hurrying about. From the inner room a voice she knew cried out:

"We shall have to put that silver editorial over to the issue after next, Barton. Our next issue will have to be a kind of Jubilee Mutrie number—editorials, locals, everything. I'll do the squibs this week and an account of the President's visit, if you'll look after my regular locals."

"All right," responded Barton from his press. After a moment he looked up and saw Berna standing there.

"Why, Miss Dexter!" he exclaimed, mechanically stopping the press. He came toward her, wiping his hand, which, however, he finally wrapped in a corner of his printer's apron and offered to her that way.

"You ought to have sent for me," he said, abstractedly.

She looked at him for a moment.

"Who's in there?"

"What?" asked Barton, offering her a chair, with a doubtful glance over his shoulder.

She pointed.

"Oh, there. Nobody, I guess."

"Will you do me a favor, Mr. Barton?"

"Yes, of course. I don't know."

"Take this chair." Barton seated himself, and stared after her as she pushed quickly into the room where Rignold sat writing busily at his old desk, which was littered with proofs and manuscript.

"Berna!" he exclaimed, looking up as she entered.

"Ben Rignold, what are you doing here?"

"Getting up a little copy. I often come on here of an evening to do my work, from old habit. You don't mind, I hope?"

"You mean *my* work!"

"I did n't say so."

"You don't need to. I heard you just now give your order to Barton. Ben! Ben!—You're just wicked!"

Tears filled her eyes. She sat down suddenly.

"Let me move those," he said, rising, and coming to her quickly; and she saw that she had seated herself on a chair heaped with a pile of old exchanges. He moved them to another chair, avoiding her eyes, which followed him everywhere. As he took his seat again under the lamp, which threw down a strong writing light upon the table, she saw how worn he looked. There were purple rings under his eyes, and his face was drawn. His disordered hair, which he had probably tumbled as he wrote, gave him a wild look. It was three months since she had seen him closely by daylight. She reproached herself bitterly.

"You're too good to breathe!" she murmured, in continuance of her indictment, as she fastened her eyes on him. "How dared you? Why did n't you tell me?"

"See here, Berna, why did n't you stay at home? Then you would n't have known."

"Well, I'm glad enough I came," she said, still breathless.

"Well, then, I ain't."

"So it's you, Ben Rignold, who have been making my paper better than the 'Apex'!" she went on, unheeding. "It's been you from the beginning." She stopped suddenly, startled. "Then it must be you, too, who have made the 'Apex' sô bad!" she added.

Rignold smiled. "Did you think it was bad?"

"Never till now, I never let myself. But I know now that it's been the worst paper in the State!"

"Did you expect me to make it the best, with your paper across the way?"

"I did n't expect you to make *mine* the best! O Ben!"

"Pshaw! that was easy," he said, laughing. "The trouble's been to make the 'Apex' poor enough without giving the scheme away. I've always been afraid that you'd tumble, if the town did n't. Come, Berna! You did n't suppose I was working at that rate to *succeed*, did you?"

"I thought—" began Berna, tremulously.

"Then take it back, please! The man who could n't succeed, with that paper and that backing, by smoking cigars in his rear office, ought to give up the business. To make such a paper *fail* takes work!"

"Ben," she exclaimed, "you've ruined yourself!"

"Oh, no, I have n't. But I've ruined the 'Apex.' The sheriff is to pay me a visit tomorrow. Nobody knows it yet; but I may as well tell you, because it'll be all out in the morning. I *had* hoped to fail last week. But I could n't get enough advertisements and subscriptions dropped."

She looked thoughtfully at him for a mo-

ment. "Ben, I believe you 're the best man in the world," she said solemnly.

"I guess not," laughed Rignold, uneasily.

"You are," she repeated. "And, Ben—"

"Yes?"

"You must n't fail!"

"But I've got it all fixed. After to-morrow there won't be but one paper in Rustler."

"That's what I mean," she said huskily.

"Let's *make* it one—the 'Telepheme-Apex'!

Let's—consolidate!"

"Berna!"

"Well?" she answered, looking down with a deep blush.

He came and stood over her, and laid a hand upon her chair. "Berna, do you mean it?"

She looked up with tears streaming down her face.

"I guess so."

"And Aleck?"

She smiled happily through her tears as she laid a hand in his.

"Ben, dear, *we* will keep up the fight!"

*Wolcott Balestier.*

## BOOKS AND SEASONS.

BECAUSE the sky is blue; because blithe May  
 Masks in the wren's song and the lilac's hue;  
 Because—in fine, because the sky is blue  
 I will read none but piteous tales to-day.  
 Keep happy laughter till the skies be gray,  
 And the sad season cypress wears, and rue;  
 Then, when the wind is moaning in the flue,  
 And ways are dark, bid Chaucer make us gay.  
 But now a little sadness! All too sweet  
 This springtide riot, this most poignant air,  
 This sensuous sphere of color and perfume!  
 So listen, love, while I the woes repeat  
 Of Hamlet and Ophelia, and that pair  
 Whose bridal bed was builded in a tomb.

*Thomas Bailey Aldrich.*

## ARCHITECTURE AT THE WORLD'S COLUMBIAN EXPOSITION.

THE World's Columbian Exposition was organized April 9, 1890, and on the 25th of the same month Congress passed the bill giving Chicago the honor of this great enterprise. On July 1 following, Jackson

Park and the lake front of Chicago were selected as the double site of the Exposition. On the 20th of August F. L. Olmsted & Co. were elected consulting landscape-architects. Between then and the following December the organization of the Department of Construction was perfected by the appointment of D. H. Burnham as chief and of J. W. Root as consulting architect, Mr. Burnham having acted as professional adviser from the beginning of the enterprise. Undoubtedly to his sagacity, energy, and breadth of view, and to his wide experience in important architectural work, the Chicago Commission is largely indebted for the great effective working capacity which it has developed; and under his organizing power the complicated machinery of administration in respect to grounds and buildings was fairly established.

For reasons which we need not state, the double site was finally abandoned; and it then became the duty of the Committee on Grounds and Buildings, under the advice of their chosen experts, to review this all-important question of locality, and to discover, if possible, within the limits of Chicago, or in its near vicinity, an area of land capable of containing, without crowding, a series of buildings which, in the aggregate, should be at least 50 per cent. larger than those of the last Paris Exposition; should be conveniently and economically accessible for visitors and for material; not divided by railroads, streets, creeks, or cemeteries; and not so encumbered with buildings or other improvements that it would be difficult to obtain possession of it and to prepare it for the reception of the structures of the Exposition.

Of the few places answering these requirements all were flat, low, and, from a horticultural point of view, unsatisfactory. The only large, agreeable, or dignified element of scenery within many miles of the town was the lake, and there was discovered only one place on the lake presenting the desired conditions. This was a tract of five hundred acres between six

and seven miles south of the central part of the city, with a length of a mile and a half on the lake side and three quarters of a mile in width. Topographically the place consisted of a series of low sand-dunes which had been thrown up successively by the lake in lines nearly parallel with the shore, the most considerable of them having an average height of not more than six feet above the high stages of the water. Between these dunes there were broad, low, flat, swampy swales, subject to occasional floods, with water generally standing one or two feet below the surface. On some of these dunes groves of small, stunted oaks were growing, and the intermediate flats were more or less overgrown by sedge and water-grasses.

This tract belonged to the South Park Commission, having been obtained twenty years before with a view to its future improvement as a public park. Practically it was in a state of nature, as we have described, except as to a limited area at its northern end, which had been graded, planted, diversified by ponds, and made accessible by drives and walks. The disadvantages of this site were sufficiently obvious; but it was considered that they, together with the inconvenience arising from its distance from the thickly populated parts of the city, would be offset by these advantages: first, that it was unencumbered with buildings; secondly, that it could be made readily accessible, either by boats on the lake or by public land conveyances of various sorts, without numerous railroad or river crossings; and thirdly, that a number of railroads passed within a few hundred feet of the landward boundaries of the tract, extending in one direction nearly to the heart of the city, and, in the other, connecting, or easily to be connected, with lines to all parts of the continent. Indeed, to the experienced eye and instructed imagination of the landscape-architects the very qualities in this desert-like waste which presented the most formidable obstacles to the realization of anything approaching the horticultural splendors, or finished park-like aspects, of previous international expositions suggested the possibility of procuring out of these most unpromising elements effects quite unusual, yet of a wholly appropriate character. The broad expanse of the great inland lake itself, with its ever-changing surface and its oceanic horizon, its waters prospectively alive

with sails, and animated by the incessant movement of steamers and craft of every sort, "ornate, bedecked, and gay," beneath the unlimited summer sky, would give to the *mise-en-scène* a peculiar character, under the influence of which the foreign visitor might forget to ask for that metropolitan opulence of shaded park-land which here could not be obtained. Steam-dredges and the railroad grading-processes of the West could readily at small expense enlarge the areas of higher land, and create level plateaus and stately terraces as sites for the great buildings of the Exposition, with material excavated from the wet and sedgy intervals, converting the latter into a system of lagoons connected with the lake by walled canals and basins. Thus might be created within the grounds an interior water-system, four miles in length, which would be navigable by omnibus-boats, conveying visitors from every quarter of the Park to landings before each of the principal buildings.

Under such circumstances the landscape-architects felt authorized to recommend to the committee the use of the grounds known as Jackson Park, which, after much negotiation with the South Park Commissioners, and much controversy with those advocating other sites, were finally obtained under the agreement that, after the Exposition and after the removal of the buildings, they should be left in a condition well adapted to be formed into a permanent public park for the city. A succession of ingenious plans was then prepared and reported to the committee by these gentlemen, in intimate connection with Messrs. Burnham and Root, illustrating the gradual development of a general scheme for the occupation of the site, Mr. Root making sketch-designs of all the buildings as the work progressed. The leading motives of composition were to obtain such a disposition of the greater buildings as should make the best and most effective use of the natural conditions of the ground, when modified and corrected by the art of the landscape-architect; should give to these buildings a proper and articulate relation, one to the other, and also to the water-system of the Park; should group them in a formal and artificial manner at those points where their great size and necessary mutual proximity invited a pre-dominance of architectural magnificence, or picturesquely and accidentally, where the conditions of the landscape were such as to forbid a close observance of axial lines and vistas. But all these dispositions were made subordinate to the situation furnished by the wide expanse and horizon of the lake, so that this important element of composition should have its due value from all the principal points of observation.

Another fundamental condition affecting the general dispositions of the plan was the method of reaching the Park by the seven railroads, so that the difficult problem of debarking and embarking more than 60,000 people every hour by these means of transit should be solved with the least confusion, and at a point where the visitor should be introduced to the grounds through a monumental vestibule, from which a scene should open, stately, splendid, and surprising, alike in its architectural and in its natural elements. It was necessary, also, to consider every means of approach by street-cars and by water,—the latter suggesting the provision of moles and protected harbors on the lake side,—and also to provide for an additional intramural communication by some form of elevated railway.

None of the difficulties to be surmounted, however, were greater than those presented by the necessity of converting into a garden a tract of land which was almost a desert waste; so that the grounds in which the great monumental buildings of the Exposition were to be placed should be set forth with something more than formal architectural terraces, balustrades, bridges, statues, fountains, and canals, and should enjoy at least some of the advantages to be obtained from ordered or picturesque vegetation. Unlike the sites of former expositions, located in the heart of ancient civilizations, the prairies of Illinois afford no imperial treasuries of trees and shrubbery, from which the modern Amphion could draw the means of establishing such vast, full-grown masses of foliage as were needed adequately to decorate these impoverished acres. When the thick ice which is formed on Lake Michigan during the winter is broken up, it is driven by prevailing north winds toward Chicago, and there lingers to prolong the tardy spring. A little later, while the first leaves are unfolding, a night gale from Canada sweeps over these five hundred miles of ice-cold water, and all forms of vegetable growth along the southern margin of the lake are discouraged and delayed. Moreover, the fluctuations which are characteristic of the waters of the lake, not only from day to day, but in its normal and average elevations during the summer, must create bare and dreary shores where the intramural water-system of the Park expands from the formal, stone-bordered canals into the broad and picturesque lagoon.

To obviate these difficulties it was determined—first, so to treat the existing groves of trees that their dwarfish character would be masked by the introduction of hardy, indigenous shrubs around the margin of each group, thus creating effects of massed foliage, as seen from a distance; secondly, to edge the water with a

nearly continuous strip of reedy, aquatic plants, which would bear occasional submergence; and thirdly, to provide these with backgrounds of low foliage, chiefly shrub willows and brightly flowering local plants. Occasional stretches of well-kept lawn would also, where necessary, serve to refine the rustic aspect of the grounds.

At the outset the Committee on Grounds and Buildings, together with D. H. Burnham, Chief of Construction, were confronted by a delicate and difficult problem. How were the designs for these great buildings to be obtained? Should one architect be appointed for the whole, or, in view of the more practical alternative of appointing one architect for each building, should these be selected by general competition, by limited competition, or by direct selection? After a careful review of the subject, it was concluded by the committee, in accordance with the rec-

1 Innumerable experiments with architectural competitions have made it clear enough that, of all the methods of selecting the architect, this is the most wasteful, unscientific, tedious, costly, demoralizing, and uncertain. It is almost impossible to devise a competitive scheme which will, as its result, secure to the building the best service, or to the competitors an opportunity to express their most useful qualities as architects. It seems equally evident that the establishment of confidential professional relations in the beginning with an architect chosen because of his proved ability and experience, and not because of the accident of his success in a game of chance, is economical of time and money, and consistent with honest business principles. Therefore, the action of the Committee on Grounds and Buildings in this case is so memorable in the history of architectural practice, that we deem it important to print here the report upon which this action was based. This report was prepared by Mr. Burnham, and, at his request, was signed by all the professional advisers of the committee.

Dec. 6, 1890.

THE HONORABLE THE COMMITTEE ON GROUNDS AND BUILDINGS, WORLD'S COLUMBIAN EXPOSITION.

*Gentlemen:* Preliminary work in locating buildings, in determining their general areas, and in other elementary directions necessary to proper progress in the design and erection of the structures of the Columbian Exposition, has now reached a point where it becomes necessary to determine the method by which designs for these buildings shall be obtained.

We recognize that your action in the matter will be of great importance, not only in its direct effect upon the artistic and commercial success of the Exposition, but scarcely less upon the aspect presented by America to the world, and also as a precedent for future procedure in the country by the Government, by corporations, and individuals. In our advisory capacity we wish to recommend such action to you as will be productive of the best results, and will at the same time be in accord with the expressed sentiments of the architectural societies of America. Whatever suggestions are here made relate to the main buildings located at Jackson Park.

That these buildings should in their designs, relationships, and arrangement be of the highest possible architectural merit is of importance scarcely less great than the variety, richness, and comprehensiveness of the various displays within them. Such success is not so much dependent upon the expenditure of money as upon the expenditure of thought, knowledge, and en-

ommendations contained in a remarkable memorial presented to them by their professional advisers, to give to the architectural part of the Exposition, so far as possible, an appropriate national character, by making a direct selection of representative architects; thus not only avoiding the serious delays and embarrassments which would inevitably accompany any form of competition, but at the same time enlisting the services of a body of professional experts to consider the architectural questions from the beginning and as a whole, and to lay out a scheme of efficient and harmonious coöperation.<sup>1</sup>

On January 12, 1891, the invited architects, Messrs. R. M. Hunt, George B. Post, and McKim, Mead, and White of New York, Peabody and Stearns of Boston, Van Brunt and Howe of Kansas City, together with Messrs. Adler and Sullivan, S. S. Beman, Henry Ives

thusiasm by men known to be in every way endowed with these qualities, and the results achieved by them will be the measure by which America, and especially Chicago, must expect to be judged by the world. Several methods of procedure suggest themselves:

*First.* The selection of one man to whom the designing of the entire work should be intrusted.

*Second.* Competition made free to the whole architectural profession.

*Third.* Competition among a selected few.

*Fourth.* Direct selection.

The first method would possess some advantage in the coherent and logical result which would be attained. But the objections are that time for the preparation of designs is so short that no one man could hope to do the subject justice, even were he broad enough to avoid, in work of such varied and colossal character, monotonous repetition of ideas. And, again, such a method would evoke criticism, just or unjust, and would certainly debar the enterprise from the friendly coöperation of a diversity of talent, which can be secured only by bringing together the best architectural minds of our country. The second method named has been employed in France and other European countries with success, and would probably result in the production of a certain number of plans possessing more or less merit and novelty. But in such a competition much time, even now most valuable, would be wasted, and the result would be a mass of irrelevant and almost irreconcilable material, which would demand great and extended labor to bring into coherence. It is greatly to be feared that from such a heterogeneous competition the best men of the profession would refrain, not only because the uncertainties involved in it are too great and their time too valuable, but because the societies to which they almost universally belong have so strongly pronounced on its futility. A limited and fair competition would present fewer embarrassments, but even in this case the question of time is presented, and it is most unlikely that any result derived through this means, coming as it would from necessarily partial acquaintance with the subject, and hasty, ill-considered presentation of it, could be satisfactory, and the selection of an individual would be open to the same objections made above as to a single designer. Far better than any of the methods seems to be the last. This is to select a certain number of architects, choosing each man for such work as would be most nearly parallel with his best achievements; these architects to meet in conference, and become masters of all the elements of the problems to be solved, and agree upon some general scheme of procedure. The preliminary studies re-

Cobb, W. L. B. Jenney, and Burling and Whitehouse of Chicago, were called together to consult with the chief of construction, the consulting architect, and with Frederick Law Olmsted and his partner, Henry Sargent Codman of Boston, regarding the architectural conditions involved in the scheme of the Exposition. The latest plans of the consulting architect and landscape-architects, which, as a whole, had been accepted by the National Commission and by the Chicago directors, were laid before this board of architects for consideration. After an exhaustive study of the whole problem, during which many revisions and modifications more or less fundamental were suggested and considered, it was finally resolved to recommend to the Committee on Grounds and Buildings the acceptance of the general scheme of location of buildings and waterways, as prepared by Messrs. Root, Olmsted, and Codman, with but little modification. In fact the problem had been developed by these gentlemen with so much skill and with such exact forethought for all the conditions embraced in this vast complication of interests, and the several stages of development had been so intelligently discussed by the committee and by the chief of construction, that it was evident to the board of professional experts that they could devise no better starting-point for their specific part of the work.

The sudden death of Mr. Root, after a very brief illness, during these preliminary sessions of the Architectural Board, deprived this great enterprise of services which would have been of peculiar value in perfecting the architectural work, and which already had been an essential factor in laying out the general scheme of the buildings, and in facilitating an effective, fraternal coordination of professional labor such as rarely, if ever, has occurred in the history of architecture. The strong initiative force furnished by the generous enthusiasm and bright genius of Root remained, however, with the Architectural Board, and has been an element constantly working for unity and strength in its councils.

In all projects relating to the decoration of the grounds by sculpture and monumental fountains, the large experience and eminent authority of Mr. Augustus St. Gaudens have been forces working silently for higher art, greater nobility of expression, and more effective results. Unfortunately the work of his own hand will not appear in these decorations; but his advice in the selection of sculptors for

consulting from this to be compared and freely discussed in a subsequent conference, and, with the assistance of such suggestions as your advisers might make, to be brought into a harmonious whole.

The honor conferred upon those selected would create in their minds a disposition to place the artistic quality of their work in advance of the mere question of emolument; while the emulation begotten in a rivalry so

them has been of permanent value, and has been followed with generous intelligence and to the manifest advantage of the Exposition.

The basis of operations is explained by the plan of the grounds herewith presented, which exhibits in outline the result, not of the latest studies, but of that stage of the work reached at the time when it was necessary to prepare the map for the purpose of illustrating this paper. In a subsequent paper we hope to present a more comprehensive plan, indicating the nature of the modification to which the whole scheme has been subject from month to month. It will be observed that there are three grand divisions. Of these the northernmost, which had already been laid out as a park by the city, is to be occupied centrally by the Department of Fine Arts, the State pavilions being grouped north and west of it; while the foreign government buildings will be placed east of it, toward the lake, and, if occasion requires, in the Plaisance, which is a long reserved tract 600 feet wide between 59th and 60th streets, forming a boulevard approach to Jackson Park from the west. In this tract also areas have been granted to foreign enterprise for the establishment of model villages and groups of pavilions illustrating the characteristics of domestic and industrial life in remote countries.

The middle division is formed by the lagoon, the most characteristic landscape feature of the grounds. This is an irregular, artificial water-way surrounding several islands, the largest among them being a wooded tract about 1700 feet long and from 200 to 500 feet wide, the natural conditions of which will be enhanced by aquatic shrubbery and flower-beds, with kiosks and rustic pavilions approached by bridges. A part of the northern end of this island has been applied for by, and will probably be granted to, the Japanese commissioners, who propose to lay out a considerable area in a characteristic garden, according to their ancient traditions in this art, and to embellish it with exact reproductions of several of their most venerable temples. The outer margins of the lagoon will be occupied on the west by the Transportation Building, by the Horticultural Building, with its gardens, and by the Woman's Building; on the east, toward the lake, will stand the Palace of Manufactures and Liberal Arts, and the United States Pavilion. The lagoon branches capriciously northward and eastward, giving water-fronts to the Pavilion of Fine Arts, to the Illinois State Build-

ing and friendly could not fail to be productive of a result which would stand before the world as the best fruit of American civilization.

ing, and to the Fisheries and United States Government buildings. Southward this irregular quadrangle is closed by the north façades of the Mines and Electricity buildings.

The lagoon connects southward with a system of formal stone-bordered canals and basins, where will be symmetrically placed the great plaza, or *cour d'honneur*, of the Exposition, a regular quadrangle 700 by 2000 feet, about equal in size to that of the last Paris Exposition. Water-communication will be provided for at the east end of this court, and the system of railroads will debouch at the west end in a railroad terminus, masked by the Administration Building, which will be treated so

as to serve as the monumental porch of the Exposition. From the railroad terminus, through the arches of this porch and beneath its lofty dome, the visitors will enter the court, which is bounded on the right hand (southward) by the Departments of Machinery and Agriculture, on the left (northward) by those devoted to Mines, Electricity, and to Manufactures and the Liberal Arts, and in front (eastward) by Lake Michigan. The center of this court is occupied by a great artificial basin which forms a part of the water-system of the Park. Connecting with this basin, a broad canal, bordered by double terraces and crossed by arched bridges, will run southward into a minor court between the pal-

aces of Agriculture and Machinery. This minor court will be closed toward the south by an architectural screen in the form of an arcade on the first story and a colonnade on the second, with a triumphal arch in the center, through which the visitor will enter the Department of Live Stock, which constitutes the southernmost feature of the Exposition. Opposite this canal, on the same axis, is another of similar character, running northward between the Departments of Electricity and the Liberal Arts, and connecting, as we have already seen, with the waters of the lagoon.

This brief description, aided by the topographical views which we present, may serve to give in outline the general architectural scheme of the Exposition-grounds. The relative positions of the buildings being understood, we may now devote ourselves to a consideration of the architectural motives which underlie the designs of the buildings, and confer upon them character and significance as works of art. In other words, we do not attempt a description of these buildings, still less a criticism,—which would be premature,—but an analysis of the principles according to which they have been severally developed. We purpose, in fact, to put ourselves in the position of the architect when first confronted by his problem, and, as far as possible, to outline some of the processes of investigation and study through which his work gradually grew into its final form. Of course it would be impracticable to indicate the numerous false starts, the erasures, the studies tried and abandoned, and all the long tentative processes which must in every case be labored through before the scheme of a building takes its ultimate shape. The main object of these papers will have been attained if they may serve to show how a work of architecture, like any other work of art, is the result of logical processes studiously followed, and not a mere matter of taste, a following of fashion, or an accident of invention more or less fortuitous.

THE highest claim which can be made for modern architecture must rest on those characteristics of ornamented or ordered structure which have grown out of the unprecedented exigencies of modern buildings. Wherever these exigencies have been met in such a spirit that a corresponding development of style has been produced, justly differentiated from all other historic or contemporary styles not by caprice, but by growth, there exists a living and progressive art, which, like all other living arts in history, will stand as the exponent of the civilization under which it obtained its definite form. Probably the largest, the most deliberate, and the most conspicuous expression of the present

condition of architecture in this country will be looked for by foreign critics on the grounds of the World's Columbian Exposition; but they will find it rather in the latest commercial, educational, and domestic structures in and near our larger cities. By these our architecture should be judged. It is true that the industrial palaces of our Exposition will be larger in area than any which have preceded them, and will surpass in this respect even the imperial villas and baths of the ancient Romans. But they will be an unsubstantial pageant of which the concrete elements will be a series of vast covered inclosures, adjusted on architectural plans to the most lucid classification and the most effective arrangement of the materials of the Exposition, and faced with a decorative mask of plaster composition on frames of timber and iron, as the Romans of the Empire clothed their rough structures of cement and brick with magnificent architectural veneers of marbles, bronze, and sculpture. Mr. Burnham, the Chief of Construction, rubs his wonderful lamp of Aladdin in his office at Chicago, and the sudden result is an exhalation, a vast phantasm of architecture, glittering with domes, towers, and banners, like the vision of Norumbega, which presently will fade and leave no trace behind. But these shapes do not make themselves. There is, it is true, a creative energy, followed by an apparition of palaces and pavilions; but between the energy and the apparition are the consultations, the experiments, the studies of a very palpable board of representative architects of the nation, who have learned that this great architectural improvisation requires as much of their zeal, labor, knowledge, and professional experience as if they were planning to build with monumental stone and marble. However temporary the buildings, the formative motives behind them will be on trial before the world; for these motives, disembarrassed as they have been, to a great extent, of the usual controlling considerations of structure and cost, and concentrated upon the evolution of purely decorative forms, have made demands upon our resources of art such, perhaps, as have been required by no previous emergency in architecture.

The liberality exhibited by the management and by the architects of Chicago toward their brethren summoned from other cities has been more than generous. To the latter were assigned all the buildings around the great court, a compliment which involved the most serious responsibilities, and of which the only adequate recognition could be an especial effort to justify it. In view of the fact that these buildings had a mutual dependence much more marked than any others on the grounds, and that the formal or architectural character of the court abso-

lutely required a perfect harmony of feeling among the five structures which inclose it, it became immediately evident to these gentlemen that they must adopt, not only a uniform and ceremonious style,— a style evolved from, and expressive of, the highest civilizations in history,— in which each one could express himself with fluency, but also a common module of dimension. These considerations seemed to forbid the use of medieval or any other form of romantic, archaeological, or picturesque art. The style should be distinctly secular and pompous, restrained from license by historical authority, and organized by academical discipline. It was not difficult, therefore, to agree upon the use of Roman classic forms, correctly and loyally interpreted, but permitting variations suggested not only by the Italians, but by the other masters of the Renaissance. It was considered that a series of pure classic models, in each case contrasting in character according to the personal equation of the architect, and according to the practical conditions to be accommodated in each, but uniform in respect to scale and language of form, all set forth with the utmost amount of luxury and opulence of decoration permitted by the best usage, and on a theater of almost unprecedented magnitude, would present to the profession here an object-lesson so impressive of the practical value of architectural scholarship and of strict subordination to the formulas of the schools, that it would serve as a timely corrective to the national tendency to experiments in design. It is not desired or expected that this display, however successful it may prove to be in execution, should make a new revival or a new school in the architecture of our country, or interfere with any healthy advance on classic or romantic lines which may be evolving here. There are many uneducated and untrained men practising as architects, and still maintaining, especially in the remote regions of the country, an impure and unhealthy vernacular, incapable of progress; men who have never seen a pure classic monument executed on a great scale, and who are ignorant of the emotions which it must excite in any breast accessible to the influences of art. To such it is hoped that these great models, inspired as they have been by a profound respect for the masters of classic art, will prove such a revelation that they will learn at last that true architecture cannot be based on undisciplined invention, illiterate originality, or, indeed, upon any audacity of ignorance.

It was further agreed by the architects of the court that the module of proportion for the composition of their façades should be a bay not exceeding twenty-five feet in width and sixty feet in height to the top of the main cornice, which is about the size of a five-storied

façade on an ordinary city lot. In all other respects each of these gentlemen, influenced of course by mutual criticism, and subject to the approval of the executive of the Exposition through its Committee on Grounds and Buildings, has been left perfectly free to develop, within the area prescribed in each case, the design of the building assigned to him, according to his own convictions as to general outlines and details of architectural expression. Under these circumstances, therefore, it may fairly be anticipated that the great palaces of the court will illustrate the vital principle of unity in variety on a scale never before attempted in modern times.

It must be borne in mind, however, that all this is not architecture in its highest sense, but rather a scenic display of architecture, composed (to use a theatrical term) of "practicable" models, executed on a colossal stage, and with a degree of apparent pomp and splendor which, if set forth in marbles and bronze, might recall the era of Augustus or Nero. We have not, it is true, the inexhaustible resources of the museums and schools and gardens of Paris to people this great industrial court with statues and vases, set against rich backgrounds of exotic foliage; but the opportunity will possibly enable us to prove that whatever characteristics of audacious invention or adaptation are exhibited in the best buildings of modern America, it is not because our architects are untrained in the organization of structural forms, ignorant of historical precedent, or wanting in respect for the works of the masters, nor yet because they do not know how on occasion to express themselves in the language of the most venerable traditions of art. But these great Doric, Ionic, Corinthian, and Composite orders, with their arches, porticos, pavilions, attics, domes, and campaniles, do not express actual structure in any sense, as was the case with Paxton's apotheosis of the greenhouse in the great glass and iron building of the first London Exposition; they rather serve as architectural screens, of which only the main divisions and articulations have been suggested by the temporary framework of iron and timber which they mask, and which, in itself, is incapable of expression in any terms of monumental dignity. If each architect of the board had been permitted or encouraged to make his especial screen an unrestricted exhibition of his archaeological knowledge or ingenuity in design, we should have had a curious, and in some respects perhaps an interesting and instructive, polyglot or confusion of tongues, such as in the early scriptural times on the plains of Shinar was so detrimental to architectural success. The show might have contained some elements of the great "American Style"; but as a whole it would have been

a hazardous experiment, and it certainly would have perplexed the critics. In respect to the architecture of the great court, therefore, it seemed at least safer to proceed according to established formulas, and to let the special use and object of each building, and the personal equation of the architect employed on it, do what they properly could, within these limits, to secure variety and movement.

It is a fashion of the times, following Mr. Ruskin, to stigmatize the marvelous multiplication of mechanical appliances to life in the nineteenth century as degrading to its higher civilization and destructive of its art. Mr. Frederic Harrison agrees with these philosophers of discontent so far as to say that if machinery were really the last word of the century we should all be rushing violently down a steep place, like the herd of swine. But he says:

To decry steam and electricity, inventions and products, is hardly more foolish than to deny the price which civilization itself has to pay for the use of them. There are forces at work now, forces more unwearied than steam, and brighter than the electric arc, to rehumanize the dehumanized members of society; to assert the old, immutable truths; forces yearning for rest, grace, and harmony; rallying all that is organic in men's social nature, and proclaiming the value of spiritual life over material life.

In order, therefore, to present a complete and symmetrical picture of modern civilization, it is necessary that the Columbian Exposition should not only bring together evidences of the amazing material productiveness which, within the century, has effected a complete transformation in the external aspects of life, but should force into equal prominence, if possible, corresponding evidences that the finer instincts of humanity have not suffered complete eclipse in this grosser prosperity, and that, in this headlong race, art has not been left entirely behind. The management of the Exposition is justified in placing machinery, agricultural appliances and products, manufactures and the liberal arts, the wonderful industrial results of scientific investigation, and the other evidences of practical progress, in the midst of a parallel display shaped entirely by sentiment and appealing to a fundamentally different set of emotions. It is the high function of architecture not only to adorn this triumph of materialism, but to condone, explain, and supplement it, so that some elements of "sweetness and light" may be brought forward to counterbalance the boastful Philistinism of our times. Each department of the Exposition must possess more or less capacity for architectural expression, if not by disposition of masses, by style, or by sympathetic treatment of technical detail, at least by the

suggestions of sculpture and characteristic decoration. It is true that the vast preponderance of human effort in these closing years of the century has been in favor of practical things; it remains to be seen whether this supreme test of the elastic powers of architecture to develop out of these practical things demonstrations of

INTERIOR OF ADMINISTRATION BUILDING.

art will result in furnishing any of that "rest, grace, and harmony" which are needed as a compensation for materialism.

By a remarkable piece of fortune, the architects to whom the five buildings on the great court were assigned constituted a family, by reason of long-established personal relations and of unusually close professional sympathies. Of this family Mr. Hunt was the natural head; two of its members, Post and Van Brunt, were his professional children; Howe, Peabody, and Stearns, having been pupils and assistants of the latter, may be considered the grandchildren of the household; while McKim, who had been brought up under the same academical influences, was, with his partners, of the same blood by right of adoption and practice. Collaboration under such circumstances, and under a species of parental discipline so inspiring, so vigorous, and so affectionate, should hardly

fail to confer upon the work resulting from it some portion of the delightful harmony which prevailed in their councils.

By common consent the most monumental of these buildings—that devoted to the Administration—was undertaken by Mr. Hunt. Having all the elements of an academical project of the first class, it was eminently fitting that this important structure should fall into hands so admirably equipped by learning and experience to do it full justice. It was to occupy the western or landward side of the great court, and to stand in its main central axis at the point where this axis was intersected by a transverse axis which ran north and south between the Mines and Electricity buildings. It was designed to be the loftiest and most purely monumental composition in the Park, and to serve not only for the accommodation of the various bureaus of administration, but, more conspicuously, as the great porch of the Exposition. The area assigned was a square measuring about 260 feet on each side, and it was necessary to divide it into four equal parts by two great avenues crossing at right angles on the axial lines which we have described. In fact, the building was in some way to stand on four legs astride this crossing of the ways, like one of the quadrilateral Janus-coaches of the Romans, but on a much greater scale. The whole system of railway communication was to be so connected on the west with this building, that the crowds of visitors, on arriving, should enter and cross this ceremonial vestibule; should there obtain their first impressions; and by the majesty and spacious repose of the interior, should be in a manner introduced into a new world, and forced into sympathy with the highest objects of this latest international exposition of arts. Its function, indeed, was that of an overture.

These conditions suggested to Mr. Hunt the idea of a civic temple based upon the model of the domical cathedrals of the Renaissance. Following this type, he projected, upon the crossing of the two axial lines, a hall of octagonal plan; but unlike the cathedrals, this hall was designed to form the fundamental basis, the leading motive, of the design, not only on the interior but on the exterior of the structure, there being neither nave nor transepts to interfere with the clear external development of this dominating feature from the ground to the summit. Thus, at the outset, he secured that expression of unity which is essential to the noblest monumental effect in architecture. The expression of repose, at once majestic and graceful, which is no less essential, was to be obtained, not only by a careful subordination of detail to the leading idea, but by such a disposition of masses as would impart an aspect

DRAWN BY E. ELDON DEANE.

ADMINISTRATION BUILDING.

RICHARD M. HUNT, ARCHITECT.

of absolute stability. This implied the necessity of procuring a pyramidal or culminating effect; the whole composition, from bottom to top, preparing for this effect by some process of diminution by stages upward. To this end he enveloped his hall (which the conditions of area permitted him to make 120 feet in interior diameter) with two octagonal shells about 24 feet apart, the space between being occupied by galleries, elevators, vestibules, and staircases. Against the alternate or diagonal sides of the octagon he erected four pavilions in the form of wings 84 feet square, in four stories, in which

he accommodated the various offices of administration; the archways, pierced through the four cardinal sides of the octagon, being externally recessed between these pavilions, thus affording two direct, broad passageways through the building at right angles. These pavilions are so treated as to be in scale with the other buildings of the great court, and are carried to the same height of 60 feet, thus securing four wide-spreading abutments with flat, terraced roofs. Above these the outer octagonal shell of the central mass detaches itself, and asserts its outline against the sky through another stage, where it

stops in the form of a gallery, decorated with bronze flambeaux, and permits the inner shell in turn to become outwardly manifest in a third stage of diminished diameter, rising in an octagonal drum, the whole mass finishing with the soaring lines of the central dome; which by vertical growth, determined by conditions of proportion, reaches the height of 275 feet from the pavement. Enriched with decorated ribs and sculptured panels, and made splendid with shining gold, this noble dome rises far above the other structures of the Exposition, proclaiming afar the position of its monumental gateway.

But as the inner surface of the outer dome would form a ceiling far too lofty to serve as a proper and effective cover for the hall, it became necessary, in order to give proper proportions to this monumental chamber, to construct an inner and lower dome, 190 feet high from the pavement, with an open eye at the apex, through which from below could be seen the upper structure, like the cope of a mysterious sky beyond. This architectural device is similar to those used by Mansart in the dome of the Invalides at Paris, by Soufflot in the Panthéon, and by Wren in St. Paul's at London, which rank next to St. Peter's as the largest and most important of the great Renaissance temples of Europe. It also appears in the rotunda of the national Capitol at Washington. But, as conceived by Hunt, the exterior dome of the vestibule of the Exposition is 42 feet higher than that of Mansart, 45 feet higher than that of Soufflot, about the same height as that of St. Paul's, and 57 feet higher than that of our national Capitol, exclusive of the lantern in each case. The interior dome has a height from the pavement 15 feet higher than that of the Invalides; it has about the same height as that of the French Panthéon; is 20 feet lower than that of St. Paul's, and 10 feet higher than that of the Capitol at Washington. In diameter it surpasses all these domes, being 38 feet wider than the first, 56 feet wider than the second, 12 feet wider than the third, and 26 feet wider than the Washington example. Indeed, in this regard, it is only 20 feet less than that of St. Peter's at Rome, which, however, in exterior height exceeds the American model by 90 feet, and in interior height by 143. Being thus in dimensions inferior only to the work of Michelangelo, it may be considered, in this respect, at least, an adequate vestibule to the Exposition of 1893.

The method of lighting the interior of this vast domical chamber in a proper and adequate manner was a problem so important that Mr. Hunt considered it one of the primary formative influences controlling the evolution of his architectural scheme. One of the noblest effects of interior illumination known in historical art is in the Roman Pantheon, the area of

which (140 feet in diameter) is lighted only by the circular hypethral opening 25 feet wide at the apex of the dome, 140 feet from the pavement. Inspired by this majestic example, Mr. Hunt proposed in this respect to depend mainly upon such light as could be obtained from the open eye of his lower dome, 50 feet wide and 190 feet from the pavement, which should in turn borrow its light from the illumination of the space between his outer and inner domes through a glazed hypethral opening 38 feet wide, forming the summit of the building, and taking the place of the lantern or belvedere which usually forms the finial of the greater domes of the Renaissance.

In his decorative treatment of the problem thus evolved Mr. Hunt has exercised a fine spirit of scholarly reserve. The architectural language employed is simple and stately, and the composition as a whole is so free from complications, its structural articulations are so frankly accentuated, that it is easy to read, and, being read, cannot fail to surprise the most unaccustomed mind with a distinct and veritable architectural impression. But to obtain this simplicity of result a far greater knowledge of design and far more ingenuity of adaptation have been required than if the building had been sophisticated with all the consciousness and affectations of modern art. In order to bring his design into the family of which, by the adoption of a common module of proportion, the other buildings of the groups around the great court are members, Mr. Hunt's four pavilions of administration, forming the lower story of the façades, are treated externally, like them, with a single order raised upon a basement. He has preferred the Doric in his case, so as to obtain by contrast with its neighbors an effect of severe dignity and what might be called colossal repose, and to provide for a gradual increase of enrichment in the upper parts of his monument. His second story is Ionic, with an open colonnade, or loggia, on each of the cardinal faces of the octagon, showing the inner shell behind, and with domed circular staircase pavilions of the same order on the narrower alternate sides, niched between heavy corner piers, which bear groups of statuary, thus obtaining a certain degree of movement and complication in the outlines of his design, and enhancing its pyramidal effect. On all his exterior he has used conventional ornament with great reserve, depending for richness of effect upon three colossal groups of statuary on each of his administrative pavilions, upon two, flanking each of his main entrances, and upon eight, crowning the gallery below the drum of his dome.

This sculpture, the work of Mr. Karl Bitter of New York, is characterized by great breadth

GROUP FOR ADMINISTRATION BUILDING, "GLORIFICATION OF WAR."

and dignity of treatment, and by that expression of heroic power and fitness which is derived from knowing how to treat colossal subjects in a colossal way, and how to model figures so that they may assist the main architectural thought and not compete with it. Thus the groups which crown the corner piers of the four wings in the lower part of the building are in repose, and are so massed that they serve properly as monumental finials, while those surmounting the gallery above are more strongly accentuated, so as to become intelligible at that great height, and are distinguished by a far greater animation of outline and lightness of movement, by means of gesture, outspread wings, and accessories, so that they may act

as foils to the simple and stately architectural lines of the dome, at the base of which they stand, and so that they may aid it in its upward spring. The subjects are apparently intended to typify, in a succession of groups, beginning in the lower parts of the monument, the advance of mankind from barbarism to civilization, and the final triumph of the arts of peace and war.

Unlike the other buildings of the Exposition, Mr. Hunt's has two sets of façades, an exterior and an interior. In the latter he has not repeated his exterior orders, and the same self-denial which has chastened and purified the exterior has left these inner walls large, simple, and spacious, not even the angles of the inclos-

ing octagon being architecturally emphasized at any point. Each of the eight sides of this interior octagon is pierced with an archway occupied by a screen of doors below and bronze grilles above; over these is a series of panels filled with sculpture and inscriptions, and upon the great interior cornice which crowns these walls is a balcony, like the whispering-gallery of St. Paul's, by means of which the scene may be viewed from above. An order of pilasters directly under the inner dome crowns this gallery, and the dome itself is decorated with panels, the whole interior being enriched with color, so disposed as to complete and perfect the design.

We have already said that this vestibule was intended to introduce the visitors to the Exposition into a new world. As they emerge from its east archway and enter the court, they must, if possible, receive a memorable impression of architectural harmony on a vast scale. To this end the forums, basilicas, and baths of the Roman Empire, the villas and gardens of the princes of the Italian Renaissance, the royal courtyards of the palaces of France and Spain, must yield to the architects, "in that new world which is the old," their rich inheritance of ordered beauty, to make possible the creation of a bright picture of civic splendor such as this great function of modern civilization would seem to require.

At the outset it was considered of the first importance that the people, in circulating around the court and entering or leaving the buildings, should so far as possible be protected from the heat of the midsummer sun. To assist in accomplishing this object the great quadrangle will be closed in by a series of sheltered ambulatories, like the Greek *stoa*, included in and forming a part of the façades of the palaces of Machinery and Agriculture on the right, and of the Liberal Arts and Electricity on the left. The vast fronts of these buildings, far exceeding in dimensions those of any other ancient or modern architectural group, with their monumental colonnaded pavilions, their sculptured enrichments, their statuary, domes, and towers, will appear in mellowed ivory marble, relieved by decorations in color in the shadowy recesses of the porticos. Immediately before him the stranger will behold the great basin 350 feet wide and 100 feet long, stretching eastward in the middle of the court, bordered with double walled terraces, of which the lower will be decorated with shrubbery and flowers, and the upper, with balustrades, rostral columns, vases, and statuary. Broad stairs descend from the main porticos of the buildings to the water, and the canals, which enter the basin on each side, are crossed by monumental bridges. On the nearer margin of the greater basin, and in the

axis of the court, he will see a smaller circular basin 150 feet in diameter, on a level with the upper terrace, flanked by two lofty columns bearing eagles. In the center of this, on an antique galley of bronze 60 feet long, eight colossal rowers, portraying the Arts and Sciences, stand, four on a side, bending to their long sweeps; in the prow is poised the herald Fame, with trump and outspread wings; while aft, Time, the pilot, leans upon his helm; and, high aloft on a throne, supported by cherubs, Columbia sits, a fair, youthful figure, eager and alert, not reposing upon the past, but poised in high expectation. Eight couriers precede the barge, mounted upon marine horses ramping out of the water. The whole triumphal pageant is seen through a mist of interlacing fountain-jets, and from the brimming basin the water falls 14 feet in a series of steps into the greater sheet below, a half-circle of dolphins spouting over the cascade. This pompous allegory is the work of the sculptor Frederick MacMonnies. At the outer end of the basin a colossus of the Republic, by the sculptor Daniel C. French, rises from the water. It is treated somewhat in the Greek archaic manner, with a strong accentuation of vertical lines, but with a simplicity and breadth which give to the figure an aspect of majesty and power. Beyond it, a double open colonnade, or peristyle, 60 feet high, like that of Bernini in front of St. Peter's, forming three sides of a square, closes in the great court toward the lake. Of the two wings of this colonnade one is a concert-hall, and the other a casino or waiting-hall for passengers by boat. Its columns typify the States of the Union. In the center of this architectural screen is a triumphal arch thrown over the canal which connects the basin with the harbor. Through this and through the open screen of the colonnade one may see the wide-spreading lake, the watery horizon, and, still in the axis of the court and a thousand feet from the shore, a lofty pharos with an island-casino at its base. Animating the whole, banners and gonfalons flutter gaily from innumerable staffs; people of all nations walk in the shadow of the porches, linger on the bridges, crowd along the broad pavement of the terraces, and watch from the balustrades the incessant movement of many-colored boats and electric barges upon the water.

THE palace of Mechanic Arts, or, as it may be better known, Machinery Hall, occupies a frontage of 842 feet on the south side of the court, and a depth of 500 feet, thus covering, with the main building of this department, 9½ acres. These dimensions are nearly the same as those of the palace of Diocletian at Spalatro, and larger than the Parliament House of Great Britain in the proportion of 5 to 2. (The Capitol

DRAWN BY JULIUS ROLSHOVEN.

STATUE OF "THE REPUBLIC," BY DANIEL C. FRENCH.

at Washington measures 680 feet by 280.) Attached to this building on the west is an annex 550 feet long, covering about  $6\frac{1}{4}$  additional acres, for the exhibition of the rougher sorts of machinery. Messrs. Peabody and Stearns of Boston, in adjusting the constructional scheme of their main building to this fixed area, were governed by the necessity of providing large unencumbered spaces of considerable height for exhibits, so disposed as to facilitate classification and to avoid confusion; and by the fact, imposed equally upon all the other architects, that, so far as possible, the form of structure should be such that its material would be marketable after the conclusion of the Fair. These considerations led to the adoption of a typical railway-shed 130 feet wide, covered by a barrel-shaped roof 100 feet high, sup-

ported on iron arched trusses 50 feet apart, as a convenient basis for their plan. They placed three of these sheds side by side. But the site of the building was such that its main entrance had to be placed in the center of the long court-frontage, opposite the south doorway of the great vestibule of the Exposition, thus establishing a clear architectural relationship with its nearest and most important neighbor. This condition suggested the crossing of the triple hall in the center by a great transept, which, being of the same width as each of the three naves, developed a noble main hall composed of three bays 130 feet square, from each of which, to the right and left, the naves opened in long perspectives of six 50-foot bays on each side. In order still further to distinguish this main avenue, giving access to these minor naves, each of its three square divisions was covered with a conical glazed roof, giving an interior effect of a succession of domes. The architects thus secured a vast covered area composed of three parallel naves with glazed roofs, crossed by a central main transept, the combination giving a total width of 390 feet and a length of 730, affording every desirable condition of practical convenience, with structural divisions so

clear, large, and simple as, in great measure, to counterbalance, with their effect of spacious harmony and noble proportion, the inevitable perplexity and confusion of a display of miscellaneous running machinery.

In this way Messrs. Peabody and Stearns proposed to satisfy the principal structural and practical requirements of their problem. But the more difficult task remained to give to the prosaic and unimaginative mass an exterior aspect of beauty and fitness, which, so far as possible, should reconcile the spirit of materialism, here, in the very central place of its power, with the spirit of organized "rest, grace, and harmony." The architectural formulas by which this new and apparently ill-assorted marriage of Hephæstus and Aphrodite was to be attempted had already been established, as we have seen,

ported on iron arched trusses 50 feet apart, as a convenient basis for their plan. They placed three of these sheds side by side. But the site of the building was such that its main entrance had to be placed in the center of the long court-frontage, opposite the south doorway of the great vestibule of the Exposition, thus establishing a clear architectural relationship with its nearest and most important neighbor. This condition suggested the crossing of the triple hall in the center by a great transept, which, being of the same width as each of the three naves, developed a noble main hall composed of three bays 130 feet square, from each of which, to the right and left, the naves opened in long perspectives of six 50-foot bays on each side. In order still further to distinguish this main avenue, giving access to these minor naves, each of its three square divisions was covered with a conical glazed roof, giving an interior effect of a succession of domes. The architects thus secured a vast covered area composed of three parallel naves with glazed roofs, crossed by a central main transept, the combination giving a total width of 390 feet and a length of 730, affording every desirable condition of practical convenience, with structural divisions so

by the agreement among the architects of the court to confine themselves to a style strictly classic, and to a definite height of 60 feet to the cornice. By this limitation of effort they proposed to secure for the great quadrangle a harmonious aspect of stately ceremony; but in so doing they sacrificed invention to convention, and were constrained, in designing their exteriors, to confine themselves to the composition of a series of architectural masks or screens, as we have already explained. These, though in general arrangement suggested by the divisions of the plan in each case and by the uses of the building, were intended to be expressive rather of possible than actual structure. In fact, so far as the exterior envelop was concerned, they were to be merely plastic models of buildings, designed so as to be capable of construction in permanent materials. The whole, therefore, may be considered as little more than a pageant of practicable stage scenery on a vast scale. The architects of Machinery Hall, in studying the problem of their architectural screen, reserved for this purpose an enveloping area, about 50 feet wide, extending entirely around their central hall. This area they occupied with external

MACHINERY HALL.

spacing of these columns being multiples of the structural divisions of the great interior bays. Unlike the famous Paris example, however, the basement upon which these colonnades are placed is pierced with an open arcade to form the lower ambulatory, the ceiling of the latter being treated with a dome in each bay, and that of the former with richly embellished panels. To relieve the scrupulously scholastic accuracy of the main order, and to recall the days of Columbus and of Ferdinand and Isabella, the apertures in the rear walls of the upper porticos are treated with the picturesque freedom of the Spanish Renaissance, and the arms of Spain and the portrait of Columbus are frequently repeated about them.

It became evident to the architects, in the evolution of their design, that the light and open character of these long two-storied porticos needed some strongly contrasting form of relief and support, to be obtained by transition to an expression of solidity and massiveness in the corner and middle pavilions. For this reason they were led to treat the latter very boldly as plain wall-surfaces abruptly interrupting all the horizontal lines of the orders of the curtain-walls, and carried 35 feet higher, there finishing with a level cornice. On each front this plain wall-surface they divided in three pavilions, of which the outer, 29 feet wide, are treated as towers, the wider intermediate part being slightly recessed between them. Upon these towers, which contain staircases, they placed open octagonal lanterns, in three diminishing stories, rising to the height of 102 feet, like spires enriched with balustrades and finials, somewhat Romantic in character, and following suggestions contained in Spanish or Mexican examples. On the north pavilion toward the court, and opposite the south entrance of the Administration Building, the architects embedded in this central division a temple-like portico 75 feet wide and 90 feet deep, the portion developed outside the pavilion, and forming the exterior, being apsidal or semicircular in plan. This portico they treated with a colossal Corinthian order 60 feet high, crowning the apsidal projection with a low half-dome behind a balustrade, with a pedestal and statue over each column somewhat like the

and internal galleries of two stories. These galleries naturally develop pavilions 50 feet square where they intersect at the corners, and they are interrupted, in the center of the two principal façades, by main-entrance pavilions; that on the north facing the Administration Building, and that on the east facing the corresponding side porch of the Agricultural Building. It has already been noted that the architects of the court considered that it was necessary to establish sheltered ambulatories along their fronts. In accordance with this agreement, the long intermediate stretches of façade or curtain-walls of this building, between the pavilions, are faced with porticos; but in this case the porticos are arranged in two stories to correspond with the interior, treated somewhat after the manner of Claude Perrault in the east front of the Louvre, each division having Corinthian colonnades of 23 columns 27½ feet high on the long façades, and of 9 columns on the end façades, the

DESIGNED BY MAX BACHMANN,  
FIGURE IN WINDOW-FRAME OF  
MACHINERY HALL.

famous circular porch of the *calidarium* in the Baths of Caracalla. The east portico practically received the same treatment, the temple-por-tico, however, in this case being 75 feet square in plan, two fifths of it projecting outside the pavilion and finishing with a pediment, and the remainder being embedded, as it were, in the interior. It would be difficult to conceive of a more majestic welcome to this department of the Exposition. With the object of keeping the corner pavilions subordinate to those in the center, and to establish unity of design on the adjacent sides, the two-storied orders of the long colonnades are continued around them, but emphasized by a slightly projecting loggia on each face. The interior of each of these pavilions contains a grand double staircase inclosed in a circular cage of columns supporting a dome. This domical treatment is expressed externally by a much higher dome, raised upon a circular arcaded drum or podium supported on the corners by small circular pavilions and finishing with a lantern.

The long level sky-lines of these great façades, thus broadly accentuated at the corners by domes, and in the center by the aspiring lines of twin towers nearly 200 feet high, were devised to form an engrossing foreground to the long higher roofs of the triple naves behind, broken by masses of decorative skylights with clearstories, and by the three low conical roofs of the main central transept. On the shorter fronts these naves present their glazed circular ends behind and above the façade in the manner used in the great Roman baths. In this way every principal feature of the main structure is made to play a noble and expressive part in the decorative scheme. The details of this design have been kept in rigid conformity with classical and scholarly traditions, relieved, as we have

seen, in parts by motives suggested by the highly ornate Renaissance of Spain. Enriched profusely with sculpture and emblematic statues, and with effects of decorative color behind the open screen of the porticos, this composition, if it does not succeed in revealing the mysterious relationships between machinery and art, may at least stand as a beautiful model of highly organized academic design adjusted to modern uses.

The iconographic scheme of this building embraces statues representing the Sciences and the Elements, and figures bearing escutcheons inscribed with the names of famous inventors. In the great east pediment Chicago presents to America, and to the judges of the nations, various inventors and mechanics submitting their handiwork. The windows are surmounted by groups of infants bearing mechanical tools, and holding festoons composed of chains of mechanical implements instead of the conventional fruit and flowers.

Before proceeding to the consideration of the Agricultural Building, which lies east of Machinery Hall, and, with its noble façade, completes the southern closure of the great court, it is necessary to consider the treatment of the minor court, which, with the southern extension of the main canal from the basin, lies between these two buildings. The terraces in front of them are connected by a bridge thrown across the canal, and the southern closure of this minor court forms a connecting link of two-storied corridors between the two buildings, solid below and open above, and repeats the orders of the curtain-walls of the Machinery Building, which, in their turn, are not unlike those of the façade of the Museo of Madrid. This light construction is flanked at each end by a solid pavilion, still of marked Spanish accent,

DRAWN BY C. HOWARD WALKER.

PEABODY &amp; STEARNS, ARCHITECTS.

THE CONNECTING SCREEN OF CORRIDORS BETWEEN THE MACHINERY AND AGRICULTURAL BUILDINGS.

without pilasters, and treated as a wing of the main building. One of these pavilions is designed for a restaurant, and the other for a hall of assembly. The transition from these to the delicate open peristyle of the connecting corridors is still further eased by the interposition of small towers, crowned by circular belvederes, which break the sky-line with great elegance. This screen, while making a noble connecting-link between the two buildings, serves as a frontage for the amphitheater and offices of the Live-Stock Exhibit, which will be designed by Messrs. Holabird and Roche of Chicago, and which are entered by a triumphal arch in

the center of the screen. The southern end of this canal will be decorated by a fountain with spouting lions and an obelisk.

All the architectural modeling of this building is executed by John Evans & Co. of Boston, and the figures in connection with it are modeled, under their direction, by Mr. Bachmann. The statues of the Sciences and the Elements, and the groups on the entrance to the Live-Stock Exhibit, are the work of the sculptor Waagen. The statues on the semicircular north porch, and the figures in the spandrels over the entrance to the Live-Stock Exhibit, are executed by Mr. Krauss.

*Henry Van Brunt.*

## HAST THOU HEARD THE NIGHTINGALE?

### I.

YES, I have heard the nightingale.  
 As in dark woods I wandered,  
 And dreamed and pondered,  
 A voice passed by all fire  
 And passion and desire ;  
 I rather felt than heard  
 The song of that lone bird :  
 Yes, I have heard the nightingale.

### II.

Yes, I have heard the nightingale.  
 I heard it, and I followed ;  
 The warm night swallowed  
 This soul and body of mine,  
 As burning thirst takes wine,  
 While on and on I pressed  
 Close to that singing breast :  
 Yes, I have heard the nightingale.

### III.

Yes, I have heard the nightingale.  
 Well doth each throbbing ember  
 The flame remember ;  
 And I—how quick that sound  
 Turned drops from a deep wound !  
 How this heart was the thorn  
 Which pierced that breast forlorn !  
 Yes, I have heard the nightingale.

*R. W. Gilder.*

THE FLAGELLANTS (DETAIL), BY CARL MARR.

ENGRAVED BY HENRY WOLF.

## AMERICAN ARTIST SERIES.

CARL MARR, J. H. DOLPH, AND HERBERT ADAMS.

DRAWN BY W. L. DODGE, FROM A PHOTOGRAPH.

OUTLINE OF "THE FLAGELLANTS," BY CARL MARR.

### "THE FLAGELLANTS," BY CARL MARR.

**P**ERHAPS no picture was ever placed with better effect than Carl Marr's "The Flagellants" in the Munich Exhibition of 1889. Entering the building from the street, one passed through a vestibule which by the aid of Eastern rugs and other textiles had been converted into a mass of soft, richly subdued harmonies. From the vestibule one entered a room whose screened skylight diffused a twilight effect on groups of palms and other exotics. From this dimly lighted apartment a door perhaps eight or ten feet wide gave entrance to the picture-gallery, and on the wall opposite, filling the entire opening of the doorway, was the picture. The contrast of the well-lighted gallery with the subdued light through which one had to pass, the fact that "The Flagellants" was not only the first to catch the eye, but the only picture that could be seen until one had advanced some distance into the antechamber, together with the light key of the picture, gave the effect of looking out of a window on the self-tortured,

fanatical wretches who, scourge in hand, led by the hermit Rainier, overran Italy in the thirteenth century. So strong was the illusion, so intensified by the picture's realism, that it required only a slight exaltation of the senses to hear the hiss of the scourge as it fell on the lacerated and bleeding back of the devotee, the praying, the groaning, and the weeping. It was certainly no small honor to the picture to place it thus in an exhibition which represented not only the best of German, but also much of the best of French, art. But it was, together with the gold medal awarded the painting, an honor which was well deserved. An excellent composition containing over two hundred figures, all well drawn; a story requiring much historical research, well told, although not without some warrantable artistic license; stirring and dramatic action without a suggestion of the stage; the whole, if not vigorously, at least well painted—the artist had produced in this work a picture which in its technical qualities easily took rank with the average in the exhibition, and in its quality of invention stood almost alone.

At the date of this exhibition Carl Marr was thirty years of age. Early in his teens he had

gladly left school to learn wood-engraving in his father's office, for a serious defect in his hearing had made him a lonely boy and a dull scholar. His father seems to have early recognized that the lad was cut out for an artist, and, when he was eighteen, sent him to Germany to study. After spending a year at Weimar, he went to Berlin to work under Professor Gusson; from Berlin he went to Munich, where he became a pupil of Seitz, and, later, of Gabriel Max. While with the last named he painted the "Mystery of Life," one of his two pictures now in the Metropolitan Museum of Art.

In 1880, considering himself fairly equipped, he returned to his native town, Milwaukee, with this picture as the key to unlock the door of the temple of fame. A very few months disillusioned him. Nobody wanted the picture. There was no resource for him in engraving, and had it not been for his ability as a pianist, his career, artistic and other, would in all probability have come to an end at that time. At the expiration of eighteen months of precarious existence he secured from Boston and New York publishers enough illustrating to enable him, by careful economy, after five months, once more accompanied by the "Mystery of Life," to cross the ocean. Soon after his return to Munich he painted his "Episode of 1813," and with it scored his first success, the picture being purchased by the (German) Society of Historical Art. In 1885 he began work on "The Flagellants," and finished it in 1889. It won a gold medal. One year later he produced "1806 in Germany," now in the Royal Gallery at Königsberg, and for which he was awarded by the Royal Academy of Berlin another gold medal. As was to be expected from the influence of the masters under whom he has studied, Carl Marr's work is intellectual, serious, and thoughtful. His pictures are the work of a faithful and diligent student, of one who takes life seriously. His work, which possesses imagination and invention, excellent drawing, composition, construction, and masterful story-telling, has fairly won for him the recognition he has received.

"AN AFTER-DINNER NAP," BY J. H. DOLPH.

CARL MARR has been more fortunate in his environment than has J. H. Dolph. He also, while a mere boy, made his hands minister to his necessities in a field other than that of fine art. Born in 1835 on a farm in the interior of New York State, by the death of his parents he was left to shift for himself when only ten years of age. From that time until he went abroad in 1870 he had a very varied experience: at first as a painter of ornamental cards, later as a scene-painter, and, in a very broad sense, as

a marine painter also, for he is fond of telling that on one occasion he painted on the stern of a schooner a composition, "Agriculture and Commerce," that was nearly thirty feet wide.

By 1860 he had made a reputation as a painter of easel-pictures, and in 1870 had saved enough money to pay for a course of study abroad. He entered in Antwerp the studio of an animal-painter of some celebrity, Louis Van Kuyck, where he worked for two years, and then returned to America. His is also a story of disappointment upon his return home. His *penchant* was for scenes of country life, the barn-yard, the country blacksmith shop, etc. These subjects he painted well, but the public would not buy them. When his resources were almost exhausted, a picture of a kitten, a studio pet, found a ready purchaser at a fair price, and from that time his success in this *genre* has been such that he rarely paints any other class of subject, and the knowledge that he is a good portrait- and figure-painter is confined almost to his brother artists and intimates. It is hardly to be wondered at that Mr. Dolph should be kept painting puppies and kittens, he paints them so well, as is shown in his picture on page 64; his knowledge of their construction, of their action, of their ways is so intimate; there is so much "cattiness" in his cats, that one must like them.

PORTRAIT BUST, BY HERBERT ADAMS.

IT seems necessary in art to discriminate between the imaginative and the inventive, between the poetical and the tentative. An artwork may possess much invention, and yet lack imagination; may possess this latter quality, and yet no invention. Thus a work by Watts possesses imagination; one by Doré, invention. Many a so-called poetic work is poetic simply because the power to execute is lacking. The thought that projected the work may have been commonplace and literal enough, but the lack of technical ability on the part of the worker left it vague and illusive. The thought that inspired Watts's "Love and Death" was poetic. The execution embodied the thought. The thought was a dream. Had the execution been bold and vigorous, the vigor of the technic would have robbed the dream of its poetry.

Mr. Herbert Adams seems to understand these distinctions, and to have combined happily the imaginative, inventive, and technical in the marble reproduction of which is printed on page 121. This bust is quite in the spirit of the Renaissance, and yet is thoroughly modern. There is such a sweet, womanly, simple grace in it; such a real unreality; such thoroughly good modeling and construction, with a conscious letting go of convention when the strength of

the technic would say too much, would make too personal the personality, that in looking at it one instinctively thinks of that other in the Louvre, the delight of the artist, the despair of the copyist, and the puzzle of the Philistine, "La Femme Inconnue."

Mr. Adams was born in Concord, Vermont, in 1859. His first lessons in art were taken at the Massachusetts Normal Art School, where, as student and teacher, he passed several years.

In 1885 he went to Paris, where his serious art study began under Antonin Mercié. He remained in Paris six years, exhibiting in each successive Salon, and in 1888 he received a mention. He returned to America two-years ago, and at present is connected with the Pratt Institute, Brooklyn. His most important work is the public fountain at Fitchburg, Massachusetts, a group in bronze, larger than life, cast by the *cire perdue* process.

W. Lewis Fraser.

ALTAR AND IDOL.

FATHERS of Freedom, o'er  
The realm your courage won,  
Carrion vultures soar,  
And deeds of shame are done.

The altar, raised to your  
God, in the wilderness,  
Is stained by priests impure,  
Who alien gods profess.

Speak, departed ones,  
From your graves by the sea!  
Have ye left no sons  
Stern and pure as ye?

Sleep ye so sound  
As not to hear the cry  
Of Freedom, flouted, bound,  
Target of mockery?

Shall we, taught to obey  
No lord save only God,  
Bend 'neath the huckster's sway—  
Cringe at the gambler's nod?

Twice our blood we shed  
That slaves might cease to be:  
Must we ourselves be made  
Slaves, who slaves made free?

Fetters that control  
Limbs alone are light:  
Fetters of the soul—  
Who may gage their weight!

God of our fathers, smite  
Our golden idols down!  
Kindle the sacred light!  
Give Freedom back her own!

That we once more may rise  
The beacon of mankind—  
Not grope with darkened eyes,  
Blind leaders of the blind!

Julian Hawthorne.

## POEMS BY HERMAN MELVILLE.

[THE death of Herman Melville, which took place in New York soon after midnight on the morning of September 28, 1891, was the signal for an outpouring of articles on the life and writings of an author whose vogue had temporarily subsided, partly through his own self-seclusion. Melville has rightly been called the pioneer of South Sea romance, and his "Typee" and "Omoo" gained an international reputation at an earlier date than the writings of Lowell, although both authors were born in the same year — 1819. These books, with "Moby-Dick; or, the White Whale," soon became classics of American literature, and are likely to remain such. They have been continuously in print in England, and new American editions are now in course of publication. Melville's art of casting a glamour over scenes and incidents in the South Pacific, witnessed and experienced by himself, has not been exceeded even by Pierre Loti. The Civil War first turned his attention to lyrical writing, and many of his "Battle-Pieces and Aspects of the War" (1866) obtained a wide circulation. Near the close of his life he had printed for private distribution a few copies of two little books of miscellaneous poems, the last fruit off an old tree, entitled "John Marr and Other Sailors" and "Timoleon." From these volumes the following pieces have been selected.

ARTHUR STEDMAN.]

### ART.

IN placid hours well pleased we dream  
Of many a brave, unbodied scheme;  
But form to lend, pulsed life create,  
What unlike things must meet and mate:  
A flame to melt, a wind to freeze;  
Sad patience, joyous energies;  
Humility, yet pride and scorn;  
Instinct and study; love and hate;  
Audacity, reverence. These must mate  
And fuse with Jacob's mystic heart,  
To wrestle with the angel — Art.

### MONODY.

TO have known him, to have loved him,  
After loneliness long;  
And then to be estranged in life,  
And neither in the wrong;  
And now for Death to set his seal —  
Ease me, a little ease, my song!

By wintry hills his hermit-mound  
The sheeted snow-drifts drape,  
And houseless there the snowbird flits  
Beneath the fir-trees' crape:  
Glazed now with ice the cloistral vine  
That hid the shyest grape.

### THE NIGHT-MARCH.

WITH banners furled, and clarions mute,  
An army passes in the night;  
And beaming spears and helms salute  
The dark with bright.

In silence deep the legions stream,  
With open ranks, in order true;  
Over boundless plains they stream and gleam —  
No chief in view!

Afar in twinkling distance lost  
(So legends tell) he lonely wends,  
And back through all that shining host  
His mandate sends.

### THE WEAVER.

FOR years within a mud-built room  
For Arva's shrine he weaves the shawl,  
Lone wight, and at a lonely loom,  
His busy shadow on the wall.

The face is pinched, the form is bent,  
No pastime knows he, nor the wine;  
Recluse he lives, and abstinent,  
Who weaves for Arva's shrine.

### LAMIA'S SONG.

DESCEND, descend!  
Pleasant the downward way,  
From your lonely Alp  
With the wintry scalp  
To our myrtles in valleys of May.  
Wend then, wend!  
Mountaineer, descend!  
And more than a wreath shall repay.  
Come — ah, come!  
With the cataracts come,  
That hymn as they roam,  
How pleasant the downward way!

*Herman Melville.*

### PHILIP REPORTS FOR WORK.

HAT is it that you hope to do over there? What is the most you have promised yourself?"

"Why do we always say 'over there'? Is n't it time, if only as a courtesy, we began to call it home?"

"Should I be at home—on the desert plains?"

"You might concede something to the fact that you will soon have a husband and a son there."

"I might concede everything, and go myself! But then there would be one reason less, though a poor one, I admit, for your coming back. No; you need not remind me, Philip, that I have nothing left."

Mrs. Norrisson was a pretty, spoiled mother; one that should have died young and lived in the memory of her charm. She could argue, very logically, from her own predispositions, but she failed in that logic of the heart which enables a woman to feel another's reasons. Nothing could have convinced her, now, that she had not a bitter cause, as the sorrows of women go, even with one who sends a son into battle or gives him up to a fatal choice in marriage. Yet all her grief was that her son had chosen a profession which she called narrow, and elected to practise it in his, in their, native West; while Philip's culpability lay in that he had not revealed to her this purpose as it grew. There had been the natural affection, but never a perfect understanding, between them. If Mrs. Norrisson had guessed this fact before, she knew it now, passionately declaring there is no mystery in life like the being one calls one's child.

Mr. Price Norrisson had married his wife "just off the range," as they say in the cattle countries; sixteen, and the most beautiful girl he had ever met; mixed blood of course. The marriage was pronounced, in the language of his set, "a good gamble." In the course of her subsequent remarkable social progress Mrs. Norrisson had left the range far behind. The fields in which she sought distinction lay to the east; and here she would have detained her son but that some reactionary sentiment in the young man called him back. Mr. and Mrs.

Norrisson had been much apart since the experiment of their marriage began,—he, frankly in pursuit of money; she, of the most enlightened ways of spending it,—and Philip had idealized the parent he saw least of. He was prouder of his father's summons, in the name of his Work, than a young cadet of his first commission in the service of his country; but how commend this enthusiasm to a woman professedly weary of both husband and country?

"I am looking for an engineer," his father's letter ran, "with about what I take your qualification to be, to go on big irrigation work—an extension of our present system near the town of Norrisson. Don't you think you had better come and see what you can make of it over here? I shall have use for all your science,—you should have got considerable by now,—and I can give you the practical experience no engineer, no American engineer, can afford to dispense with. Cable me your answer directly. The place can't wait."

Mrs. Norrisson held this letter, folding it and pinching it small in her delicate but not generous hands.

"What does he want with an engineer?" she demanded. "A county surveyor is all they need to build what they call their 'ditches.' They are always working against time, and the quality of the work is quite a second matter. Take my word, Philip, your methods will not suit your father. He values nothing but time. He is what they call a driver."

"That, quite possibly, is what I need," Philip answered with provoking humility—"to learn something of that drive, which has done so much over there."

"So much and so badly," the fair renegade retorted. "I don't deny they have pluck; but look at their chances, in a new country where they are first in the field! You'd think they might afford at least to be honest. But they have the courage of their opportunities. Take the history of their continental railroads, for example. But granting you can keep out of all that, what sort of a school is it for a young man who has n't finished his education? Your father built a ditch over there—the one that has made Norrisson—not only without consulting a single engineer of reputation, but actually in defiance of a very able one, a sort of partner of his. He stood in his way, and your

father got rid of him, because he had a conscience about his work. You need not look at me, my dear, as if I were talking scandal. He will tell you the story himself. He glories in succeeding in just that illogical, immoral way. It is the triumph of makeshift. That is his school of 'practical experience.' They say the country drives them, and they have to keep the pace, somehow, or 'get left.' I don't go into the philosophy of it. I'm only speaking of its effects. You can see them in me. I was bred in that same school; I got on famously; I could do anything I pleased up to a certain point. There I stopped. There I have stopped for want of thoroughness in the beginning. I hoped you would be a school-boy till you were twenty-five, then take five years for travel. By that time you would have been something more than an 'American engineer.' I meant that my son should be a citizen of the world, not a local man in a profession half learned."

"I'll come back, my dear mother; but a man must choose his field. It strikes me the field for Americans is America; and if the conditions are so different, the sooner I get over there and learn them, the better."

"Who, then, are the Americans? Are you an American? If you are, you get precious little of it from me. My father was an Englishman, my grandmother was a Spanish Creole—a Californian I suppose you would call her. Why should n't we revert, through these knots in our blood, to the people we come from—who had something that could be called race? I am convinced it is the homesickness of generations that stirs in me whenever I fancy myself back in that ugly, raw, indiscriminate region you ask me to call home. I may be homeless, but *that* is not my home."

"Has it ever been suggested that you should call the desert plains your home? Come, at least, as far as San Francisco."

"I might as well be in London, so far as the society of my husband and son is concerned."

"Well, not quite."

"The difference in miles does n't begin to make up for the difference in point of residence. But it's not a question of my going back; whether I go or stay, my tastes, my principles, are the same. But for you it will be the turning-point. I am sure that you will commit yourself to something pitiable before the year is out; probably to staying there forever. There's a fascination about the life, as there is about the first stage of every return to barbarism. When the rope begins to strain, it's a temptation to reverse the wheel; but is it worth while to send the bucket to the bottom again, after so many turns have brought it nearly to the top? No; you are making a distinct step backward. A man, I have always insisted, should go east for

his education, his accent, and his wife. He may go west for his fortune, perhaps; but you do not need a fortune, Philip."

The last word was a plea. But Philip could not forego his retort.

"Because my father has made one for me? Is that a reason I should spend my life in Europe, posing as a citizen of the world?"

"Ah, if you are posing! I thought you were doing something more sincere. But now I see you have never been that. You have taken the way of all men with all women; flattering them, conceding everything till the moment of discovery. And then they ask, why it is a woman must always make a scene! Well, go and be 'foot-loose,' as they say over there! But don't get beaten, and don't 'get left.' For if you do, your father will lay it all to Europe and to me."

Philip cabled that he would report at the company's office in New York, at once, where he hoped for further orders. He knew that there was such a town as Norrisson, a metropolis of the desert plains, named for his father, who had been the Moses of emigration thither, even to the smiting of the dry hills to furnish forth water for the reclamation of the land. But where lay this field for practical experience, in what precise quarter of his big native West, he was as ignorant as if he had been born a cockney. He had a mixed idea that the people of Norrisson lived in semi-subterranean dwellings called dugouts; that their only fuel was sage-brush; that their sons herded cattle; and their daughters, phenomenally pretty and ungrammatical, ran barefoot, like the sage-hens, until each married her cowboy or successful prospector and became a boarding-house belle in San Francisco. These images were mainly derived from his mother's generalizations,—she was a sad recreant to have been born under the Star of Empire,—and from her free use of hyperbole where her feelings were involved. She had a singular aversion to the West, and when she talked of her girlhood there,—a time of unimaginable freedom, by her own account,—it was with a bitterness Philip could only marvel at, seeing that even her distorted descriptions conveyed, in spite of herself, a picture that interested and attracted the listener.

He began his journey in anything but a triumphant humor. He was preoccupied with his mother's disappointment, and some of her arguments stayed with him after the heat of contention had subsided. A half-doubt of his own choice hampered his outlook. It was not till he began to go down the long continental slope, westward from the Port Neuf, far west of the great divide, following the Snake River Valley, and towns and farms gave way, and solitary buttes stood for church-steeple, and

dusty corrals for lawns and meadows, that he saw his work before him, and began to look forward instead of back.

## II.

## HE IS INTRODUCED TO THE SCHEME.

MR. PRICE NORRISSESSON was at breakfast, eating his first course of iced fruit and going through a pile of newspapers, when Philip made his appearance on the morning after his arrival. The hours of his father's establishment were a shock to his system; he had not thought of breakfast at half-past seven. Wong, the Chinese butler, in a white, starched blouse, the sleeves of which fell to the knuckles of his tawny, pointed hands, was making coffee in a Vienna coffee-pot with the solemnity of a priest preparing an oblation. One side of the room was filled with a great array of glass and china in cupboards built into the wall; the opposite side was devoted chiefly to a huge painting of the Shoshone Falls, the work of a local artist, after a photograph by Jackson of Denver—such an acquisition as the bored possessor sometimes deprecates by explaining that he took it for a debt. A long window on the third side, divided into casements, opened upon a grass terrace where a lawn-sprinkler flung its dazzling mist into the sunshine. Outside there was a humming stillness, a perfume of locust-blooms, a breeze that blew freshly into the room, whipping the silk sash-curtains out from the rods, turning up the corners of Mr. Norrisson's newspaper, and tumbling the yellow roses that filled a majolica bowl in the center of the table.

"You're about four inches longer than you were when I saw you last," said Mr. Norrisson, measuring his son with his keen, appraising glance. "Don't run to fat much: queer how white everybody looks who's just out from the East. You ought to have got a Western color on shipboard."

In the next five minutes he had asked Philip a number of questions, rather difficult to answer, about his mother. "She's still too good an American, I suppose, to be happy out of Europe?"

"Where it is well with me, there is my country,' is her creed national," said Philip, after a moment's hesitation.

"And how is it with you? Have you got outside of all your national prejudices?"

"I have come home," said Philip.

"Good enough! And what does your mother think of your going to work?"

While Philip fumbled in his memory for a speech of his mother's that would bear repetition, Mr. Norrisson answered the question for himself.

"Did n't expect it, of course. Well, she has

been running your education for quite a while on the European plan; I rather thought it was my turn now. And when I've set you on your legs it will be your turn. Then you can go back if you want to. But I guess after you've been two years in the West, with something to do, you won't want to go back. Let me see, how old are you, Philip?"

"Twenty-three, sir."

"You don't say! It's a fact. You were born the year of the big strike on the Comstock."

"And Phosa must be forty years old!" was the thought Mr. Norrisson did not utter. He was quite used to thinking of himself as a man of fifty-two, with a chest-measure that increased rapidly downward. But Phosa a woman of forty! His slender, narrow-eyed, rose-mouthed gipsy, in whom he had forgiven everything because of her youth! How could she endure the fact herself? The reflection made him feel more tenderly toward her.

Philip took from his letter-case a photograph, and pushed it across the cloth. Mr. Norrisson took it up and looked at it fixedly, but without a change of expression. "For me?" he inquired.

"If you like it. It is mine only because I helped myself to it. My mother has her picture taken every now and then; her *journal intime* she calls the collection. But she is very jealous of its circulation."

"She need n't be afraid, if the others tell no more about her than this one. I can't read her journal. This picture does n't even tell her age."

"Neither does her face."

"You better keep it," said Mr. Norrisson, handing back the card with a confirmed stoical patience in the last look he gave it. "It may tell you more than it does me. I presume you will miss her a good deal. She's the kind of woman who occupies a man's mind. She did mine until I found I could n't think about her and do anything else. I don't miss her so much as I used to; I don't let myself."

Mr. Norrisson now began upon the second course of his substantial breakfast—trout from the hills, served in a wreath of cresses, with curly slivers of bacon, and potatoes hashed with cream. Philip was breakfasting Continental fashion, his father eyeing him disapprovingly.

"I'm going to take you down the line this morning. You can't ride twenty miles on a roll, a cup of coffee, and a cigarette. Eat something, boy! You don't know when you'll get your next meal."

Philip fancied that this prompt call for "boots and saddles" might be somewhat in the nature of a test, and was careful not to keep his father waiting, though the horses were brought round

at once and he was not dressed for riding. Mr. Norrisson glanced at his son's trousers and faultless foot-gear, and ordered a servant to fit him with a pair of spatterdashes. His "narrow-gage" hat was exchanged for a grass-cloth helmet, and they set forth.

From time to time, as they rode along, the father cast an eye upon his son's seat in the saddle. At length he spoke of it, approving Philip's readiness to "catch on" to the American way of riding. Philip disclaimed the compliment, explaining, with some particularity as to terms, that he had been taught to ride in the French school, which had certain points of resemblance to the American, notably the long stirrup. Mr. Norrisson snorted at the idea of a resemblance; he said that the Americans had no school.

"We ride because we want to get there. A horse is merely the extension of the powers of a man: if the man likes to make a show of himself he can do it better on a horse than on the ground; and that, I take it, is the fundamental principle of the *haute école* in riding."

They were following the lower bank of the irrigation-canal toward the head-works on the river. The stream which supplied the canal was an uncelebrated tributary of the Snake, called the Wallula, fed by melting snows from the mountains, and now at the flood. Every long, hot day set the river roaring with added volume at night; and the dry-plains wind, which blows strongest toward morning, like the teral of the tropics, augmented the sound of its booming, which could be heard for miles, and might have been mistaken for a distant growl of surf. The canal was carrying to its full capacity, a guard of men watching it day and night. Mr. Norrisson pointed out to his son that the location at which the main ditch had been taken out of the river was not a particularly good one; a fact which Philip had already noted.

"That ditch had to go through," said his father. "There was only one spot at the time for the head-gates. Better risk the patching and propping than let the scheme grow cold on my hands. Here, you see, we had no *garanties d'intérêts*, like your gentlemen of the *Ponts et Chaussées*. We had no security but faith in the ditch. Private capital, if it's non-resident capital, is skittish unless you can show results. Our parties got scared at the outset. We had to give up our scientific lay-out, and build as we could, with what money I could get them to put up. We made a bad job of it, but we made it pay. But there is just where the pride of your foreign engineer knocks him out. We had one of them with us at the start, but he could n't put up with our American methods. It hurt him more to botch the job than to see the whole

scheme fall through. He had his professional reputation to look out for; I had my reputation as a business man. If I undertake to make a deal, I make it; if not on one proposition, then on another; carry it through, somehow, and stop the leaks afterward. We were the original partners in the scheme, Dunsmuir and I. He has got the location that we should have had only for the split between us. He is canny enough to see that he holds the door to the high line, the only ditch-line that can reach the big tracts below, that we can't reach—300,000 acres of the richest arid land in southern Idaho. We have been freezing him out, you understand. It has taken fifteen years to do it. I brought you over here to be ready for the new scheme that is to take in Dunsmuir, location and all."

"And is Dunsmuir prepared to be absorbed?"

"Bless you, no. It is n't time to close him out yet. You don't like the *vi et armis* method, I see. Well, don't be alarmed. There is n't going to be any fighting, not even in the courts. Dunsmuir's claim is worn pretty thin; but if it came to a tussle between us, the side of a big company is always the unpopular side. Dunsmuir has been laughed at and called a crank these ten years; but people have got used to thinking of him, holding on with a bulldog grip, staking every penny he's got on the game, and year after year of his life—not to speak of the lives of his wife and children. It's the sort of spectacle that stirs the blood of your true Western man. There is never any sentiment about the rights of a company. It will be a delicate bit of work, I presume, this closing deal with Dunsmuir. I hear that solitude has become a disease with him; that he's completely warped, like a stick of timber left out in the sun. He was sound enough once. We might have been of immense service to each other, if he could have brought himself to compromise with that professional conscience of his. But pride before everything! He had put his name to the first report on the scheme: it should never go through, then, with his consent, but on what he called a sound basis. Of course there were one or two little issues of a personal nature. I'll tell you the story some time, but the gist of it is just here—Dunsmuir is a sore-headed theorist, and I am a practical man."

They had reached the measuring-weir of the main distributing-channel, and the talk plunged into technicalities. Dunsmuir's name was not again mentioned between father and son until that evening, in the summer smoking-room, when Mr. Norrisson returned to the story with evident relish of the opportunity to review it with an intelligent listener. He refrained from making points against Dunsmuir, resting his case honestly or carelessly on its merits, such

as they were. He did not pretend to be proud of them, but treated the whole entanglement as one of the exigencies arising from a practical man's obligations to his business.

Above their heads, as they talked, a Japanese lantern softly glimmered in its sheath of wrought-bronze filigree; the pattern of the metal screen wavered upon the circle of light cast upon the ceiling, like the shadow of leafy boughs on a moonlit curtain. Mr. Norrisson was seated in a deep, leather chair, one foot resting on the ratan lounge where Philip was stretched out, looking both sunburned and pale after his first day in the saddle. He was observing his father, and smiling to himself at the contrast that bold masculinity presented to the fair, changeful, feminine type which he was accustomed to watch, in his usual rôle of the listener. Ugliness in one another has a certain fascination for men, where its signification is power. Philip had seen famous historic heads by the Flemish painters, the prototypes of his father, set off by the ruff, and gold chain, and furred mantle that would have suited Mr. Norrisson's middle-aged development much better than a pongee sack-coat and a linen collar. Yet he understood what an offense this man of broad instincts and hard, vital force might have become, with his sanguine eye and sagging underlid, to the petted, disdainful sensibilities of the wife who for twenty years had contemplated only the points of difference between them.

"I was joking this morning, you know, at the breakfast-table," said Mr. Norrisson, not very explicitly.

"Yes?" Philip inquired.

"When I said it was my turn now. I want you to understand that I have n't interfered to please myself, though I enjoy having my son around as well as any man. It was on your account I called you home. I was afraid she'd polish away at you till all the bark was off, and then your growth would stop. That was one trouble with Dunsmuir. He'd been trained up to a certain size and shape, and he could n't change to fit the circumstances. Dunsmuir was not much above thirty when I first knew him, but he was already an engineer of some distinction. He had done excellent work in India, in charge of one of the divisions of the Lower Ganges canal. He became disgusted with what he considered the gross inequality between the positions of a civil and a royal engineer in the Government corps. I believe there is some room for jealousy in the treatment of the two branches, and Dunsmuir was n't one to pass over a thing like that. When he had served his term he decided to quit the Government service. He had got the colonizing fever, moreover, and was resolved to do something on a large scale over here, making use of his Indian

experience to start an arid-land scheme on the colonization plan. I was looking up the subject of irrigation myself; it was the spring of '74, and mining stocks had got a black eye. I made up my mind then that irrigation was going to be the next big boom.

"Dunsmuir was coming down from the Northwest, on horseback, traveling light with a couple of pack-animals and a half-breed guide. I was on my way across from San Francisco. We met at Winnemucca, where I dropped off the train to wait for the stage. He had got wind of this tract through some old Idaho City miners he struck at Vancouver. I'd had my eye on it, going back and forth, ever since '60. I happened to know there was a possibility of the U. P. pushing across it, and that the lands must still be open for occupation; but it was all vague, in the future, with me. He was first on the ground; but he wanted to go in with some American, because, you know, an alien can't locate a water-right under our Government. Well, Dunsmuir turned up that evening, as I was saying, and we sat up talking irrigation, soils, crops, climates, and railroad facilities till two o'clock in the morning. The result of our talk was that Dunsmuir gave me his spare saddle-horse, and we rode north together. I don't know that I ever had a pleasanter journey. Dunsmuir had a keen eye for a new country; and like most Englishmen he was a bit of a farmer. He knew soils and climates, and was watching out for the flowers and birds and all the living things of the desert; and when we rode at night he had the whole map of the stars in his head like an old navigator. Those lands, as we rode across them, two days and two nights, seemed to take hold on his imagination. He saw them with the eye of a dreamer, but he sized 'em up just as coldly as I could. I never was surer in my life that I had got hold of the right man. But when it came to laying out the scheme in detail, I began to get scared. His very success, formerly, in India, was a disadvantage to him. However, I'm ahead of my story. We agreed to take hold of the scheme together. He wanted me to take it over to the other side and offer it to some of those swell philanthropists who want room, outside of their estates, for their crowded agricultural population. But I have always had a preference for home capital when I can get it. However, it was chiefly a question of time with me, and you can't hurry an Englishman. We had various nibbles. I closed finally with the Larimers, a New York loan and mortgage house with agents all over the West. They knew the country pretty well, and were in some of the railroad combinations that were likely to benefit it in the future. They were really anxious to get in here,

and they sent out one of their men to look the thing over. He was satisfied, and they put up fifty thousand to enable us to go on with the work and hold the right, while they placed the rest of the money.

"Now you'll notice how Dunsmuir's training got away with him. Here, with no demand as yet for water, he used the same care in laying out his system as in India, in a thickly settled country on a tail division, where every inch of duty was required. Well, there never were such surveys made in this part of the country as Dunsmuir's—longitudinal sections, and cross-sections, and elaborate detailed maps; and everything costing, you know, like the deuce. He put two hundred men on that heavy side-hill work in the cañon, and lined his earth-banks with masonry. Dunsmuir's cry was always that no work is so expensive as cheap work which has to be done over. I could n't gainsay him on technical grounds; what I did urge was this: put your men below, on the easy part of the line, and you can show our people, when they come out here, ten miles of ditch that will have cost no more than half a mile up there in the cañon. Dunsmuir called this "jockeying the scheme." The entire ditch below the cañon could be built, he said, in less time than those first three miles and the head-works. Why, then, should he push forward the lower work merely to let it stand waiting to its detriment? I had nothing to do but to bring forward my usual doctrine of expediency, which Dunsmuir scorned, both as a man and an engineer.

"It turned out precisely as I expected. Our people were to have come in June, when the country is at its best; they did n't get here till September, when it looks its worst—dust on the plains six inches deep; smoke from fires in the mountains, cutting off the view; hot; and the river sunk to a creek. The miners said they had n't seen it so low for twenty years. Our people doubted that we had even the water we claimed to have. They doubted everything but Dunsmuir's figures, showing what the cañon work was costing. They would n't listen to his averages; it was the big figures that stuck. They proposed to cut down the canal to half its size, covering a portion of the lands first. Later, if the water held out and the settlement demanded it, the canal could be enlarged. Well, you can't imagine Dunsmuir's disgust. We had a battle royal—Dunsmuir's note-books, his Indian experience, his historical precedents, all his professional artillery, and his personal enthusiasm against their cold, hard, business sense. They were scared, it's true; but I did n't wonder they were scared. And Dunsmuir would n't go a step to meet them. He had taken offense at their criticism of his economy.

Did you ever see a magnificent handler of money who did n't think himself a great economist? He was suspicious, moreover, of their plan of opening the lands for settlement. They talked more about that part of the business than was advisable—to Dunsmuir, at least. They were square men enough, but Dunsmuir thought they meant to squeeze the settlers. Privately he did n't wish to give them control of the scheme. He told me as much, and urged me to let them go, with what stock their money represented. I knew we could n't afford to play with our chances, and I wanted to unload and be ready for the next thing.

"But you must know I had an anchor to windward. While we were waiting, seeing how Dunsmuir was carrying on with the funds, I privately got possession of a little bundle of water-rights down the river; all put together, they represent our present system. I did n't inform Dunsmuir what I was doing; he would have considered it a sort of potential bad faith, and I did n't wish to take issue with him on any new grounds. We had plenty to discuss as it was. When I saw our big deal growing cold, I showed the Larimers this little pocket-scheme; no rock-work, no masonry, line of ditch directly upon the lands. They liked it. We closed the bargain, and then I offered to go halves with Dunsmuir. Lord, how he did kick! I had been forelaying for the event of failure, he said. I had betrayed our mutual interest for a private deal of my own. He made nothing of my offer to go snacks. A vain show, he called it, offering him a share in a rotten scheme which I well knew his reputation would n't allow him to touch. He called it rotten because we were proposing to raise money on contracts for water which, he said, we could n't supply. Why could n't we? Because we had n't the first elements of a ditch; to begin with, we had no site for our head-works. Very true; but we have made shift to get along without one. He argued that our failure would be a blow to irrigation in this section for years to come. Very true—if we had failed. He could n't understand that one scheme was no more to me than another. To hear him talk of how I had weakened, you'd have supposed there was some principle at stake. What the big scheme really meant to him, I'm not sure that I know. Anyhow, he would n't look at any substitute. He might have gone in with us; he preferred to hold out alone against us. Since then I have treated him as I would any other obstacle to my company's success.

"He built him a house up on his location, as solid as the hill it stands on. I have come to stay, was the idea. He brought his family over, and he raised money on the other side to

buy out our interest. I advised our people not to sell, to keep their hold on his scheme. Ultimately, I knew we could freeze him out. Our game has been to let him make his deal, and then quietly come in at the last and be the card too many. The tendency has n't been to increase Dunsmuir's friendship for us."

"How was it, sir, that with your interest in the big canal you did n't wish it to go through?" Philip inquired.

"Our interest was a small one, though with an option of increasing it on certain terms. We should not have had the controlling voice in the management; it might have gone against us, conflicting with our own ditch. We wanted the thing to hang in the wind till we were ready to take hold of it ourselves, as we now propose to do, and make the two ditches into one system under our own management. Then we shall abandon our shifty head-gates, and build on Dunsmuir's location, and supply the lower line from the upper one. If Dunsmuir could be approached like any other man, on a business basis, it would be easy enough to compromise; it's as much to his interest as to ours; but he's terribly complicated. We've got to satisfy his science, and his principles, and his pride, and his romantic sentiments, and the bitterness of fifteen years' steady disappointment. It has been hard for him to look on and see us succeed by the very methods he despises. Probably the hardest thing for him to forgive us is the plain truth that we are not so black as he has painted us."

"Possibly that truth is not yet obvious to him."

"Possibly not. In that case it must be painful to him to reflect upon the ways of Providence."

The two men smoked awhile in silence.

"My definition of a theorist," Mr. Norrisson resumed, "is a person who is never satisfied with his own work, nor with anybody else's, not even the works of the Creator. Meet them where you will, they are always obstructionists, injuring other people's chances, coquetting with their own, but terribly sore-headed if they find they've been left out in the cold. In politics they are Mugwumps; in religion they are no-devil Unitarians; and if they read novels, they only read 'em for the 'truth to life.' No, sir; I've no use for a theorist — not if he's a man. Women are born that way sometimes, and can't help themselves."

Mr. Norrisson was in very good spirits. He felt that he had told his story tolerably well and with fairness to the other side, and he was confident that he had carried his son with him. He gave Philip credit for being, as he would have expressed it, "a boy of sense." Philip was certainly impressed. He sat thinking the story over, and was not prepared for

the change of subject when his father spoke again.

"Do you think your mother will come home, Philip? What does she say about it?"

"From what she says, I should hardly expect it; but it is n't always safe, you know, to take a woman at her word."

"No," Mr. Norrisson coincided grimly; "I took one at her word some five and twenty years ago, and it was the greatest wrong, it seems, that I could have done her. "No," he corrected himself, after a moment; "I took a child's word for a woman's, thinking I could win the woman afterward. And that's why I forgive her. I took the risks. She did n't know what the risks were. It was n't a square game; but I've paid the shot, and I've never complained — more than I'm complaining now; and I don't say, if it was all to do over again, I should n't take the chances just the same. What is all the rest of it worth if you can't marry the woman you want? And if you can't make her happy, who knows whether any other man could? Have you always made her happy, Philip? She loves you."

"I am not making her happy now."

"No; but she blames me for it. All her talk about America, you know, means me. If I were in Europe, she would come home."

"I don't think so," said Philip, earnestly; "but of course I don't know. Her very bitterness seems to me to be a sign there is feeling left. I had not thought of it before, but now it comes to me that she talks about — America as if she were fighting some half-stifled plea for the country she says she deplores."

Both men smiled at the word.

"Well," said Mr. Norrisson, "when she does come back I shall expect to see her out here. She 'deplores' the West, but she was born a Western woman, and she does n't love the East now, you know!"

### III.

#### THE CHILDREN OF THE SCHEME.

BEFORE they separated for the night, Mr. Norrisson planned with Philip a reconnaissance up the line of the "old ditch" to look at Dunsmuir's location. The next day the manager was called away, and it turned out that Philip rode up the ditch-line into Dunsmuir's domains alone. He was told that about three miles above the mouth of the cañon, where it debouches upon the plain, he would come to the "big cut," a spot often chosen by excursionists as a camping-ground. Was the cañon, then, a place much frequented? Philip inquired. At certain seasons, yes; when the young folks went on picnics and riding-parties. Tourists generally took a look at it on account of the lava bluffs

that rose, in some places, two hundred feet above the river, to the level of the hill pastures.

"But don't you go foolin' round the house. The old man don't take no stock in strangers up there on his location, you bet!"

Bearing this in mind, Philip entered the cañon. The bridle-path hugged the shore, winding in and out amidst dusty sage- and willow-thickets, and boulders fallen from the bluffs. The first sign of Dunsmuir's occupation was the cabin of the "force," where a purblind mongrel collie barked at him, without crawling from the house-shadow where he lay. Half a mile farther on he passed the force itself—two men at work blasting rock on the slope of ancient debris escarped against the bluffs. The sun, declining in a cloudless sky, hung midway between these barriers, heating their vitreous surfaces to the temperature of a brick-kiln. The breeze that faintly puffed and died could be tracked on its way down the trail by the dust-pillars whirling before it. It smote Philip in the face, and left him with the sensation of having been exposed to a sand-blast. Across his sight the heat-veins quivered; the river's monotonous ululation drowned the silence—a sound of mocking coolness to a horseman on the blinding trail. Philip saw ahead of him a black notch of shadow, and spurred forward to the shelter of the "big cut."

It was a noble, unroofed gallery, sixty feet across the top and forty feet upon the ground, with floor and slope-walls of cut stone laid in cement; bending in a mathematical curve around the hill, and so averted from the sun. It might have been the hall of approach to a tomb of prehistoric kings. But here the perennial picnicker had made himself at home; broken bottles, tin cans, greasy paper bags desecrated the pavement laid for the tread of waters which fate and that instrument of fate, Mr. Price Norrisson, had conducted another way.

Philip gave himself up to a moment of frank sentimentality over this good work come to naught. Like the work of many another theorist, it had been in advance of its time. He sat still, breathing his horse, loath to quit the shadow for the glare. More than once he heard the call of a bird, the only voice in the cañon, before its peculiar, indeterminate, yet persistent rhythm took hold upon his ear. It was not the "perfect cadence"; it would have been difficult to repeat upon any instrument the first note of the combination, still more the doubtful fragment which followed, dropping down the scale and ceasing suddenly, the final note wanting. While he waited came the pure, sad postulate again, unsupported in the sequel; and then the haunting pause. Philip listened, fairly thirsting for the sound so delicious in the hot silence. Where was it, the poet-bird? No-

thing stirred in the dead air of the cut; there was not a leaf nor a spear of grass to record that a breath of wind had wandered into it: but the broken utterance came again and again, as if aware of a listener and trying to make itself understood, always with the one word wanting. Nothing came of this lyric pause: Philip rode on reluctantly, and his horse's tread silenced the bird.

By the distance he had come from the mouth of the cañon he judged the house itself could not be far away; and as the walls of the cut fell back he saw it straight before him, the only house for miles—as distinct in that absolute light as the picture in the small lens of a telescope, yet unreal and dreamlike in its dwarfed proportions because of that very perfection of detail. A long, yellow house of adobe, or plastered brick, with low dormers scarcely breaking the line of the roof, peering out like saurian eyes into the glare. The roof, sloping outward at a slight angle, rested on the squat pillars of a massive portico, which shaded the entrance to the house. A side entrance for carriages was through a blind wall, running back like the wall of a court; and beneath the arch of the gateway hung a bell for announcement or warning. The sun beat upon the dull red roof, projecting the shadows of smokeless chimneys, and emphasizing the dormers with lines of black. The aspect of the place was that of sullen, torpid seclusion. The plateau, or bench, on which it stood parted the meager waters of a stream which trickled down a side-gulch, one of the laterals of the cañon. Small, stunted trees clung to the slope, crouching all one way, as if the wind were ever at their back. A blight had withered the patches of thin grass on top; but up the gulch, following the stream, a double rank of poplars towered, their dark-green tops clear-cut against the sky, a landmark in that dun country of drought.

Philip concluded that all the water descending from the gulch had been hoarded within the court, for here and there a fruit-tree overtopped the wall, or a vine flung a loose spray over it; showing there was a heart of verdure inside that stone shell which the house presented to a stranger. Scarcely a leaf trembled in the hot, intermittent lull; even the river seemed to hold its breath; then, with a hoarse sigh, the sound bore down again; a sheet of ripples spread, whitening the current; the poplars began to rock and strain; and a flicker of white, like the folds of a thin curtain, blew out of one of the lidless dormers in the roof.

Leaving the cut, the trail made directly toward the house. Philip saw that he could follow it no further without trespassing; but as he proposed to see something more of the cañon, he rode back to the shelter of the cut,

tied his horse, and returned to the trail on foot. His plan was, if possible, to gain the top of the bluff, whence he could survey the region and study it as upon a map. He marked where a thicket of wild shrubs flourished close at the foot of the cañon wall. The water-supply which they had "located" was the storage from melted snows, collecting in hollows of the rocks above, which had dripped, or fallen in slender cataracts, down the face of the bluff. Discolored streaks showed where, spring after spring, the muddy overflow had descended. The slope of debris here rose to within fifty feet of the top, and Philip decided to try this spot for the ascent, trusting to find cracks and footholds caused by the action of the water. His spurs were in his way as a climber, so he took them off, and went light-footed up the talus as far as the foot of the bluffs. Here, in the shade of a huge buck sage, ablaze with yellow blossoms, he threw himself down to rest. Already his prospect was immensely enlarged; he had gained a cooler stratum of air; he could see the formation of the cañon from end to end, from its rise in the hills to the gate of the river's departure. He could pick out the rocks and shallows in the brown water beneath. Tons of boulders, fallen from the bluffs, lay embedded near shore, breaking the current into swirls and eddies. The river had worn a way down to its present bed, from the level of its former path, through a fissure in the ancient lava-flow which once submerged the valley. Such was the word of science respecting its history, a revelation to be classed with visions and dreams of the night. Had Dunsmuir taken counsel of nature during his fifteen years' waiting, and learned patience in the daily presence of this astounding achievement? Or had he fretted the more for these silent agencies, witnessing how long, how heartbreaking in their slowness, are those works which endure; how the life of a man is as the frosts of a single season to the accomplishment of one of nature's schemes?

Below the house the river's channel pinched suddenly, and the volume of waters rushed down, with a splendid outward swirl, between two natural rock-piers resembling the abutments of a bridge. This spot Philip accepted at a glance as the famous location. Here, upon this footstool of the bluffs, Dunsmuir had planned to build his dam and waste-gates. The river was to have been raised to the level of the big cut, and its waters transmitted thence, by the high line, to the plains. It was a fine, courageous piece of fancy, from an engineering point of view, and conceived closely within the bounds of practicability; but it was the dream of a potentate with the credit of a nation to back him. Philip saw how alarming it might have been to a few private capitalists, who were

not building for fame or for posterity. Yet the dreamer's time had come. The only doubtful issue now remaining was the personal one—upon which men waste their lives. Philip was beginning to dread it in proportion as his sympathies went out to the man whom his father was quietly encompassing.

Suddenly a hand, unseen, touched the strings of a guitar close to his ear, the sound proceeding from the heart of the wild-sage thicket. Amazed, he sat listening, while a boyish voice shouted out a Spanish chorus, with a most deplorable accent, but in excellent and bold time, to a somewhat timid touch on the guitar:

I love them all, the pretty girls,  
I love them all, both dark and fair.

"Be still a moment; I thought I heard a step."

The accompaniment broke off as a softer voice hushed the singer.

"Who could be stepping around here?"

The chanter began again, but the guitar was silent.

Philip rose up and stared at the tuneful bush. He walked around it, and saw that on both sides its crooked boughs brushed the face of the cliff; every twig was strung with blossoms of a vivid gipsy yellow; the whole mass, gilded with sunshine against the purple blackness of the rock, seemed loudly to defy investigation.

"I am simply positive there is some one," the girl-voice exclaimed, low, but so near that Philip started, as if a singing-bird had sprung out at his feet. There was silence and intense curiosity on both sides of the bush.

Philip peered at its winking blossoms awhile, and then essayed a way between the quickset and the cliff. The springy boughs yielded transiently; the rock seemed to give way; he caught himself, and stumbled forward into the hidden nest. It was a shallow cave, or pocket, left by the falling of a segment of sheer rock, completely screened from discovery, yet free to every breeze that wandered up the valley. A threadbare rug, a cushion or two of old-fashioned needlework, a few badly used books, a field-glass such as the stock-herders of that region use to pick out their brands at a distance, and the guitar, composed its furniture. The boy-singer had started to his feet, and Philip saw that he was crippled of one arm, which was neatly bandaged and carried in a sling. The girl had backed away on the rug, holding the guitar, while with her free hand she improved the arrangement of her skirts. The interruption had evidently been rather haughtily expected, but in the eyes of the charming pair, as they met his, Philip saw a change of expression, and both began to smile.

"Prospecting for anything in particular?" the boy inquired, in the slipshod speech of the frontier.

"Yes," said Philip; "for a way out of the cañon without crossing private grounds."

"How far have you followed the trail?"

"Until I came in sight of the stone house at the mouth of the gulch."

"Go ahead, then, till you come to a wire fence on this side of the gulch. Follow it along up, and cross above it where you see the poplars in the fold of the hills. Or you can go down on the beach and follow that along; only it's a bad climb back again. Are you for the hills or the shore?"

"I am for the bluffs. Is it possible to get up from here?"

"Well, not with a horse. You're not footing it?"

Philip explained that he had left his horse in the shade below, and was at present exploring the cañon on foot.

The young people took counsel together with their eyes. "There is a way up from here," said the lad. "It is our short cut to the cave; we come down from above. If I show it you, you won't give it away, will you? We don't care to have the mob in here, you know, with their egg-shells and paper bags."

Philip agreed to keep the secret of the "short cut" from the mob. The lad moved aside to give him room upon the rug, and the young girl handed him one of the cushions.

Plainly the couple were brother and sister; they might have been twins from the likeness between them, yet the unlikeness was equally strong. Both were gray-eyed blondes. Both were the slender, tawny children of wind and drought. The girl's smooth cheek was toned by the sun to the creamy tint of a meerscham in the first bloom of coloring. Her single braid of long hair, coiled around her neck like a torque, had broken silver lights that were lovely against the warm, even flesh-tones. She had deep-set eyes and dark eyelashes, and here the differences began: for the boy had the prominent eye of a talker; his brows and lashes were reddish gold; his beauty was altogether more striking than the girl's, but also of a commoner type. In his flannel shirt and belt and flowing necktie he might have been the ornamental member of a "Buffalo Bill" troop; while the maiden, seated like a squaw on a blanket, looked a perfect little gentlewoman. Her dress would not be worth mentioning but that Philip came afterward to know so well the dark-blue serge skirt, and the faded silk blouse with its half-obliterated stripe of pink, and the neat little darns in the sleeves, which were too short, and "drew" a little at the elbows. Everything she had on had been good in its day; all but her shoes, a

pair of forlorn little tan-goat buskins, whitened by dust and defaced by the rocks, the like of which Philip had never seen before on such a foot. Under the circumstances he would willingly have foregone the bluffs for the cave, with the very least encouragement, but it seemed to be taken for granted by his young hosts that he was in haste to go.

The youth had remained standing; he now turned toward the leafy tent-curtain and looked out.

"There is nothing up there," he conscientiously explained. "Seventy-five miles of bunch-grass, and the mountains, and the cañon, which you can see from here."

"That is quite enough for me," said Philip. "Still, I don't wish to be troublesome. I see you are not very fit for climbing."

"But the climb is nothing at all. We go up a crevice by steps in the rock; it's no more than climbing a ladder."

"Thanks," said Philip, seeing that he was expected to come to some conclusion. "Is the secret of the short cut mine to keep only, or to use, if I should come this way again?"

He looked at the girl, who had not risen.

"Alan—my brother, is master here," she said. "He is very fond of company," she added more encouragingly.

She rose now, showing her height, which was nearly equal to her brother's. Her face seemed childlike in contrast with her woman's growth. Her gray eyes just swept the surface of Philip's delighted gaze, seeming to see no more than that he stood there; but her lips kept back a smile.

Alan called from without, and Philip reluctantly made his exit as he had come. A few moments later he was roaming with his guide along the top of the bluffs. He saw the circle of mountains, and the seventy-five miles of summer-dried pasture dipping and rising to meet it. Through the midst the cañon plowed a great crooked rent. The level light encompassed them; their own shadows were the only ones in sight. The river's voice rose in mightier volume. They felt the first breath of the change, a freshness prelude the down-cañon wind which sets in, after sunset, toward the hot plains from the mountains.

"My sister has n't a notion that we've given the key of our back stairs to the son of Mr. Price Norrisson," said Alan, coolly, as he strode through the brittle weeds at Philip's side.

"If you knew me, was there any reason why you should n't have said so?"

"I don't know you, except by sight. You know, perhaps, that I am the son of Robert Dunsuir."

"Not until this moment; and I'm sorry if I have come by anything in the way of cour-

tesy which does n't belong to me. Shall I go back and tell her who I am?"

Alan was not sure but that he meant it.

"Oh, that 's all right. I was only laughing at the joke on my sister. I 'm the emancipated one of the family. I don't hold by any old-fossil feud. I don't care whose son you are. I hope I know a gentleman when I see one, though it 's little practice I get in the knowledge. We 're not all scheme-ridden at our house. I go in for a good time."

"And do you mostly get it?" asked Philip.

"Not often; and when I do I have to pay for it, as I 'm doing now."

"Really? You are paying at this moment? That 's perhaps hard on me again."

"This is part of it," and Alan indicated his bandaged arm. "But it 's the least part. Do you happen to be acquainted with any of the boys at Gillespie's horse-ranch in the hills, up the river a mile or so?"

Philip did not know Gillespie's.

"Peter Kountze is the man in charge. My father gave me a horse when I was twelve, and let me ride with the range-riders, as they used to send a boy before the mast to cure him of the sea. I was n't cured; and now he thinks I 'm turning cowboy. That 's why it was so unlucky my getting mixed up in that Pacheco business the other night when I was out with Peter."

"And what was the 'Pacheco business'?" asked Philip.

"Don't you read the 'Wallula Gazette'?" Then, of course, you don't know the locals: who 's in trouble, or who 's skipped, or who 's struck it rich in the Cœur d'Alène, or whose wife 's got a ten-pound boy, or anything. Well, I 'd got leave to go with Peter to Long Valley to help him round up some cattle. But just this side the bridge, before you get to town, we met up with Sheriff Hanson and his men, out after this Pacheco, who is wanted for a cutting scrape. Sheriff said Peter 'd got to go along, because he knew where Pacheco's girl lived, in the hills back of Cottonwood Gulch. Peter had no objection, only for me. I told him he need n't let that hinder—I 'd take the responsibility; and the boys said, 'Let the kid come along and see the fun.' I say, does this bore you?" Alan had caught his companion's eye wandering to the landscape.

"Far from it. But let us go to the edge, and take it comfortably, with the view below us."

"Like the gods beside their nectar," Alan suggested with his usual "freshness." When they were lying prone in the warm, brittle grass, with their faces over the brink, the lad went on with his adventure. His speaking voice was like his sister's, deep and sweet, with an odd, singsong cadence in it; a voice that atoned for his lazy,

corrupted accent. Philip found it very pleasant to listen to him, with the dreamy lights and motionless shadows of the cañon below them.

"We put out into the hills about moonrise. It 's a broken country after you leave the valley. We played hide-and-seek with the moon among the gulches—the little draws, you know, between the hills; Cottonwood is the biggest of 'em. Finally she broke loose from the clouds, and there was the cabin—no light in the window, but the greaser's pony stood puffing by the door, his cinch not loosened; so we knew we had n't long to wait.

"Pacheco heard us s'rounding the house, and some one else heard us too. We did n't count on the girl's taking a hand. She broke us all up, firing on us while Pacheco lit out up the gulch. Peter tried to shove me into the woodpile, but we were n't a man too many. I 'd have looked pretty in the woodpile! They said it was the girl hit me. Pacheco only fired twice; his horse was on the jump, and his shots went wild. If ever I see that little girl of his, I 'll give her back her bullet. The boys all laughed at me; said she spotted me in the moonlight on purpose. She did n't know what she was aiming at. Every time she fired a shot she gave a screech like a wildcat, and the boys would n't give it her back again because she was a woman. Anyhow, Pacheco got away, and I got into a precious row with my father. They had up the doctor from town, and he joked me; said the whole thing was in the newspaper, names and all. And that did n't help matters. Of course my father blames Peter, and he 's bound I shall cut the whole concern. I won't, because Peter was not to blame. We both lost our tempers, and so it 's gone on. I saw you that evening in town, and Peter told me about you. 'He ain't much for talk,' Peter says, 'but he 's got a good eye, and he takes in the country same 's a States' horse when you turn him loose on the range.' I 've noticed that. And if I had my pony back, I could show you some country. But I 'm not to have a horse again till I 've promised to quit riding with the boys; and promise I will not. Am I to pass 'em to windward as if they 'd got something the matter with them that was catching?"

Alan rolled over in the grass and pulled his soft felt hat over his eyes.

"I say, do you come up this way often?"

"I 've never been up before, but I 'm sure I shall want to come again," said Philip.

"I suppose you know all about the row between our governors?"

"I have heard an outline of it from mine."

"Is he very bitter?"

"You may judge when I tell you there 's no man of this region I so much wish to meet as your father; there is no engineer I would

THE HILL PASTURES.

ENGRAVED BY CHARLES STATE.

rather work under ; and all I know of him I have from my own father."

"You can afford to say those things ; you have been out of it, and your father has won. It's not so easy for us to be good-natured. It is for me, because I don't care about the scheme. I hate this arid-land business ; I think it's a kind of bewitchment, like the Dark Continent or the Polar Sea. Is n't there land enough with water belonging to it, without spending millions to twist the rivers out of their courses, and make grass grow where God said, 'Let there be a desert'!"

"Are you quite sure that was the word in the beginning in regard to these desert lands?"

"It don't matter," Alan retorted, superior, in his quarrel with fate, both to history and grammar. "It's enough for me that it's a desert now. I should let it stay so. My father can build other things besides ditches. Every spring and every fall the work's going to start up, and I'm to go away to school; and every spring and every fall it does n't, and here I am. I've no work ; I've no amusements ; I've nothing to do but loaf and study ; and my father will tell you I stick to my books like cobbler's wax to an oil-stone ! I've no friends but the boys, and now they're put down. It's no wonder if I kick."

"I hope you are not compromised through me," said Philip, smiling. "You showed me the crevice, it's true, but the cave I discovered for myself ; and I suppose I've the same right up here as the rest of the mob."

"Ah, you are not the mob. Ditches be hanged ! Have n't you been everywhere that I want to go ? and seen everything, and had the chance I ought to have had ? And yet I can't ask you home to dinner, nor even meet you here, without a hangdog feeling that I'm keeping something from my father—all on account of that idiotic scheme !"

"Dunsmuir, have you seen a book called the 'Heroes and Martyrs of Invention'?"

"No," said Alan ; "not if it was published within twenty years."

"It was ; but the heroes and martyrs are considerably older. For the most part, their persistence was the despair of their families, and the ruin of their fortunes when they had any ; but their lives make excellent reading. They were men, like your father, with a tremendous power of affirmation. They had a genius for waiting. Of course there's a tragic side to the life of every man whose eye is

fixed on the future. Do you know the Persian proverb, 'He that rides in the chariot of hope hath poverty for his companion' ? It is sad to spend years on those long journeys, trying to overtake the future, but you would not have us all time-servers, men of the present. And when they do arrive, those men of the future, their names are not forgotten ; or their works are not, which is better. I wish you were farther away from the scheme—"

"I wish I were," Alan interrupted. "It's a pity we can't change places, since you seem to fancy riding in hope's chariot with poverty alongside. I don't. There's my sister come to remind me. She's afraid I'll cut five o'clock recitations."

The girl stopped beneath the ledge, and looked up at the two faces against the sky.

"Alan, are you coming down?"

"No ; I'm going back the other way."

"Then I will take the books." She pointed toward the way she was going, by the lower trail.

"Dolly !" Alan called her back. "Come closer."

"I can hear you."

"This gentleman"—the announcement was made very distinctly—"is Mr. Philip Norrisson. Mr.—Philip—Norrisson ! Do you understand ?"

"Why do you shy my name at her as if it were a thing to be dodged ? My vanity protests," objected Philip.

"Oh, just to see her stare."

"She does n't believe you."

Philip had been watching the girl's face. She kept her eyes upon her brother.

"You are too silly for anything," she remarked in a conversational tone.

Philip longed to throw her a kiss in answer to her charming, puzzled upward gaze. As she turned to go there came the note of the cañon-bird pealing through the deep cut—the wild broken song that insisted yet could not explain. She looked up involuntarily, as if asking them to listen. Philip was fain to think that her eyes sought his for sympathy : he could not be sure.

All the way home, in the pink dusk, before moonrise, his aroused fancy was at play constructing a future which should include himself, his work, and the fair children of the cañon ; with ever the dreamy cañon-lights and shadows attending them on their way to better acquaintance.

### THREE SONNETS.

#### MAGELLAN.

HE left the landmarks of the past behind :  
The world of waters opened wide before,  
Wherethrough he aimed to sail forevermore,  
Seeking within the waste, with steadfast mind,  
Some brighter realm, untrod of human kind,  
Some happy island, some Elysian shore.  
From many an unknown coast he heard the roar  
Of breakers, heard the voices of the wind  
On unknown seas, but neither rising blast  
Nor wave could daunt his soul, firm-set as he  
Who first saw Calpe sink behind the mast,  
Nor turned his prow, bent to explore the sea,  
Whether its westering tides touched Asia vast,  
Or washed the steep shores of eternity.

#### CARLYLE.

SOMEWHERE, in dim Antarctic space, alone  
Upon the unsailed ocean's utmost verge,  
There is a nameless rock, that with the surge  
Wars, battling everlastingly. Uproven,  
Basaltic, black, time-scarred, from earth's fire-zone,  
It stands unconquered, hears the wrathful dirge  
The tempest utters from its whirlpool gurge,  
And fronts the starlight with calm face of stone.  
Carlyle was like that rock,—the peace was his  
That reigneth at the hollow whirlwind's core,  
The calm of faith in God,—as when the main,  
After long rage, drags down some rugged shore,  
And a deep stillness holds the night again,  
So, now, that where he was dull silence is.

#### A LOST MIND.

PALE traveler in regions saturnine,  
Whose feet tread pathways steep as Alpine steeps,  
Through passes desolate, where no light sleeps  
Of this world's sun or moon, and no stars shine,  
My heart aches when, with tender word and sign,  
I try to cheer the gloom that o'er thee creeps,  
Yet still thy soul its awful exile keeps,  
A wanderer through fancy's vast confine.  
The mind hath deserts, wastes unknown to men,  
Yet unforgot of God; of none more sad  
Sang Dante; by what whips of scorpions vexed,  
Thy torn soul, wandering far beyond our ken,  
Hastes through that hell, insanity, perplexed  
By the dark doubt that thou, or God, art mad.

EMILIO CASTELAR.

MILIO CASTELAR, the famous orator of Spain, is still a force in Spanish politics, his present attitude being opposition within parliamentary limits to the existing moderate monarchy. He had paved the way by his writings and his speeches for the revolution of 1866, which was put down by Serrano; as one of the leaders of the revolt he was condemned to death, but made his escape to Geneva; he returned during the troubles of 1868, when Isabel II. was dethroned, and labored for the adoption of a republican form of government, but the throne was reëstablished in 1870 with Amadeo as King; when the latter abdicated in 1873, Castelar became Minister of Foreign Affairs to the Republic, and in September of that year he was made President. His measures for suppressing the Carlist insurrection and for harmonizing conflicting interests did not succeed; on January 2, 1874, he resigned, Serrano came to the front in the military reaction, and a year later, when Alfonso XII. was called to the throne, Castelar made a second journey to Geneva. In 1876 he reëntered the Cortes; he has since taken an active part in the political debates. To a history of the Columbus epoch he brings scholarship of a special character; the chair of History and Philosophy at the University of Madrid was filled by him for many years until he resigned it in 1875. His democratic principles and his admiration for American institutions have served to keep him in sympathetic touch with the civilization of the New World.—THE EDITOR.

# CHRISTOPHER COLUMBUS.

BY EMILIO CASTELAR.

## I. THE AGE IN WHICH HE LIVED.

**T**HE name of Columbus suggests mysterious analogies to all those redeemers who owe their influence on humanity, and their renown throughout the ages, to suffering and sacrifice. Fortunate, thrice fortunate was the Genoese mariner in the attainment of his ambition. While yet in the full maturity of his powers, long before the infirmities of age had begun their blighting inroads, he lifted the veil from a new and beautiful world. True, after Columbus had brought America to light, he did not grasp the significance and full extent of his achievement; nor would blind fate consent to the linking of his immortal name with his discovery, reserving that well-earned honor to a pilot of inferior merit. But, as if to make amends for this, he leaves in the background of fame all other navigators whose names are written in the priceless annals of discovery.

The first wanderer who quitted the watered valleys to seek a new existence amid the sands of the desert; the first frail bark intrusted by human daring to the surging billows; the Phœnician explorer who first grounded his ship on the shores of Carthage; the wary son of Hellas, forced to flee from the reefs against whose hidden rocks vessels were dashed in pieces, and to cover eyes and ears, that he might return to his native land and not linger forever in idle harbors and along smiling shores; the hotly pursued searcher for the Golden Fleece—all who by means of perilous expeditions have brought to light unknown races, or established communication between remote races, stand grouped yonder in the shadowy outlines of the early dawn of the historic ages.

When Columbus, greatest of discoverers, appears at last, in an era when the intellects of men are ripening, and when mind and nature are becoming reconciled under the influence of religious and scientific reformation, his personality stands out in such exact proportions, drawn in colors so bright, that it can never be confounded with another, or be hidden behind the glamorous mists that hang around other prominent historic characters, who, less fortunate, have never, with all their worth, risen so high as Columbus rose, nor won what he won—universal remembrance and recognition.

I attribute the historical good fortune of this portentous hero to his martyrdom; or, in other words, to the virtue and efficacy involved in the nature of suffering. That persistent struggle of the discoverer with superstition, prior to his wonderful success, and that other struggle, after his wonderful success, with his own errors and with ingratitude, encircled his brow with a crown of thorns, of which every barb that pierced his temples while he lived became

STATUE OF CHRISTOPHER COLUMBUS ON THE MONUMENT AT MADRID.

at his death a shining ray of glory. At the foot of every altar lies a sacrifice.

The fabulous aspects of his career became almost incredible. Beholding how Columbus stored his mind with all the gathered knowledge of his day; how he urged before universities and learned men the indispensable adoption of his plans, based in part on his personal conjectures and in part on his experience and his researches; how in all that time of steadfast preparation he staked his hopes upon magnates, archbishops, monks, and potent queens and kings; how learning and calculation entered into his plans as much as intuition and genius, many pious souls professed to discover therein revelations such as God made of old to his prophets, and proposed to the Church his canonization. I attribute such exceptional treatment of Columbus to the fact that discoveries and discoverers exert a potent influence upon the imagination; and yet they hold a lesser place in popular history than statesmen or warriors. How much more important would it be in our day to know who invented the flour-mill than to know who won the battle of Ar-bela! The fact is that, comparing the volumes devoted to statecraft and to war with those treating of labor and industry, one is astounded and dismayed at the incredible disproportion. I can understand why this should have been so in ages when manual toil was considered degrading, and when trade, relegated to the common sort who were politically debarred from coping with the patrician classes, was despised. But even in our day, transcendently the age of labor and of industry, while the names of great commanders are borne on the world-wide wings of fame, those of discoverers fall with the utmost ease into ungrateful oblivion. For one Galvani, one Franklin, one Daguerre, one Edison who has spread his renown among all classes and stamped an invention forever with his name, what a vast number of unremembered or unknown glories!

The peoples of the future will not be so ungrateful. The first years of this century will grow in universal remembrance, not by reason of those Napoleonic victories whose godlike renown a thousand poems sing, but rather because of another and better title to glory—the voltaic pile, imprisoning the all-diffused electric fluid, and by its chemicals and metals engendering currents and forces as though it were a microcosmic universe, an epitome of the alchemy whereby the great powers of nature produce and maintain life. Without the astrolabe, invented by the Arab schools of Cordova and Seville for the study of the heavens; without the science of algebra, so greatly facilitating the labor of calculation; without the mariner's compass, which fixes a sure point to guide the

bark lost in the infinitude of sky and sea; without the printing-press, which within a short half-century after its invention had already become a potent auxiliary to the development of the human intellect, the discovery of the New World—itsself the logical result of a slow but sure evolution, wrought out in successive stages like all great human achievements, and not by sudden chance—could never have taken place.

A LITTLE before the middle of the fifteenth century, about the year 1433 or 1434, Columbus was born at Genoa. Nature and Providence joined in willing that so sublime a mariner should be brought forth and reared on the shores of the sea. From the earliest times the true historic centers of civilization and culture have been associated with places situated on or near great waters. Survey the world of history, and you will discern what an intimate relation has from time immemorial existed between river-courses and the formation or transformation of States. The Indus and India; the Euphrates and Chaldea; Israel and the Jordan; the Pharaohs and the mysterious Nile; Carthage and her harbor on the African coast of the Mediterranean; Tyre and Sidon, founded on the spot where the three continents of primeval earth seemed to converge; Greece with her sculptured shores and groups of islands redolent of song; Italy with her peninsular formation in the center of Europe and the southern sea; Spain set between the billows of old ocean and the Mediterranean furnish by their respective fluvial or maritime situations a perfect key to their strange and complicated histories.

The fact cannot be ignored that as there is a kinship in art, like that between all the Dutch and Flemish masters of the Germanic schools, so likewise is there a kinship between all the Italian painters—Florentine, Milanese, Roman, Venetian, and Umbrian. And like this affinity of the northern and Italian masters, so is there kinship between all Mediterranean mariners. So, therefore, Columbus belongs exclusively to the Mediterranean type of kinship by the happy union of inspiration and self-interest, which makes of him at once a trader and a prophet, equally capable of obeying the stimulus of gold like any sailor who roams the sea for commerce, for barter, and for the ignoble lust of gain, or of obeying the summons of religious faith like some old crusader. In the Norman sea-rover you always behold the mariner. In the Mediterranean sailor you behold, joined to the selfish interests of industry and traffic, the religious enthusiast, the prophet and the martyr. Let no man undertake to analyze Columbus who will not recognize how absolutely these two extremes meet in him.

It is a historical fact that the fifth, the tenth,

the fifteenth, and the nineteenth centuries are the four great periods of transition. Who can doubt that the fifteenth century was one of those predestined to bring about radical and profound changes? Paganizing influences were stealing over the pontificate, to such a degree even that the popes seemed to be high priests of Jupiter and religion itself an art, a plastic art. Poets, painters, sculptors, true ministering spirits of this new heaven, reawakened the olden gods amid the scenes of nature, and revived the ancient idolatry beneath the arches of the churches. The empire became a mere empty show; the German kaisers seemed to be little more than bespangled and unreal players; feudal society fell, overthrown by the successful power of labor. The ancient Lombard leagues, the old military framework of society, and the outworn feudal States were succeeded by the dominion of the mercantile cities, whose fleets were such as empires never owned, and who rewarded their artists as emperor never did. These cities made use of their garnered wealth to convert the palaces of their guilds and corporations into museums, and, resting from their world-wide barter, devoted their whole existence to continual artistic tourneys, Olympic games, and poetic contests, in which the days of ancient Greece seemed to be revived, and the Muses who perished at the feet of Hellenic altars to be once more restored to our world. This fifteenth century is the springtime of modern history. Industrial art brings forth the printing-press, which helps to immortalize the thoughts of men; old ruins crowned with the wild thyme and rue give up, like the tomb, their treasure of life, the perfect statue that affords a type for the perfection of new-born art; the dry shell of scholastic philosophy produces, like some bright insect, the pure Florentine Platonism, and finally the ocean, in order that all may be marvelous, that all may be regeneration and progress, brings far-off America to light, renovating nature itself, as by another and greater miracle, with her virgin forests and her fullness of life.

This age of the Renaissance seems to have delighted in satisfying every need and aspiration of the spirit of man. A means was required to rend and crush the feudal rock, and gunpowder appeared in the fourteenth century. To lay bare the secrets of the planet, to accomplish the legendary voyages of the new Argonauts, a fixed point in the sky corresponding to another fixed point in the ship was demanded, and the mariner's compass was providentially vouchsafed. A new type of art was required, and the long-forgotten statue came forth to hold the post of honor in our cathedrals and in the palaces of our popes. A new social organization was demanded, whereupon the municipalities arose to institute democra-

cies, and monarchies to organize states. A new sense was needed to pierce the further heights of heaven, even as the printing-press had vanquished devouring time and the compass conquered space, and straightway the chance dropping of a few bits of glass into an organ-tube revealed the telescope and overthrew the senile astronomy of Alexandria. Conscience, too, needed to be renovated; the Church to be reconstructed; Christianity to be reformed, and the beliefs of man idealized. And to fulfil this mission without abandoning the traditional ideas and dogmas of the faith, the strong intellect of the immortal Savonarola and the reformatory doctrines of Luther were brought forth. So, too, nature must needs be new-born, and Columbus appeared. Examine the record of all discoveries and inventions, and you will see how that of the great mariner makes its advent in the appointed hour, when our earth and our intellect demanded it with one accord.

An event took place in the century of Columbus which aroused the minds of men and overwhelmed their souls with dread. Constantinople, the holy city, set at the very portal of Asia, found herself suddenly surprised by the hordes which had escaped three centuries before from the Mongolian plains, and was forced to bow beneath the yoke, like Jerusalem of the prophets, until the crescent replaced the Christian cross upon the minarets of Saint Sophia, and the muezzin uttered his cry where hitherto the priest had offered his prayer. This great empire of the East had endured for eleven centuries; yet in its agony it held aloof from the West, and from the West received no succor, merely on account of wretched theological controversies. It is impossible to conceive how potently and imperiously Columbus was inspired by that other semi-religious impulse of a new crusade, except by sharing the impression left on his soul and the thoughts aroused in his mind by events like the taking of Byzantium, mourned in the chiefest elegiac poems of the age. In like manner as the yearning for a new life and new discoveries filled the minds of men in that Easter-time of the Renaissance, and as the desire to revive the crusades was excited by the fall of Constantinople, so the zeal for traffic that possessed him had its origin in the mercantile cities of Italy; the desire to seek commercial gain through great maritime expeditions originated in the marvelous spectacle of the Portuguese discoveries of that time; the resolve to essay fabulous and impossible deeds sprang from the successful end of that great campaign against the Arab invader, accomplished after seven centuries of effort by Spain on the beauteous Vega of Granada.

But our principal need, in order to understand

one of the phases of the mind of Columbus, is to study the mercantile cities of Italy at that day. None was so active as Genoa. By its internal constitution it ranked among the republican municipalities, in which upon a solid basis of genuine democracy there was often reared a certain noble class; not, we may say, of true election, but of true selection, charged by common consent and by long usage with the functions of direction and government. But the Genoese democracy had become split up into such a number of factions, and so many leaders had arisen among its nobility, that Genoa was compelled to deliver one of her fortressers to the Duke of Milan; in order that, by maintaining a garrison and a standard there, he might impose upon all the mutual respect and consideration due among free and genuine citizens. And as in the commercial republic of the Carthage of old foreign mercenaries were employed, and as in the no less commercial monarchy of England there exists even in our day a hired soldiery, so in those mercantile cities, in accordance with the axiom that nature produces the thing of which she stands in need, there was evolved a class of soldiers of fortune, who offered their swords to the highest bidder, in return for favors or money, for the defense of any principles and any cause. Thus, and only thus, in those terrible ages of everlasting war when civil discords often coincided with foreign discords, could governing families arise like the Medici in Florence or the Dorias in Genoa; or manufactories be established for the fabrication of countless products that even to-day amaze us; or the exchanges of commerce be effected as a stimulus to labor; or a peaceful existence be assured to the tillers of the soil, who were exempt from all other service provided they would give the proprietor one half of their crops; or the lyre resound, the canvas yield to the brush, the marble to the chisel, and the rough stone be wrought into the stately piles of those splendid cities, filled with bright colors and vocal with the chants of triumph. The gorgeous churches of Genoa made of Columbus a crusader, its schools a geographer, its palaces filled with paintings and statues an artist, its shores a mariner, its industries and commerce a shrewd calculator and thoroughgoing man of business.

In the same way as Genoa must have exerted an influence upon the character of one like Columbus, so also Pavia, the university-city, to which his parents sent him in his early youth, was calculated to influence his psychological and moral nature. In truth, the universities of that time took rank as great intellectual capitals and as centers of converging ideas. Columbus, after three years' residence, abandoned the university; and we may there-

fore disregard its possible influence when we endeavor to follow out and estimate the various developments of his mind. From a very early age, like all those who are under the sway of a sovereign vocation, the great pilot took the highest mental delight in the study of geography and charts, while his principal physical occupation was in the combats and perils of the sea.

Although the story of the youth of Columbus, after all that is known of it has been scrupulously sifted, can hardly be vouched for as historically certain, mixed as it is with a thousand wild traditions originated after he had become famous, and mainly due to interested kinsmen, or resting on mere tales devised to fit his career and his achievements, it cannot be denied that he was indeed a part of the stormy maritime life of his time. John of Anjou, Duke of Calabria, took Columbus with him in the fleet of galleys sent to win the Neapolitan throne for René, Count of Provence. And in these expeditions he made good use of the two great virtues of the true sailor, courage and sagacity. Columbus himself tells that when René sent him to Tunis in search of the galiot *Fernandina*, and when, in the neighborhood of San Pietro in Sardinia, the crew mutinied and sought to force him to set sail for Marseilles, he contrived, under cover of the darkness of the night, to change his course, so that at day-break the mutineers found themselves, against their will and without having suspected the trick played upon them, within sight of the headland of Carthage. It need, therefore, seem to us no great thing for him to have sailed from Cyprus to Lisbon, and at last to have passed, in the prime of life, about the year 1454, to the dominions of Portugal, a nation much in harmony at that time with the propensities of his temperament and with the dreams of his far-reaching imagination.

Although the fame of Columbus would rightly seem to stand alone and incontestable in human annals, it has in reality been one of the most contested. The erudite advocates of new-fangled theories appear to think that the highest merit in their trade is to dispute the indisputable: and so some of them attribute to the earliest Icelder they come across in the sea-legend of ancient Scandinavia the discovery that was made by Columbus; and some to the chance event of a direful shipwreck in the waters of Portugal, where Columbus was at the time, and to the tale whispered in our pilot's ear by a poor wrecked sailor who lay dying in consequence of that shipwreck and of his bitter sufferings. In Spain, where the most familiar proverbs are instinct with the highest philosophy, when one is persecuted by the breath of slander or calumny he is told, by

way of consolation, that "they would say it of God." It is impossible for Columbus to be exempt from the common lot that befalls our shortcomings and chance acts. Many concurrent causes explain this contradictory judgment in regard to a personality so distinct in itself and so positively historical. At the beginning of the century, and indeed far into it, history was largely governed by a diseased standard of criticism, which mistook scurrility and censoriousness for healthy judgment, much as though in the domain of justice the judge were to be confounded with the hangman. In the second place, it has been the fate of our generation to undergo a dismal succession of reactionary movements, outdoing each other in extravagance and unexpectedness. The ultra-reactionists of our religion had long felt the need of new saints to renovate their time-worn calendar; they hunted far and wide to find some personage possessed of the gift of miracles, and finally they set to work to proclaim the impeccability of Columbus, and to raise him to the category of the immaculate conception as being without the stain of original sin. In order to confer, with any show of reason, the saintly title upon him, the Ultramontanes exaggerated his domestic virtues; while on the other hand the opposing rationalists dragged him in the mire by their merciless attacks, not so much with intent to degrade the man himself as to open the eyes of the devout to the facility with which the Church can swallow anything when it sets to work to make, for its own advantage, a popular and miracle-working saint. The upshot of this scandalous quarrel went to prove that Columbus sinned in his love-affairs and in his pecuniary transactions, that he was a greedy adventurer, and that he was fond of gold and sensuality. None of this would ever have been thought of had due heed been given to what the immortal pilot really was — by atavism, by birth, by vocation, by natural bent, by education and by the whole tenor of his life. What, then, was he in truth? Columbus was, purely and simply, an Argonaut.

Our Argonaut is seen to be very complex when contrasted with him of old. The minds most difficult to comprehend are the most complex. Columbus, seer and trader, visionary and calculator, crusader and mathematician, a sort of Isaiah in his prophetic insight and banker in his computations, his thoughts set upon religion and business alike; a sublime oracle from whose lips predictions fall in impetuous torrent, and a singularly bad governor, resorting to irregular and arbitrary measures; advocating the reconquest of the Holy Sepulcher through a mighty effort of his devout will, and of the mines of Golconda by a shorter road to India than any then known; ever in suspense between lofty

ideals and idle fables; able to create a new world through the strength of his intellectual vision, only to ruin it forthwith by his improvident schemes and his wretched administration; mathematician and soothsayer; believer in magic and student of nature; mystic and astronomer; so multiplex and various are his traits that they scarcely come within the grasp of any logical chain of reasoning. He who regards not the supplications of Columbus, his visions, his predictions, his schemes of evangelization, his dream of winning back the Holy Sepulcher and his irrepressible tendency to oracular and prophetic utterances, ignores a most important element of his being; but he who leaves out of sight his Italian refinement, his Genoese shrewdness in trade, his fifteenth-century diplomacy, his inordinate thirst for wealth, his stratagems in seamanship, his Florentine duplicity as a schemer, his propensity to sell himself body and soul to the highest bidder, his continual bargaining, ignores on the other hand an aspect no less singular than the first, and of no less decisive influence toward the accomplishment of his great end, and toward the realization of his marvelous achievement. What a strange mingling of science and sorcery he appears to us; now wholly a philosopher, like Copernicus, his contemporary; now a knight-errant, like those depicted by Pulci or Ariosto. At one moment you would deem his mind stored with the most perfect astronomical tables; at another you would hold out your palm to him that he might read your horoscopé by chiromancy. There is in him somewhat of those positive algebraists of Cordova who revived the mathematical sciences by their own researches and by the aid of Alexandrine traditions, as there is also something of the alchemists who found, not gold indeed, but chemistry, the peer of gold, in their retorts. And all this is in him and of him, for with him the middle ages end and modern times begin.

We must not be misled by the magnitude of the event to imagine that the advent of Columbus and the discovery of the New World were sudden happenings, unheralded by the teachings of science or by the evolutions of time. As the productions of Central Asia tempted trade and barter in those days, so likewise did minds of a certain type and class devote their unflagging energies to seeking the shortest possible pathway to that miraculous fountain-head of wealth. The whole world dreamed of India, and therefore all explorers sought the Indies by way of every sea. The ancient Fleece of Gold was revived in the tomes of the Venetian, Marco Polo, which were written in haste and spread among the people as no book had ever spread before. In her eternal rivalry with Venice, Genoa, the home of

Columbus, spurred on by the lust of gain, explored land and sea in every possible direction. The embassies despatched by Henry III. from his Castilian realms, of which Clavijo tells with such delightful ingenuousness; the pilgrimage of that adventurous Venetian, Nicolas Conti, undertaken in the lifetime of Columbus; the swarm of explorations chronicled by countless explorers did not, like the crusades, obey a religious motive and purpose; they were solely instigated by mercantile interest, and sought markets, not tombs. Coincident with all this was a greater zeal and persistence in geographical research. Chartography thrived most remarkably. The barks of Catalonia, in their civilizing mission along the Mediterranean strands, carried tolerably correct charts of the world as it was then known, planned in those splendid centers of culture, Barcelona and Mallorca. The genius of glory will give an eternal place on her roll of fame to that Catalan chart of the world, called in every scientific treatise the Great Map, and drawn in the seventy-fifth year of the fourteenth century, for which reason that year is to be counted among the most brilliant in the pathways of time, and among the most sacred memories preserved in the annals of the world. The terrestrial planispheres so graphically instructed the sailor that they might almost be termed text-books, showing how closely the great and marvelous discovery of the mariner's compass had been followed by man's domination of the sea. In this wise the planisphere designed in the library of the Borgias, and the chart traced by the monks of San Michele on the walls of their monastery in the lagoons of Venice near Murano, both of which were constructed in the time of Columbus, summed up and exhibited all the chartographical knowledge of that day, and gave practical teaching in geography, with all the accuracy then possible, to the travelers and explorers of that most eventful age. But the richest store of the knowledge so essential to his mission and his profession was, perhaps, found by Columbus in Genoa, at that time as celebrated as Barcelona and Palma for its maritime charts. They were called by the same Greek name, *Periplus*, which was rendered so famous by the cruise of Hanno the Carthaginian. Vivien attributes to the Genoese, Pietro Vasconti, a very skilful navigator, the first periplus constructed in the middle ages. The charts of Pizzagni, of Bianco, of our Balearic countryman Valseca, served not alone to perfect Columbus both in his calling and in his knowledge; they likewise helped to win for him the means of subsistence, for he copied them and sold them after he had made use of them in his own voyages. An examination of these charts at once reveals indefiniteness and

blank spaces in regard to seas other than the Mediterranean, which was then as well explored and known as in our own times. In addition to all this, the first fruits of the printing-press were seen in the publication of various works on astronomy, cosmography and geography. By a thousand different roads learning had reached its apogee. Then it was that Columbus, deeming the Mediterranean too narrow a field for his genius, took his way, we know not now whether in obedience to deeply reasoned motives or to some swift inspiration, to the extremity of the Iberian peninsula,—to that Portugal which was then exploring Africa and bringing oriental Asia anew within the range of life and history,—to fulfil his design of rounding and perfecting all this by the discovery of America.

THE harmony between the individual vocations of men and their destinies cannot be ignored. Columbus would not have ranked among the foremost of navigators but for the influence of Lisbon; that city whence voyages first were undertaken upon the high seas, which as far excelled in effort and extent the petty Mediterranean cruises as the latter exceeded the ancient navigation of rivers. Columbus the Genoese went to Lisbon; for there was the fane of science, and all roads then led to the mouth of the Tagus. From the Normans to the Mallorcans, all sought at Lisbon opportunities of commerce and nautical instruction. And this decision of his, reached by deliberate and conscious reflection, was inspired by the inward voice, ceaselessly heard, of earnest thought moving him and guiding him in his work. It was not a mere chance, as those historians hold who see him cast upon the Portuguese coasts by destroying tempests and fatal shipwreck.

The relations between the western cities of the Italian peninsula and the western cities of the Iberian peninsula during the middle ages appear to have been very close. This contact of Catalonia with Italy explains how heroic men like Roger de Lauria became admirals of Aragon; the dominion of Charles V. over continental Europe explains how the office of high admiral of Spain was filled by a Genoese sailor, Andrea Doria; the presence of the Genoese in Galicia and Portugal is explicable only by the high reputation won by the Genoese among the Galicians and Lusitanians. Certain it is, as Oliveira Martins, the great Portuguese historian, declares, that in seamanship Genoa held the mastery over Lisbon. In fact, in the eleventh century, the bishop of Compostela or Santiago procured pilots from Liguria; and later, so wise a king as Dom Denis of Portugal bestowed the Portuguese high-admiralship on the illustrious

Genoese family of the Pezzagnas, and made the rank hereditary. So many foreigners dwelt in Lisbon in the fourteenth and fifteenth centuries that its chronicler calls it a vast city of many and widely diverse inhabitants. It differed from Venice, where three elements predominated — the Greek, the Slav and the Latin. It must rather have been like such modern cities as Buenos Ayres, New York, and many others of America, peopled by immigrants from the four quarters of the globe. To me, Lisbon exerts a decisive influence on the mind of Columbus, and invests it with the traits of universality which Lisbon had possessed from the fourteenth century, and with that dreamy farsightedness that kept it in a perpetual fever of illusion and anticipation. Beholding the ships of every port, associating with men of every clime, hearing the accents of every tongue, taking part in the barter of the wares of all countries, breathing the spirit of all peoples and brought in contact with the large results of universal commerce, a comprehensive and brilliant intellect — one which assimilates converging currents of ideas — molds all into a supreme and universal whole.

The world was growing broader under the influence of Lisbon, and the mind of man was expanding under the influence of a widened sky and earth; while, beyond a doubt, ancient interests and beliefs were dwindling in proportion to the world's advance and the growth of human intellect. As modern astronomy has dethroned our planet from its station as the center of the universe, where it was set by the superstition of old times in obedience to the evidence of the senses; so the ascendancy of Lisbon was lessening, little by little, the influence of Venice and Genoa, in like manner as the discovery of new regions and cities was perforce to lessen in the course of time the sovereign influence wielded by Lisbon in the last years of the middle ages.

There is a mysterious relation between the art-schools of the Renaissance, founded by the Medici in Florence, and the schools of practical seamanship founded by the sons of Dom John I. at Cape Sagres. The academies on the banks of the Arno looked backward to the past, while the schools by the ocean's side looked toward the future. In the former prevailed the inward astronomy of the thoughts; in the latter, the outward astronomy of the heavens. As the Florentine artists were destined to revive the world of history and tradition, so was Columbus destined to reveal the world of nature and of liberty.

The whole of the Lusitanian fifteenth century is filled with the universal aspiration to search and dominate Africa, giving rise to daring voyages and explorations more or less

continuously carried on. The Azores and the Guinea coast, discovered after so many futile attempts, were to the imagination paradises while sought, but proved to be but untilled wastes when found. Turning from the new-found Azores and the western shores of Africa, desire ardently sought to win a foothold on the African continent itself. This desire was personified in the infante Dom Henry, the third son of the king Dom John, belonging to the dynasty of Aviz, successor to the Burgundians and forerunner of the houses of Austria and Braganza, a dynasty that began in Castile with a half-learned, half-feudal noble, and ended with that sublime madman the king Dom Sebastian in the war against the Moors for the coveted sands of Africa. Henry seemed to be not a man, but a cipher. No human passion swerved him from his providential and historic aim. A persistent yearning for voyages filled his breast, and wholly subjugated his will to his ideal. The measureless ocean that stretched at the foot of Cape Sagres was for him crowded with the same fantastic objects and the same idealized visions that his inward soul discerned. Portugal, hemmed in on the landward by the power of Castile, had no resource but to turn to the ocean for broader dominion. Her material growth and her intellectual progress demanded this. Dom Henry, being a Lusitanian, was a born discoverer. This vocation, due to the paternal stock, was fortified by the powerful influence of the maternal line. The mother of Dom Henry of Aviz, being of English birth, was both Saxon and Norman by temperament. Her name was Philippa of Lancaster. Until well advanced in age she bore to her husband, the king Dom John, a child every year. This offspring turned to the sea spontaneously, like aquatic creatures seeking their element; and, being good princes and kings, they aspired to conquest. The infante Dom Henry, therefore, by the double force of his will and his intelligence, imposed an African conquest upon his people, deeming that he might thus penetrate by land to the dominions of the Great Mogul, and become enriched by his measureless store of pearls and diamonds. Cathay, the palacety, described in all the legends of that time; paved with silver and overlaid with beaten gold; perfumed by odorous waters flowing from fountains of mother-of-pearl and giant opals; crest-crowned by pinnacles of rubies and emeralds; with agate turrets and porphyry walls, upon which seed-pearls fell in gentle shower, rose in a dream-vision beyond the Strait of Cadiz, beyond the Isthmus of Suez, beyond the Arabian deserts, away in far Mongolia where Alexander the Great effected the transfusion of blood from vein to vein among his warriors, and brought about a blending of races whereby

the way was prepared for the moral unity of the human race.

The ruling passion, the idea that excited the mind of Columbus and tyrannically possessed him, was diffused throughout his time. Without those mirage-like and fanciful imaginings, and without the delusions born of fable, never would the other hemisphere have been discovered from our own, and never would the Old World have been completed by the New. Besides all this, Portuguese navigation was attaining such a degree of perfection through the application of the astrolabe to seamanship, and the improvement of the compass, that coasting-skiffs were becoming sea-going vessels and were venturing out upon the boundless deep.

When Columbus reached Portugal, he at once found himself in the midst of excited schemes of daring voyages and innumerable discoveries. To grasp all Africa, and after Africa all Asia, was the one idea that throbbed in Dom Henry's soul. For this he stood ready to sacrifice all earthly things. Handsome, powerfully built and refined, he was to know neither love nor family ties. That heart of his could love only his marvelous Africa. His indomitable will was to leave no offspring save numberless discoveries, half trading-posts, half colonies. So, therefore, the image of Ceuta appeared to him nightly, for Ceuta meant to him a breach through which to seize the Libyan desert and subjugate Morocco. After long nights passed in dreaming of Ceuta, he spent his days in reading the descriptions of the coveted city given by the Arabs.

After having conquered Ceuta he attempted, against the advice of all his followers, the conquest of Tangiers. Certain it is that the irreparable disaster of his life there befell him, and caused the martyrdom and death of his brother Dom Fernando, the hero of Calderon's immortal play "The Faithful Prince," which is regarded by Schlegel as the finished and perfect prototype of the Catholic drama. Defeated before Tangiers, he was forced to promise the restoration of Ceuta to the Sultan of Fez. As a pledge of such restoration, he had to deliver his brother Dom Fernando as a hostage. But humanly it was impossible for him to restore Ceuta. Of no avail was the death of his mother, whom he tenderly loved, and who, in the agonies that preceded her end, gave him the crusader's sword and the reliquary of the true cross. Even before her funeral obsequies were over, he celebrated, in rich attire and with endless rejoicings, the festival of his embarkation for Ceuta. Of no avail was the bondage of his brother to the Moors of Fez and their demand for Ceuta as his ransom; he may suffer martyrdom and death at their hands, but Ceuta shall not be lost to Portugal. In vain was his defeat at Tangiers; he renewed the attempt

against the express wish of his brother the king Dom Duarte, who, less inspired and less great but gentler and tenderer, was doomed to die of grief as the blows of the martyrdom of Fez echoed in his pitying and lacerated heart. As the falcon watches its prey, seeing no other creature or thing, so Henry watched his distant lands from Cape Sagres, beholding nought beside.

The longing to discover other and yet other races had then a firm hold upon all minds. The infante, Dom Pedro himself, made a two years' pilgrimage to Cyprus, to Constantinople, to Cairo, to Mount Tabor, to Golgotha, and to Sinai. Take away from Dom Henry of Aviz the exclusiveness of his natural calling and his intellectual self-concentration, and he would not stand forth in history as the highest and first of the Lusitanian discoverers, among whom shine the glorious names of Vasco da Gama and Albuquerque. For by his exertions there were discovered for Portugal, upon the known African continent, Ceuta; on the untrodden Gold Coast, Sierra Leone; between the African and European shores, clusters of islands such as the Azores, and greater islands such as Madeira, seeming in their vegetation and fruitage like the loveliest of Asia; on the coast of Africa itself other isles, as those of Cape Verde; and besides all these was soon to come the doubling of the Cape of Good Hope.

They who regard history as made up of miraculous chances attribute, as we have seen, to a disastrous shipwreck the coming of Columbus to the Portuguese kingdom; and his good luck in finding out new tracks upon the seas, and in happening upon unknown lands, to his having won the confidence of other shipwrecked seamen, led by accident to his hearthstone. And they have wholly erred; as all those perforce must err who rest their belief upon unlooked-for and abrupt improvisations in human affairs.

The presence of Columbus at Lisbon is like the presence of artists in Rome and archæologists in Athens. Mathematician, skilled mariner, navigator and pilot, the Mediterranean must have seemed straitened to his generous ambition, and he turned to the ocean. Reared in those Italian cities which gazed toward the Orient and the past, he came, perforce, hither where by a providential law the eyes of men looked to the West and the future. This was the paramount cause of his seeking Lisbon, but the incidental motive was the sojourn of his brother, Bartholomew Columbus, among the Portuguese. Very open to criticism are all the biographical dates in the life of Columbus before his achievement won him such high renown and world-wide fame; but we must assume that he arrived three or four years before

the good Dom Henry passed from this mortal life to the life eternal. So fortunate a coincidence permitted him to learn the use of the quadrant, invented by our mariners as an auxiliary to the compass, and the application of the astrolabe to seamanship, an innovation by means of which vessels were enabled to quit the coast and shape their course out into the infinitudes of the sea; to witness the intrepidity with which the explorers who put forth from Cape Sagres had doubled the promontory of Bojador, supposed to be the extremest verge of earth; and to admire the western caravel, small but so nimble that, in the words of a famous Portuguese, its lateen sails seemed like sea-gulls' wings and its hull like a fish, light of draft for sailing on the coast and in shallow waters, but strong and stout to encounter the waves and gales, an indispensable instrument for the lofty task of exploration and discovery. Besides all this, no doubt now remained as to the sphericity of the earth. And, the earth's shape being no longer in question, neither was there doubt with regard to the coessential conviction that the lands of the Orient would be reached by sailing westward. And, there being no doubt whatever on this point, so also could there be none that neither the Azores, nor the Cape Verde Islands, nor Guinea, nor any spot yet discovered by the Portuguese, could be the last western extremity of our globe.

Admirable and profoundly true as all these propositions were, they did not, however, contribute in so marked a degree toward the enterprise of Columbus as did a paramount error — that of supposing that the world was much smaller than it is. He did not accept the popular ideas of his time concerning the Antipodes, which orthodoxy and tradition held to be impossible. He gave no heed to those who denied the rotundity of the earth because the prophets had likened the canopy of heaven to the roof of a tent. But he believed in the dimensions assigned to the world by Ptolemy; and, being possessed with this idea, he believed that there must be very little sea, and, therefore, but a short distance between the extremest discoveries of Portugal and the East Indies. Inwardly assured of all this, and firm in his resolve to demonstrate its truth, he went about beholding all things around him, and by observation confirming his intimate convictions. To illustrate: the teachings of Jaime of Mallorca; the charts of our Valseca; the report of one Vicente, who averred upon his soul and in God's name that he had found wooden carvings of a strange fashion unknown among the ordinary industries; those giant reeds mentioned by Dom John I., the great size of which opposed an invincible obstacle to all attempts to navigate the shadowy sea; the terrestrial globe

of Behaim which depicted the fabled Atlantis on the very spot where Columbus placed the East Indies; a thousand such details, many of them lost to history but all coincident with the focal center of what we may term the Columbian idea, made up the boundless nebula in the depths of time and space, from whose bosom was evolved, like a glorious sun, the wondrous discovery. Impossible it was, impossible from every point of view, to ignore the more or less certain indications that swarmed on every side. Some told how they had seen the corpses of human beings in form and color wholly unlike the races of men then known; while others told how they had sighted floating pine-trees, very different from the pines of Europe. Certain ship's-boys asserted that they had gathered upon western islands handfuls of sand for the galley fire, and had found it nearly all pure gold. The pilots added to all these glamors of the imagination and of desire by tales, more or less probable, of phenomena more or less real. Those who had sailed the Icelandic seas were unanimous in agreeing that thousands of signs announced a western land, toward which they had shaped their course a thousand times, but had ever been driven back by irresistible hurricanes let loose upon them.

A man born in Genoa, reared on the Rivas, taught seamanship from childhood, familiar with the Mediterranean, accustomed to deduce natural laws from the observation of facts, versed in every branch of nautical knowledge, coming in the prime of life to the immense trading-mart which Portugal had then become, possessed many a touchstone to test the native faculty of analysis, and to cause him to heed the commands and obey the impulses of his providential calling. We cannot, then, accept the fable, told by Herrera and by Oviedo, which attributes the voyage of Columbus to information obtained from a pilot of Palos, who, driven by a gale, landed upon the New World, and, after noting the features of the coast, and measuring the elevations, and calculating his latitude with profound wisdom, came back with the greatest secrecy by way of Portugal. Here, upon his return, having met Columbus upon one of the Portuguese islands, and feeling that death was near because of his exhaustion and his toil, he recounted the treasures of his knowledge and his experience to the Genoese, who, enriched thereby, was thus enabled to carry into effect his long-cherished plan. It is scarcely necessary, after mentioning all this, to add that it lacks historical foundation. It is based upon no written record whatever, upon no document admissible in evidence, nor upon any trustworthy testimony. Wherefore we see that these historians simply repeat the tale without vouching for it, and that it rests on mere fables,

with whose venom popular envy ever seeks to detract from merit.

Had Columbus possessed this legendary evidence in support of his scheme, he would not have hesitated as he so often hesitated; he would not have endured the pangs that tortured him through the weary space of twenty years; he would not have groped as he did in so many paths; nor have made so many proposals; nor have relied upon the arguments of intuition and science. It would have sufficed to have collected the proofs of his assertions, the various papers left in his hands by the blind confidence of a friend, therewith to overcome the general incredulity that so tenaciously and inimically thwarted his colossal schemes. Some practical and tangible proofs of what he maintained, some probable indications, some evidence with a glimmering of reality were demanded of him a thousand times; yet never was he able to present them to the thousand commissions appointed to consider his plan. When before them he appealed at one time to the catholic faith, at another to scientific demonstrations; now as a philosopher, now as an enthusiast; taking shelter behind illusions and calculations, but ever without being able to base the fabric of his dreams and hopes upon any solid foundation.

Columbus did not merely study out his idea in Portugal. Being very poor, he was spurred on by the prickings of necessity to utilize his mastery of map-drawing as a lucrative employment. The biographies of Columbus relate that, not content with satisfying his own wants so far as he might by means of his handicraft, he hoarded up some slender savings to send to his aged father at home. Columbus allied himself by marriage with an Italo-Portuguese family. She whom he was to choose and take to wife was named Felipa Muñiz Peretrello. Originating in Plasencia, the Peretrellos came in the fourteenth century to Lusitania, where they attained to the favor then often bestowed upon Italian families by the Portuguese kings, who were desirous to contribute to the common work of the Renaissance with the assistance of the eminent masters reared in that vast academy called Italy. Senhor Peretrello was exempted from the royal taxes in the last year of the fourteenth century by the recognition in Oporto of his rank and station as a *hidalgo*. His name was Philipponne.

Dona Felipa Muñiz y Peretrello belonged to a noble house, associated with Dom Henry of Aviz in his explorations and discoveries, as well because of their family station as by the grace and favor of the Infante. Upon this family had been bestowed, as a reward for such coöperation, the island of Porto Santo, discovered by the well-directed efforts of the noble

and active company organized in Sagres. The origin and tendencies of her family explain Dona Felipa's knowledge, by intuition and education, by hearing and sight, of many of the things that deeply concerned her home circle, and, to some extent, of the condition and government of the islands. Laws like those which in chemistry govern the affinity of combining atoms in social intercourse produce personal affinities. The greatest of all discoverers was himself destined to wed the daughter of a discoverer. Columbus often went to mass on Sundays and other obligatory days. His residence in Lisbon being near the convent of All Saints, he resorted thither to perform his devotions, and in his assiduous attendance there it was his fate to be attracted by Dona Felipa Muñiz until he sought and obtained her in marriage.

The affection of Columbus for the young Lusitanian doubtless possessed practical features also, in view of the sailor's desire to live for the realization in his riper age of the work already fully planned in the latter years of his exuberant youth. Moreover, crediting his contemporaries as we should, the incomparable pilot displayed two traits capable of turning the head, I will not say of Dona Felipa Muñiz, but of every woman — eloquence and personal attractiveness. His manly grace captivated her sense, his eloquence her mind. Well-proportioned like all the Græco-Latin race, he had the fair color and light hair of the Saxon and the Slav, a very attractive feature among the dark-skinned and black-haired races. With regard to his eloquence, we must believe him capable of inspiring love, to judge from the easy transitions seen in all his writings, whether from popular speech to scientific language, or from scientific language to religious diction; elegant without effort in the first, profound without obscurity in the second, and impulsive without extravagance in the last. Be this as it may, Felipa Muñiz and Christopher Columbus were made one, in conformity with religion and law, in holy indissoluble wedlock. The year after their union a son was born to them, who was baptized in Lisbon and named Diego.

The first and most important results of this marriage to Columbus were that two of his wife's brothers-in-law exerted a signal influence upon his career; one at Palos, a small Spanish port peopled by hardy sailors, the other in Porto Santo, that island discovered, as we have before said, by the exploring expeditions organized by the infante Dom Henry, and bestowed as a fief upon the Peretrellos for reasons not well explained in history. The brother-in-law at Porto Santo was named Pedro Correa. He inherited the island by entail, because of its having been conveyed to Bartholomew Peretrello, the father of his wife and of Felipa, by

the congress and academy of Sagres. To this island, governed by his kinsfolk, Columbus was obliged to go soon after his marriage, in order to look after certain matters touching the family estate; and there, by the domestic hearth, he learned how there had drifted to those shores strange products of other civilizations, corpses of men of other races, plants of other floras, all differing widely from the common and characteristic types then known.

Certain it is that, besides the mental labors of Columbus in cartography, so favorable to an intellectual development of which the influences were brightly apparent everywhere around him, he repeatedly engaged in practical voyages, thereby gaining experience and training in the art and office of an accomplished navigator. Thus he sailed up to the extreme north, and down to the southern limit of the lands then known, visiting Guinea and Iceland. The scientific purpose of all these voyages is found fully set forth in the notes written by Columbus himself, which tend to demonstrate the inhabitable of the various zones of the planet far beyond the bounds assigned by popular superstition to the existence of human life. "I sailed," he says, "in the year fourteen hundred and seventy-seven, in the month of February, a hundred leagues beyond Thule Island, whereof the austral part is distant 73 degrees from the equinoctial, and not 63 as some say, and it is not within the line which bounds the occident, as Ptolemy says, but is much further to the westward; and to this island, which is as large as England, go the Englishmen with wares, especially those of Bristol; and at the time when I was there the sea was not congealed, but there were very great tides, so much so that in some places they rose twice in the day 25 fathoms<sup>1</sup> in height, and fell as much."

By reason of the loss and oblivion of certain

old traditions Columbus could not have been aware of the deeply rooted claim prevailing in Scandinavian waters and lands, that the unknown world had been discovered five centuries before the Columbian theories and projects. In truth, these cruises of the immortal pilot qualified him in a high degree for the project to which his will and his thoughts were pledged. Guinea and Iceland afforded the proofs he sought, and encouraged the undertaking upon which he was entering with such marvelous unity of purpose and object. Africa and Scandinavia! The sun's rays slanting level in the one, and beating from the zenith in the other; there, a sky laden with flakes of snow, and here, rainless and unputying; fields of ice like walls of crystal on the one hand, and deserts torrid as the embers of an oven on the other; the boreal fir-tree and the tropical palm; the reindeer, confined to the polar circle, and the dromedary, restricted to equatorial Asia and Africa; the ichthyophagist, devouring half-cooked or frozen fish, and the anthropophagist, delighting in human flesh; the fair-skinned and ruddy-haired inhabitants of one zone and the black and woolly denizens of another, all told him with one accord, by their contrasts, how the whole planet appeared to be inhabitable and, consequently, how the races of Cathay and the dominions of the Great Khan were to be conquered, contrary to all the achievements of man hitherto, by following the westward track. "I sojourned," says Columbus in his personal notes, "in the Castle of La Mina of the King of Portugal, which lies under the equinoctial, and therefore am I a good witness that it is not uninhabitable as men say." Thus, as one of the results of this voyage, the judgment of Columbus had already shaped his marvelous scheme, and had dissipated the main arguments against the solid foundations on which it rested.

*Emilio Castelar.*

<sup>1</sup> In Spanish, 25 *brazas*. (Las Casas: "Historia de las Indias," I., 48.) Helps disputes the translation, and, finding that in the extant Italian version the word is *brac-*

*chia*, claims that Columbus meant 25 ells, about 52 feet, and not 25 fathoms or 156 feet. But *bracchia* is Italian for a fathom, as *auna* is for an ell.—TRANSLATOR.

## A SEA GHOST.

ALL night I heard along the coast  
The sea her grief outpour;  
And with the dawn arose a ghost  
To haunt the furrowed shore.

And when from out the gray mist rolled  
The sun above the town,  
A shipwrecked sailor came and told  
Of how the ship went down.

Then did I sudden understand  
The sobbing of the sea;  
And of that white ghost on the sand  
I knew the mystery.

*Frank Dempster Sherman.*

## A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

XVIII.

HE palace on its red rock seemed to be still asleep as he cantered across the empty plain. A man on a camel rode out of one of the city gates at right angles to his course, and Tarvin noted with interest how swiftly a long-legged camel of the desert can move. Familiar as he had now become with the ostrich-necked beasts, he could not help associating them with Barnum's Circus and boyhood memories. The man drew near and crossed in front of him. Then, in the stillness of the morning, Tarvin heard the dry click of a voice he understood. It was the sound made by bringing up the cartridge of a repeating rifle. Mechanically he slipped from the saddle, and was on the other side of the horse as the rifle spoke, and a puff of blue smoke drifted up and hung motionless above the camel.

"I might have known she'd get in her work early," he muttered, peering over his horse's withers. "I can't drop him at this distance with a revolver. What's the fool waiting for?"

Then he perceived that, with characteristic native inaptitude, the man had contrived to jam his lever, and was beating it furiously on the fore part of the saddle. Tarvin remounted hastily, and galloped up, revolver in hand, to cover the blanched visage of Juggut Singh.

"You! Why, Juggut, old man, this is n't kind of you."

"It was an order," said Juggut, quivering with apprehension. "It was no fault of mine. — I do not understand these things."

"I should smile. Let me show you." He took the rifle from the trembling hand. "The cartridge is jammed, my friend; it don't shoot as well that way. It only needs a little knack — so. You ought to learn it, Juggut." He jerked the empty shell over his shoulder.

"What will you do to me?" cried the eunuch. "She would have killed me if I had not come."

"Don't you believe it, Juggut. She's a umbo at theory, but weak in practice. Go on ahead, please."

They started back toward the city, Juggut leading the way on his camel, and looking back apprehensively every minute. Tarvin smiled at

him dryly but reassuringly, balancing on his hip the captured rifle. He observed that it was a very good rifle if properly used.

At the entrance to Sitabhai's wing of the palace Juggut Singh dismounted and slunk into the courtyard, the livid image of fear and shame. Tarvin clattered after him, and as the eunuch was about to disappear through a door, called him back.

"You have forgotten your gun, Juggut," he said. "Don't be afraid of it." Juggut was putting up a doubtful hand to take it from him. "It won't hurt anybody this trip. Take yourself back to the lady, and tell her you are returned with thanks."

No sound came to his ear from behind the green shutters as he rode away, leaving Juggut staring after him. Nothing fell upon him from out of the arch, and the apes were tied securely. Sitabhai's next move was evidently yet to be played.

His own next move he had already considered. It was a case for bolting.

He rode to the mosque outside the city, routed out his old friend in dove-colored satin, and made him send this message:

"MRS. MUTRIE, DENVER.— *Necklace is yours. Get throat ready, and lay that track into Topaz.* TARVIN."

Then he turned his horse's head toward Kate. He buttoned his coat tightly across his chest, and patted the resting-place of the Naulahka fondly, as he strode up the path to the missionary's veranda, when he had tethered Fibby outside. His high good humor with himself and the world spoke through his eyes as he greeted Mrs. Estes at the door.

"You have been hearing something pleasant," she said. "Won't you come in?"

"Well, either the pleasantest, or next to the pleasantest, I'm not sure which," he answered, with a smile, as he followed her into the familiar sitting-room. "I'd like to tell you all about it, Mrs. Estes. I feel almightily like telling somebody. But it is n't a healthy story for this neighborhood." He glanced about him. "I'd hire the town crier and a few musical instruments, and advertise it, if I had my way; and we'd all have a little Fourth of July celebration and a bonfire, and I'd read the Declaration of Independence over the natives with a

<sup>1</sup> Copyright, 1891, by Rudyard Kipling and Wolcott Balestier. All rights reserved.

relish. But it won't do. There is a story I'd like to tell you, though," he added, with a sudden thought. "You know why I come here so much, don't you, Mrs. Estes—I mean outside of your kindness to me, and my liking you all so much, and our always having such good times together? You know, don't you?"

Mrs. Estes smiled. "I suppose I do," she said.

"Well, that's right. That's right. I thought you did. Then I hope you're my friend."

"If you mean that I wish you well, I do. But you can understand that I feel responsible for Miss Sheriff. I have sometimes thought I ought to let her mother know."

"Oh, her mother knows. She's full of it. You might say she liked it. The trouble is n't there, you know, Mrs. Estes."

"No. She's a singular girl; very strong, very sweet. I've grown to love her dearly. She has wonderful courage. But I should like it better for her if she would give it up, and all that goes with it. She would be better married," she said meditatively.

Tarvin gazed at her admiringly. "How wise you are, Mrs. Estes! How wise you are!" he murmured. "If I've told her that once I've told her a dozen times. Don't you think, also, that it would be better if she were married at once—right away, without too much loss of time?"

His companion looked at him to see if he was in earnest. Tarvin was sometimes a little perplexing to her. "I think if you are clever you will leave it to the course of events," she replied, after a moment. "I have watched her work here, hoping that she might succeed where every one else has failed. But I know in my heart that she won't. There's too much against her. She's working against thousands of years of traditions, and training, and habits of life. Sooner or later they are certain to defeat her; and then, whatever her courage, she must give in. I've thought sometimes lately that she might have trouble very soon. There's a good deal of dissatisfaction at the hospital. Lucien hears some stories that make me anxious."

"Anxious! I should say so. That's the worst of it. It is n't only that she won't come to me, Mrs. Estes,—that you can understand,—but she is running her head meanwhile into all sorts of impossible dangers. I have n't time to wait until she sees that point. I have n't time to wait until she sees any point at all but that this present moment, now and here, would be a good moment in which to marry Nicholas Tarvin. I've got to get out of Rhatore. That's the long and the short of it, Mrs. Estes. Don't ask me why. It's necessary. And I must take Kate with me. Help me if you love her."

To this appeal Mrs. Estes made the handsomest response in her power, by saying that she would go up and tell her that he wished to see her. This seemed to take some time; and Tarvin waited patiently, with a smile on his lips. He did not doubt that Kate would yield. In the glow of another success it was not possible to him to suppose that she would not come around now. Had he not the Naulahka? She went with it; she was indissolubly connected with it. Yet he was willing to impress into his service all the help he could get, and he was glad to believe that Mrs. Estes was talking to her.

It was an added prophecy of success when he found from a copy of a recent issue of the "Topaz Telegram," which he picked up while he waited, that the "Lingering Lode" had justified his expectations. The people he had left in charge had struck a true fissure vein, and were taking out \$500 a week. He crushed the paper into his pocket, restraining an inclination to dance; it was perhaps safest, on reflection, to postpone that exercise until he had seen Kate. The little congratulatory whistle that he struck up instead he had to sober a moment later into a smile as Kate opened the door and came in to him. There could be no two ways about it with her now. His smile, do what he would, almost said as much.

A single glance at her face showed him, however, that the affair struck her less simply. He forgave her; she could not know the source of his inner certitude. He even took time to like the gray house-dress, trimmed with black velvet, that she was wearing in place of the white which had become habitual to her.

"I'm glad you've dropped white for a moment," he said, as he rose to shake hands with her. "It's a sign. It represents a general abandonment and desertion of this blessed country; and that's just the mood I want to find you in. I want you to drop it, chuck it, throw it up." He held her brown little hand in the swarthy fist he pushed out from his own white sleeve, and looked down into her eyes attentively.

"What?"

"India—the whole business. I want you to come with me." He spoke gently.

She looked up, and he saw in the quivering lines about her mouth signs of the contest on this theme that she had passed through before coming down to him.

"You are going? I'm so glad." She hesitated a moment. "You know why," she added, with what he saw was an intention of kindness.

Tarvin laughed as he seated himself. "I like that. Yes; I'm going," he said. "But I'm not going alone. You're in the plan," he assured her, with a nod.

She shook her head.

"No; don't say that, Kate. You must n't. It's serious this time."

"Has n't it always been?" She sank into a chair. "It's always been serious enough for me—that I could n't do what you wish, I mean. Not doing it—that is, doing something else, the one thing I want to do—is the most serious thing in the world to me. Nothing has happened to change me, Nick. I would tell you in a moment if it had. How is it different for either of us?"

"Lots of ways. But that I've got to leave Rhatore for a sample. You don't think I'd leave you behind, I hope?"

She studied the hands she had folded in her lap for a moment. Then she looked up and faced him with her open gaze.

"Nick," she said, "let me try to explain as clearly as I can how all this seems to me. You can correct me if I'm wrong."

"Oh, you're sure to be wrong!" he cried; but he leaned forward.

"Well, let me try. You ask me to marry you?"

"I do," answered Tarvin, solemnly. "Give me a chance of saying that before a clergyman, and you'll see."

"I am grateful, Nick. It's a gift—the highest, the best; and I'm grateful. But what is it you really want? Shall you mind my asking that, Nick? You want me to round out your life; you want me to complete your other ambitions. Is n't that so? Tell me honestly, Nick; is n't that so?"

"No!" roared Tarvin.

"Ah, but it is! Marriage is that way. It is right. Marriage means that—to be absorbed into another's life: to live your own not as your own, but as another's. It is a good life. It's a woman's life. I can like it; I can believe in it. But I can't see myself in it. A woman gives the whole of herself in marriage—in all happy marriages. I have n't the whole of myself to give. It belongs to something else. And I could n't offer you a part; it is all the best men give to women, but from a woman it would do no man any good."

"You mean that you have the choice between giving up your work and giving up me, and that the last is easiest."

"I don't say that; but suppose I did, would it be so strange? Be honest, Nick. Suppose I asked you to give up the center and meaning of your life? Suppose I asked you to give up your work? And suppose I offered in exchange—marriage! No, no!" She shook her head. "Marriage is good; but what man would say that price for it?"

"My dearest girl, is n't that just the opportunity of women?"

"The opportunity of the happy women—yes; but it is n't given to every one to see marriage like that. Even for women there is more than one kind of devotion."

"Oh, look here, Kate! A man is n't an orphan-asylum or a home for the friendless. You take him too seriously. You talk as if you had to make him your leading charity, and give up everything to the business. Of course you have to pretend something of the kind at the start, but in practice you only have to eat a few dinners, attend a semiannual board-meeting, and a strawberry-festival or two to keep the thing going. It's just a general agreement to drink your coffee with a man in the morning, and be somewhere around, not too far from the fire, in not too ugly a dress, when he comes home in the evening. Come! It's an easy contract. Try me, Kate, and you'll see how simple I'll make it for you. I know about the other things. I understand well enough that you would never care for a life which did n't allow you to make a lot of people happy besides your husband. I recognize that. I begin with it. And I say that's just what I want. You have a talent for making folks happy. Well, I secure you on a special agreement to make me happy, and after you've attended to that, I want you to sail in and make the whole world bloom with your kindness. And you'll do it, too. Confound it, Kate, *we'll* do it! No one knows how good *two* people could be if they formed a syndicate and made a business of it. It has n't been tried. Try it with me! O Kate, I love you, I need you, and if you'll let me, I'll make a life for you!"

"I know, Nick, you would be kind. You would do all that a man can do. But it is n't the man who makes marriages happy or possible; it's the woman, and it must be. I should either do my part and shirk the other, and then I should be miserable; or I should shirk *you*, and be more miserable. Either way, such happiness is not for me."

Tarvin's hand found the Naulahka within his breast, and clutched it tightly. Strength seemed to go out of it into him—strength to restrain himself from losing all by a dozen savage words.

"Kate, my girl," he said quietly, "we haven't time to conjure dangers. We have to face a real one. You are not safe here. I can't leave you in this place, and I've got to go. That is why I ask you to marry me at once."

"But I fear nothing. Who would harm me?"

"Sitabhai," he answered grimly. "But what difference does it make? I tell you, you are not safe. Be sure that I know."

"And you?"

"Oh, I don't count."

"The truth, Nick!" she demanded.

"Well, I always said that there was nothing like the climate of Topaz."

"You mean you are in danger — great danger, perhaps."

"Sitabhai is n't going round hunting for ways to save my precious life, that's a fact." He smiled at her.

"Then you must go away at once; you must not lose an hour. O Nick, you won't wait!"

"That's what I say. I can do without Rhatore; but I can't do without you. You must come."

"Do you mean that if I don't you will stay?" she asked desperately.

"No; that would be a threat. I mean I'll wait for you." His eyes laughed at her.

"Nick, is this because of what I asked you to do?" she demanded suddenly.

"You did n't ask me," he defended.

"Then it is, and I am much to blame."

"What, because I spoke to the King? My dear girl, that is n't more than the introductory walk-round of this circus. Don't run away with any question of responsibility. The only thing you are responsible for at this moment is to run with me — flee, vamose, get out. Your life is n't worth an hour's purchase here. I'm convinced of that. And mine is n't worth a minute's."

"You see what a situation you put me in," she said accusingly.

"I don't put you in it; but I offer you a simple solution."

"Yourself!"

"Well, yes; I said it was simple. I don't claim it's brilliant. Almost any one could do more for you, and there are millions of better men; but there is n't one who could love you better. O Kate, Kate!" he cried, rising, "trust yourself to my love, and I'll back myself against the world to make you happy."

"No, no!" she exclaimed eagerly; "you must go away."

He shook his head. "I can't leave you. Ask that of some one else. Do you suppose a man who loves you can abandon you in this desert wilderness to take your chances? Do you suppose any man could do that? Kate, my darling, come with me. You torment me, you kill me, by forcing me to allow you a single moment out of my sight. I tell you, you are in imminent, deadly peril. You won't stay, knowing that. Surely you won't sacrifice your life for these creatures."

"Yes!" she cried, rising, with the uplifted look on her face — "yes! If it is good to live for them, it is good to die for them. I do not believe my life is necessary; but if it is necessary, that too!"

Tarvin gazed at her, baffled, disheartened, at a loss. "And you won't come?"

"I can't. Good-by, Nick. It's the end."

He took her hand. "Good afternoon," he responded. "It's end enough for to-day."

She pursued him anxiously with her eye as he turned away; suddenly she started after him. "But you will go?"

"Go! No! No!" he shouted. "I'll stay now if I have to organize a standing army, declare myself king, and hold the rest-house as the seat of government. Go!"

She put forth a detaining, despairing hand, but he was gone.

Kate returned to the little Maharaj Kunwar, who had been allowed to lighten his convalescence by bringing down from the palace a number of his toys and pets. She sat down by the side of the bed, and cried for a long time silently.

"What is it, Miss Kate?" asked the Prince, after he had watched her for some minutes, wondering. "Indeed, I am quite well now, so there is nothing to cry for. When I go back to the palace I will tell my father all that you have done for me, and he will give you a village. We Rajputs do not forget."

"It's not that, Lalji," she said, stooping over him, drying her tear-stained eyes.

"Then my father will give you *two* villages. No one must cry when I am getting well, for I am a king's son. Where is Moti? I want him to sit upon a chair."

Kate rose obediently, and began to call for the Maharaj Kunwar's latest pet — a little gray monkey, with a gold collar, who wandered at liberty through the house and garden, and at night did his best to win a place for himself by the young Prince's side. He answered the call from the boughs of a tree in the garden, where he was arguing with the wild parrots, and entered the room, crooning softly in the monkey tongue.

"Come here, little Hanuman," said the Prince, raising one hand. The monkey bounded to his side. "I have heard of a king," said the Prince, playing with his golden collar, "who spent three lacs in marrying two monkeys. Moti, wouldst thou like a wife? No, no; a gold collar is enough for thee. We will spend our three lacs in marrying Miss Kate to Tarvin Sahib, when we get well, and thou shalt dance at the wedding." He was speaking in the vernacular, but Kate understood too well the coupling of her name with Tarvin's.

"Don't, Lalji, don't!"

"Why not, Kate? Why, even I am married."

"Yes, yes. But it is different. Kate would rather you did n't, Lalji."

"Very well," answered the Maharaj, with a pout. "Now I am only a little child. When I am well I will be a king again, and no one can refuse my gifts. Listen. Those are my father's trumpets. He is coming to see me."

A bugle-call sounded in the distance. There

was a clattering of horses' feet, and a little later the Maharajah's carriage and escort thundered up to the door of the missionary's house. Kate looked anxiously to see if the noise irritated her young charge; but his eyes brightened, his nostrils quivered, and he whispered, as his hand tightened on the hilt of the sword always by his side:

"That is very good! My father has brought all his sowsars."

Before Kate could rise, Mr. Estes had ushered the Maharajah into the room, which was dwarfed by his bulk and by the bravery of his presence. He had been assisting at a review of his body-guard, and came therefore in his full uniform as commander-in-chief of the army of the state, which was no mean affair. The Maharaj Kunwar ran his eyes delightedly up and down the august figure of his father, beginning with the polished gold-spurred jack-boots, and ascending to the snow-white doeskin breeches, the tunic blazing with gold, and the diamonds of the Order of the Star of India, ending with the saffron turban and its nodding emerald aigret. The King drew off his gantlets, and shook hands cordially with Kate. After an orgy it was noticeable that his Highness became more civilized.

"And is the child well?" he asked. "They told me that it was a little fever, and I too have had some fever."

"The Prince's trouble was much worse than that, I am afraid, Maharajah Sahib," said Kate.

"Ah, little one," said the King, bending over his son very tenderly, and speaking in the vernacular, "this is the fault of eating too much."

"Nay, father, I did not eat, and I am quite well."

Kate stood at the head of the bed, stroking the boy's hair.

"How many troops paraded this morning?"

"Both squadrons, my General," answered the father, his eye lighting with pride. "Thou art all a Rajput, my son."

"And my escort—where were they?"

"With Pertab Singh's troop. They led the charge at the end of the fight."

"By the Sacred Horse!" said the Maharaj Kunwar, "they shall lead in true fight one day. Shall they not, my father? Thou on the right flank, and I on the left."

"Even so. But to do these things a prince must not be ill, and he must learn many things."

"I know," returned the Prince, reflectively. "My father, I have lain here some nights, thinking. Am I a little child?" He looked at Kate a minute, and whispered, "I would speak to my father. Let no one come in."

Kate left the room quickly, with a backward glance at the boy, and the King seated himself by the bed.

"No; I am not a little child," said the Prince. "In five years I shall be a man, and many men will obey me. But how shall I know the right or the wrong in giving an order?"

"It is necessary to learn many things," repeated the Maharajah, vaguely.

"Yes; I have thought of that lying here in the dark," said the Prince. "And it is in my mind that these things are not all learned within the walls of the palace, or from women. My father, let me go away to learn how to be a prince!"

"But whither wouldst thou go? Surely my kingdom is thy home, beloved."

"I know, I know," returned the boy. "And I will come back again, but do not let me be a laughing-stock to the other princes. At the wedding the Rawut of Bunnaul mocked me because my school-books were not so many as his. And *he* is only the son of an ennobled lord. He is without ancestry. But he has been up and down Rajputana as far as Delhi and Agra, ay, and Abu; and he is in the upper class of the Princes' School at Ajmir. Father, all the sons of the kings go there. They do not play with the women; they ride with men. And the air and the water are good at Ajmir. And I should like to go."

The face of the Maharajah grew troubled, for the boy was very dear to him.

"But an evil might befall thee, Lalji. Think again."

"I have thought," responded the Prince. "What evil can come to me under the charge of the Englishman there? The Rawut of Bunnaul told me that I should have my own rooms, my own servants, and my own stables, like the other princes—and that I should be much considered there."

"Yes," said the King, soothingly. "We be children of the sun, thou and I, my Prince."

"Then it concerns me to be as learned and as strong and as valiant as the best of my race. Father, I am sick of running about the rooms of the women, of listening to my mother and to the singing of the dance-girls; and they are always pressing their kisses on me. Let me go to Ajmir. Let me go to the Princes' School. And in a year, even in a year,—so says the Rawut of Bunnaul,—I shall be fit to lead my escort as a king should lead them. Is it a promise, my father?"

"When thou art well," answered the Maharajah, "we will speak of it again, not as a father to a child, but as a man to a man."

The Maharaj Kunwar's eyes grew bright with pleasure. "That is good," he said—"as a man to a man."

The Maharajah fondled him in his arms for a few minutes, and told him the small news of the palace—such things as would interest

a little boy. Then he said, laughing, "Have I your leave to go?"

"O my father!" The Prince buried his head in his father's beard, and threw his arms around him. The Maharajah disengaged himself gently, and as gently went out into the veranda. Before Kate returned he had disappeared in a cloud of dust and a flourish of trumpets. As he was going, a messenger came to the house, bearing a grass-woven basket piled high with shaddock, banana, and pomegranate,—emerald, gold, and copper,—which he laid at Kate's feet, saying, "It is a present from the Queen."

The little Prince within heard the voice, and cried joyfully, "Kate, my mother has sent you those. Are they big fruits? Oh, give me a pomegranate," he begged as she came back into his room. "I have tasted none since last winter."

Kate set the basket on the table, and the Prince's mood changed. He wanted pomegranate sherbet, and Kate must mix the sugar and the milk and the syrup and the plump red seeds. Kate left the room for an instant to get a glass, and it occurred to Moti, who had been foiled in an attempt to appropriate the Prince's emeralds, and had hidden under the bed, to steal forth and seize upon a ripe banana. Knowing well that the Maharaj Kunwar could not move, Moti paid no attention to his voice, but settled himself deliberately on his haunches, chose his banana, stripped off the skin with his little black fingers, grinned at the Prince, and began to eat.

"Very well, Moti," said the Maharaj Kunwar, in the vernacular; "Kate says you are not a god, but only a little gray monkey, and I think so too. When she comes back you will be beaten, Hanuman."

Moti had eaten half the banana when Kate returned, but he did not try to escape. She cuffed the marauder lightly, and he fell over on his side.

"Why, Lalji, what's the matter with Moti?" she asked, regarding the monkey curiously.

"He has been stealing, and now I suppose he is playing dead man. Hit him!"

Kate bent over the limp little body; but there was no need to chastise Moti. He was dead.

She turned pale, and lifting the basket of fruit quickly to her nostrils, sniffed delicately at it. A faint, sweet, cloying odor rose from the brilliant pile. It was overpowering. She set the basket down, putting her hand to her head. The odor dizzied her.

"Well," said the Prince, who could not see his dead pet, "I want my sherbet."

"The fruit is not quite good, I'm afraid, Lalji," she said, with an effort. As she spoke she tossed into the garden, through the open window, the uneaten fragment of the banana

that Moti had clasped so closely to his wicked little breast.

A parrot instantly swooped down from the trees on the morsel, and took it back to his perch in the branches. It was done before Kate, still unsteadied, could make a motion to stop it, and a moment later a little ball of green feathers fell from the covert of leaves, and the parrot also lay dead on the ground.

"No; the fruit is not good," she said mechanically, her eyes wide with terror, and her face blanched. Her thoughts leaped to Tarvin. Ah, the warnings and the entreaties that she had put from her! He had said that she was not safe. Was he not right? The awful subtlety of the danger in which she stood was a thing to shake a stronger woman than she. From where would it come next? Out of what covert might it not leap? The very air might be poisoned. She scarcely dared to breathe.

The audacity of the attack daunted her as much as its design. If this might be done in open day, under cover of friendship, immediately after the visit of the King, what might not the gipsy in the palace dare next? She and the Maharaj Kunwar were under the same roof; if Tarvin was right in supposing that Sitabhai could wish her harm, the fruit was evidently intended for them both. She shuddered to think how she herself might have given the fruit to the Maharaj innocently.

The Prince turned in his bed and regarded Kate. "You are not well?" he asked, with grave politeness. "Then do not trouble about the sherbet. Give me Moti to play with."

"O Lalji, Lalji!" cried Kate, tottering to the bed. She dropped beside the boy, cast her arms defensively about him, and burst into tears.

"You have cried twice," said the Prince, watching her heaving shoulders curiously. "I shall tell Tarvin Sahib."

The word smote Kate's heart, and filled her with a bitter and fruitless longing. Oh, for a moment of the sure and saving strength she had just rejected! Where was he? she asked herself reproachfully. What had happened to the man she had sent from her to take the chances of life and death in this awful land?

At that hour Tarvin was sitting in his room at the rest-house, with both doors open to the stifling wind of the desert, that he might command all approaches clearly, his revolver on the table in front of him, and the Naulahka in his pocket, yearning to be gone, and loathing this conquest that did not include Kate.

THE evening and the long night gave Kate ample time for self-examination after she had locked up the treacherous fruit, and consoled

the Maharaj, through her tears, for the mysterious death of Moti. One thing only seemed absolutely clear to her, when she rose red-eyed and unrefreshed the next morning: her work was with the women as long as life remained, and the sole refuge for her present trouble was in the portion of that work which lay nearest to her hand. Meanwhile the man who loved her remained in Gokral Seetarun, in deadly peril of his life, that he might be within call of her; and she could not call him, for to summon him was to yield, and she dared not.

She took her way to the hospital. The dread for him that had assailed her yesterday had become a horror that would not let her think.

The woman of the desert was waiting as usual at the foot of the steps, her hands clasped over her knee, and her face veiled. Behind her was Dhunpat Rai, who should have been among the wards; and she could see that the courtyard was filled with people—strangers and visitors, who, by her new regulations, were allowed to come only once a week. This was not their visiting-day, and Kate, strained and worn by all that she had passed through since the day before, felt an angry impulse in her heart go out against them, and spoke wrathfully.

"What is the meaning of this, Dhunpat Rai?" she demanded, alighting.

"There is commotion of popular bigotry within," said Dhunpat Rai. "It is nothing. I have seen it before. Only do not go in."

She put him aside without a word, and was about to enter when she met one of her patients, a man in the last stage of typhoid fever, being borne out by half a dozen clamoring friends, who shouted at her menacingly. The woman of the desert was at her side in an instant, raising her hand, in the brown hollow of which lay a long, broad-bladed knife.

"Be still, dogs!" she shouted in their own tongue. "Dare not to lay hands on this *peri*, who has done all for you!"

"She is killing our people!" shouted a villager.

"Maybe," said the woman, with a flashing smile; "but I know who will be lying here dead if you do not suffer her to pass. Are you Rajputs; or Bhils from the hills, hunters of fish and diggers after grubs, that you run like cattle because a lying priest from nowhere troubles your heads of mud? Is she killing your people? How long can you keep that man alive with your charms and your *muntras*!" she demanded, pointing to the stricken form on the stretcher. "Out—go out! Is this hospital your own village to defile? Have you paid one penny for the roof above you or the drugs in your bellies? Get hence before I spit upon you!" She brushed them aside with a regal gesture.

"It is best not to go in," said Dhunpat Rai

in Kate's ear. "There is local holy man in the courtyard, and he is agitating their minds. Also, I myself feel much indisposed."

"But what does all this mean?" demanded Kate again.

For the hospital was in the hands of a hurrying crowd, who were strapping up bedding and cooking-pots, lamps and linen, calling to one another up and down the staircases in subdued voices, and bringing the sick from the upper wards as ants bring eggs out of a broken hill, six or eight to each man—some holding bunches of marigold flowers in their hands, and pausing to mutter prayers at each step, others peering fearfully into the dispensary, and yet others drawing water from the well and pouring it out around the beds.

In the center of the courtyard, as naked as the lunatic who had once lived there, sat an ash-smeared, long-haired, eagle-taloned, half-mad, wandering native priest, and waved above his head his buckhorn staff, sharp as a lance at one end, while he chanted in a loud, monotonous voice some song that drove the men and women to work more quickly.

As Kate faced him, white with wrath, her eyes blazing, the song turned to a yelp of fierce hatred.

She dashed among the women swiftly—her own women, whom she thought had grown to love her. But their relatives were about them, and Kate was thrust back by a bare-shouldered, loud-voiced dweller of the out-villages in the heart of the desert.

The man had no intention of doing her harm, but the woman of the desert slashed him across the face with her knife, and he withdrew howling.

"Let me speak to them," said Kate, and the woman beside her quelled the clamor of the crowd with uplifted hands. Only the priest continued his song. Kate strode toward him, her little figure erect and quivering, crying in the vernacular, "Be silent, thou, or I will find means to close thy mouth!"

The man was hushed, and Kate, returning to her women, stood among them, and began to speak impassionedly.

"O my women, what have I done?" she cried, still in the vernacular. "If there is any fault here, who should right it but your friend? Surely you can speak to me day or night." She threw out her arms. "*Sunlo, hamaree bhain-log!* Listen, my sisters! Have you gone mad, that you wish to go abroad now, half cured, sick, or dying? You are free to go at any hour. Only, for your own sake, and for the sake of your children, do not go before I have cured you, if God so please. It is summer in the desert now, and many of you have come from many coss distant."

"She speaks truth, she speaks truth," said a voice in the crowd.

"Ay, I do speak truth. And I have dealt fairly by ye. Surely it is upon your heads to tell me the cause of this flight, and not to run away like mice. My sisters, ye are weak and ill, and your friends do not know what is best for ye. But I know."

"*Arre!* But what can we do?" cried a feeble voice. "It is no fault of ours. I, at least, would fain die in peace, but the priest says—"

"Then the clamor broke out afresh. "There are charms written upon the plasters —"

"Why should we become Christians against our will? The wise woman that was sent away asks it."

"What are the meanings of the red marks on the plasters?"

"Why should we have strange devil-marks stamped upon our bodies? And they burn, too, like the fires of hell."

"The priest came yesterday,—that holy man yonder,—and he said it had been revealed to him, sitting among the hills, that this devil's plan was on foot to make us lose our religion —"

"And to send us out of the hospital with marks upon our bodies — ay, and all the babies we should bear in the hospital should have tails like camels, and ears like mules. The wise woman says so; the priest says so."

"Hush! hush!" cried Kate, in the face of these various words. "What plasters? What child's talk is this of plasters and devils? Not one child but many have been born here, and all were comely. Ye know it! This is the word of the worthless woman whom I sent away because she was torturing you."

"Nay; but the priest said —"

"What care I for the priest? Has he nursed you? Has he watched by you of nights? Has he sat by your bedside, and smoothed your pillow, and held your hand in pain? Has he taken your children from you and put them to sleep, when he needed an hour's rest?"

"He is a holy man. He has worked miracles. We dare not face the anger of the gods."

One woman, bolder than the rest, shouted, "Look at this!" and held before Kate's face one of the prepared mustard-leaves lately ordered from Calcutta, which bore upon the back, in red ink, the maker's name and trade-mark.

"What is this devil's thing?" demanded the woman, fiercely.

The woman of the desert caught her by the shoulder and forced her to her knees.

"Be still, woman without a nose!" she cried, her voice vibrating with passion. "She is not of thy clay, and thy touch would defile her. Remember thine own dunghill, and speak softly."

Kate picked up the plaster, smiling.

"And who says there is devil's work in this?" she demanded.

"The holy man, the priest. Surely he should know."

"Nay, ye should know," said Kate, patiently. She understood now, and could pity. "Ye have worn it. Did it work thee any harm, Pithira?" She pointed directly toward her. "Thou hast thanked me not once but many times for giving thee relief through this charm. If it was the devil's work, why did it not consume thee?"

"Indeed, it burnt very much indeed," responded the woman, with a nervous laugh.

Kate could not help laughing. "That is true. I cannot make my drugs pleasant. But ye know that they do good. What do these people, your friends — villagers, camel-drivers, goatherds — know of English drugs? Are they so wise among their hills, or is the priest so wise, that they can judge for ye here, fifty miles away from them? Do not listen! Oh, do not listen! Tell them that ye will stay with me, and I will make ye well. I can do no more. It was for that I came. I heard of your misery ten thousand miles away, and it burnt into my heart. Would I have come so far to work you harm? Go back to your beds, my sisters, and bid these foolish people depart."

There was a murmur among the women, as if of assent and doubt. For a moment the decision swayed one way and the other.

Then the man whose face had been slashed shouted, "What is the use of talking? Let us take our wives and sisters away. We do not wish to have sons like devils. Give us your voice, O father!" he cried to the priest.

The holy man drew himself up, and swept away Kate's appeal with a torrent of abuse, imprecation, and threats of damnation; and the crowd began to slip past Kate by twos and threes, half carrying and half forcing their kinsfolk with them.

Kate called on the women by name, beseeching them to stay, reasoning, arguing, expostulating. But to no purpose. Many of them were in tears; but the answer from all was the same. They were sorry, but they were only poor women, and they feared the wrath of their husbands.

Minute after minute the wards were depopulated of their occupants, as the priest resumed his song, and began to dance frenziedly in the courtyard. The stream of colors broke out down the steps into the street, and Kate saw the last of her carefully swathed women borne out into the pitiless sun-glare — only the woman of the desert remaining by her side.

Kate looked on with stony eyes. Her hospital was empty.

# THE NATURE AND ELEMENTS OF POETRY.

## III. CREATION AND SELF-EXPRESSION.

THE difficulty that confronts one who enters upon a general discussion of poetry is its universal range. The portals of his observatory tower before him, flashing yet frowning, and inscribed with great names of all the ages. Mount its stairway, and a chart of the field disclosed is indeed like that of the firmament. In what direction shall we first turn? To the infinite dome at large, or toward some particular star or group? We think of inspiration, and a Hebrew seer glows in the prophetic East; of gnomic wisdom and thought, and many fixed white stars shine tranquilly along the equinox, from Lucretius to Emerson; of tragedy and comedy, the dramatic coil and mystery of life, and group after group invite the lens—for us, most of all, that English constellation blazing since “the spacious times of great Elizabeth”; of beauty, and the long train of poetic artists, with Keats like his own new planet among them, swims into our ken. Asia is somewhere beyond the horizon, and in view are countless minor lights—the folk-singers and minstrels of many lands and generations.

The future lecturer will have the satisfaction of giving his attention to a single master or school—to the Greek dramatists, to Dante, or Milton, or Goethe; more than one will expend his resources upon the mimic world of Shakspeare, yet leave as much for his successors to accomplish as there was before. Their privilege I do not assume; since these initiatory discourses have to do with the elements of which poetry is all compact, and with the spirit in fealty to which its orbs shine, and have their being, and rehearse the burthen of their radiant progress:

Beneath this starry arch  
Nought resteth or is still:  
But all things hold their march,  
As if by one great will:  
Moves one, move all: hark to the footfall!  
On, on, forever!

Still, I wish in some way to review this progress of poesy. Essayng then, for the little that can be done, to look first at the broad

characteristics of the field, we see that there are, at all events, two streams into which its vast galaxy is divided—though they intersect each other again and again, and in modern times seem almost blended. These do not relate to the technical classification of poetry: to its partition by the ancients into the epic, dramatic, lyric, and the idyllic—unto which we have added the reflective, and have merged them all in the composite structures of modern art. Time has shown that we cannot overrate the method of those intuitive pagans. No one cares for Wordsworth's division of his own verse into poems of imagination, of fancy, and the like, the truth being that they all, with the exception of a few spontaneous lyrics, are poems of reflection, often glorified by the imagination, sometimes lightened by fancy, but of whose predominant spirit their author was apparently the least successful judge. The Greeks felt that the spirit shapes the form of art, and therefore is revealed by it. Assume, then, the fitness of poetic orders, styles, and measures; that these are known to you and me, and thus we may leave dactyls and choriambes to the metrical anatomists, and rhymes to the Walkers and Barnums. Passing to the more essential divisions of expression, you will find their types are defined by the amount of personality which they respectively hold in solution; that poetry is differentiated by the Me and the Not Me—by the poet's self-consciousness, or by the representation of life and thought apart from his own individuality.

That which is impersonal, and so very great at its best, appears the more creative as being a statement of things discerned by free and absolute vision. The other order is so affected by relations with the maker's traits and tastes that it betokens a relative and conditioned imagination; and is thus by far the larger division, since in most periods it is inevitable that the chief impulse to song should be a conscious or unconscious longing for personal expression.

THE gift of unconditional vision has been vouchsafed both to the primitive world, and to races at their height of action and invention. The objective masterpieces of poetry consist, first, of those whose origin is obscure, and which are so naturally inwrought with history and

popular traits that they seem growths rather than works of art. Such are the Indian epics, the Northern sagas, the early ballads of all nations, and of course the Homeric poems of Greece. These are the lusty product of the youth of mankind, the song and story that come when life is unjaded, faith unsophisticated, and human nature still in voice with universal Pan. The less spontaneous but equally vital types are the fruit of later and constructive periods — “golden” ages, whose masterpieces are composed with artistic design and still unwearyed genius. Whether epic or dramatic, and whether traditional or the product of schools and nations in their prime, the significance of objective poetry lies in its presentment of the world outside, and not of the microcosm within the poet’s self. His ideal mood is that of the Chinese sage, from whose wisdom, now twenty-six centuries old, the artist La Farge, himself imbued with the spirit of the “most eastern East,” has cited for me these phrases: “I am become as a quiet water, or a mirror reflecting what may be. It keeps nothing, it refuses nothing. What it reflects is there, but I do not keep it: it is not I.” And again: “One should be as a vacuum, so to be filled by the universe. Then the universe will fill me, and pour out again.” Which dark saying I interpret here as an emblem of the receptivity of the artist to life at large. This it is his function to give out again, illumined, but unadulterate. The story is told, the song chanted, the drama constructed, with the simplest of understandings between audience and maker: as between children at their play, artisans at their handicraft, recounter and hearers around the desert fire. Every literature has more or less of this free, absolute poetry. But only in the drama, and at distinctively imaginative periods, have poets of the Christian era been quite objective; not even there and then, without in most cases having “unlocked” their hearts by expression of personal feeling. This process — exemplified in the sonnets of Shakespeare, and in the minor works of Dante, Tasso, Cervantes, Calderon, Camoëns — rarely suggested itself to the antique poets, whose verses were composed for the immediate verdict of audiences great or small, and in the Attic period distinctly as works of art: necessarily universal, and not introspective. Nor would much self-intrusion then have been tolerated. Imagine the Homeric laughter of an Athenian conclave, every man of them with something of Aristophanes in him, at being summoned to listen to the sonnetary sorrows of a blighted lover! There were few Werthers in those days. Bad poets, and bores of all sorts, were not likely to flourish in a society where ostracism, the custody of the Eleven, and the draught of hem-

lock were looked upon as rather mild and exemplary modes of criticism.

Now, in distinction from unsophisticated and creative song, comes the voice of the poet absorbed in his own emotions and dependent on self-analysis for his knowledge of life. Here is your typical modern minor poet. But here also are some of the truest “bards of passion and of pain” that the world has known. Again, there are those who are free from the Parnassian egotism, but whose manner is so pronounced that every word they utter bears its author’s stamp: their tone and style are unmistakable. Finally, many are confined implacably to certain limits. One cares for beauty alone, an artist pure and simple; another is a balladist; a third is gifted with philosophic insight of nature; still another has a genius for the psychological analysis of life. Each of these appears to less advantage outside his natural range. The vision of all these classes is conditioned.

An obvious limitation of the speechless arts is that they can be termed subjective only with respect to motive and style. We have the natural landscapist, and the figure-painter, while nearly all good painters, sculptors, architects, musicians, are recognizable, as you know, by their respective styles, but otherwise all arts, save those of language, are relatively impersonal and objective.

The highest faculties of vision and execution are required to design an absolutely objective poem, and to insure its greatness. There is no middle ground; it is great, or else a dull and perfunctory mechanism. The force of the heroic epics, whose authorship is in the crypt of the past, seems to be not that of a single soul but of a people; not that of a generation, but of a round of eras. Yet the final determination of poetic utterance is toward self-expression. The minstrel’s soul uses for its medium that slave of imaginative feeling, language. It is a voice — a voice — and the emotion of its possessor will not be denied. The poet is the Mariner, whose heart burns within him until his tale is told:

I pass, like night, from land to land;  
I have strange power of speech;  
That moment that his face I see,  
I know the man that must hear me:  
To him my tale I teach.

RACES themselves have a bent toward one of the two generic types, so that with one nation or people the creative poet is the exception, and with another the rule. The Asiatic inspiration, even in its narrative reliquæ, is more subjectively vague than that which we call the antique — that of the Hellenes. But the extreme Eastern field requires special study, and is beyond the limits of this course, so that I

will only confess my belief that much of our fashionable adaptation of Hindu, Chinese, Japanese literature represents more honestly the ethics and poetic spirit of its western students than the Oriental feeling and conceptions; that it is a latter-day illumination of Brahmanic esoterics rather than the absolute Light of Asia, — whether better or worse, not a veritable transfer, but the ideal of Christendom grafted on the Buddhist stock. It is doubtful, in fact, whether the Buddhists themselves fully comprehend their own antiquities; and if our learned virtuosos, from Voltaire and Sir William Jones to Sir Edwin Arnold, fail to do so, they nevertheless have found the material for a good deal of interesting verse. It will be a real exploit when some one does for the Buddhist epos and legendary what John Payne and Captain Burton have done for the Arabic "Thousand Nights and One Night." Then we shall at least know those literatures as they are; nor will it be strange if they prove to be, in some wise, as much superior to our conception of them as Payne's rendering of the "Arabian Nights" is to that of Galland, or as Butcher and Lang's prose translation of Homer is to Lord Derby's verse. Of such a paraphrase as Fitzgerald's "Rubáiyát of Omar Khayyám," one at once declares, in Landor's phrase, that it is more original than the originals: the western genius in this instance has produced an abiding poem, unique in its interfusion of the Persian and the neo-English dispositions.

But with Hebrew poetry, that of the Bible, we have more to do, since we derive very closely from it. There is no literature at once so grand and so familiar to us. Its inherent, racial genius was emotional and therefore lyrical (though I am not with those who deem all lyrical poetry subjective), and a genius of so fiery and prophetic a cast that its personal outbursts have a loftiness beyond those of any other literature. The Hebrew was, and the orthodox Israelite remains, a magnificent egoist. Himself, his past, and his future, are a passion. But — and this is what redeems his egoism — they are not his deepest passion; he has an intenser emotion concerning his own race, the chosen people, a more fervent devotion to Jehovah — his own Jehovah, if not the God of a universe. Waiving the question whether the ancient Jew was a monotheist, we know that he trusted in the might of his own God as overwhelmingly superior to that of all rivals. His God, moreover, was a very human one. But the Judaic anthropomorphism was of the most transcendent type that ever hath entered into the heart of man.

I do not, then, class the Hebrew poetry, which, though lyrical, gives vent not so much to the self-consciousness of the psalmist or

prophet or chieftain as to the pride and rapture of his people, with that which is personal and relative, any more than I would count the winged Pindar in his splendid national odes, or even his patriotic Grecian followers, as strictly subjective, however lyrical and impassioned. Such bards are trumpet-tongued with the exaltation of their time and country: they speak not of themselves, but for their people. To the burning imagination of Moses and the prophets, and to the rhythmical eloquence of the Grecian celebrants, I may refer when noting the quality of inspiration. I think the national and religious utterance of the Hebrews even more characteristic than their personal outgivings; they were carried out of and above themselves when moved to song. But there is no more wonderful poetry of the emotional order than the psalms of David and his compeers relating to their own trials and agonies, their loves and hates and adoration. As we agonize and triumph with a supreme lyrical nature, its egoism becomes holy and sublime. The stress of human feeling is intense in such poetry as that of the sixth Psalm, where the lyrist is weary with groaning, and waters the couch with his tears, exclaiming, "But thou, O Lord, how long?" and that of the thirteenth, when he laments: "How long wilt thou forget me, O Lord? Forever?" and in successive personal psalms wherein the singer, whether David or another, avows his trust in the Deity, praying above all to overcome his enemies and to have his greatness increased. These petitions, of course, do not reach the lyrical splendor of the psalms of praise and worship: "The heavens declare the glory of God," "The earth is the Lord's and the fullness thereof;" and those of Moses — "He that dwelleth in the secret place of the Most High," and its immediate successors. But the Hebrew, in those strains where he communes with God alone, other protectors having failed him, is at the climax of emotional song.

Modern self-expression is not so direct and simple. We doubt the passion of one who wears his heart upon his sleeve. The naïveté of the Davidic lyre is beyond question, and so is the superb unrestraint of the Hebrew prophecy and pæans. We feel the stress of human nature in its articulate moods. This gives to the poetry of the Scriptures an attribute possessed only by the most creative and impersonal literature of other tongues — that of universality. Again, it was all designed for music, by the poets of a musical race, and the psalms were arranged by the first composers — the leaders of the royal choir. It retains forever the fresh tone of an epoch when lyrical composition was the normal form of expression. Then its rhythm is free, unrestrained, in extreme opposition to

that of classical and modern verse, relying merely upon antiphony, alliteration, and parallelism. Technical abandon, allied with directness of conception and faithful revelation of human life, makes for universality—makes of the Hebrew Scriptures a Bible, a world's book that can be translated into all tongues with surpassing effect, notably into a language almost as direct and elemental as its own, that of our Anglo-Saxon in its Jacobean strength and clarity.

Advancing further, you perceive that where a work survives as an exception to the inherent temper of a people, it is likely to exhibit greatness. The sublimest poem of antiquity is impersonal, yet written in the Hebrew tongue. The book of Job, the life-drama of the Man of Uz, towers with no peak near it; its authorship lost, but its fable associated in mind with the post-Noachian age, the time when God discoursed with men and the stars hung low in the empyrean. It is both epic and dramatic, yet embodies the whole wisdom of the patriarchal race. Who composed it? Who carved the Sphinx, or set the angles of the Pyramids? The shadow of his name was taken, lest he should fall by pride, like Eblis. The narrative prelude to Job has the direct epic simplicity—a Cyclopean porch to the temple, but within are Heaven, the Angels, the plumed Lord of Evil, before the throne of a judicial God. The personages of the dialogue beyond are firmly distinguished: Eliphaz, Bildad, Zophar, Elihu,—to whom the inspiration of the Almighty gave understanding,—and the smitten protagonist himself, majestic in ashes and desolation. Each outvies the other in grandeur of language, imagination, worship. Can there be a height above these lofty utterances? Yes; only in this poem has God answered out of the whirlwind, his voice made audible, as if an added range of hearing for a space enabled us to comprehend the reverberations of a superhuman tone. I speak not now of the motive, the inspiration, of the symphonic masterpiece; it is still a mortal creation, though maintaining an impersonality so absolute as to confirm our sense of mystery and awe.

It has been said of the Hebrew language that its every word is a poem; and there are books of the Old Testament, neither lyrical nor prophetic, so exquisite in kind that I call them models of impersonal art. Considered thus, the purely narrative idyls of Esther and Ruth have so much significance that I shall have occasion to recur to them with reference to poetic beauty and construction.

TURNING from Semitic literature to the Aryan in its Hellenic development, we at once enter a naturally artistic atmosphere. Until after his

Attic prime, the Greek, with no trick of introspection, concerned himself very little about his individual pathology, being far too much absorbed with an inborn sense of beauty, and with his office of imaginative creation. His great lyrical poets—Alcæus, Simonides, Pindar—rehearsed, as I have said, the spirit of a people rather than of themselves. As with the Hebrews, but conversely, the few exceptions to this usage were very notable, else they could not have arisen at all. One extremity of passion for which, in their sunlit life, they found expression compulsive, was that of love; and among those who sang its delights, or lamented its incompleteness, we have the world's accepted type in Love's priestess of Mitylene, the "violet-crowned, pure, sweetly smiling Sappho." The pity of it is that we have only the glory of her name, celebrated by her contemporaries and successors, and justified to us by two lyrics in the stanzaic measure of her invention, and by a few fragments of verse more lasting than the tablets of the Parthenon. But the "Hymn to Aphrodite" and the *Φαίνεταί μοι κῆρος* are enough to assure us that no other singer has so united the intensity of passion with charm of melody and form. A panting, living woman, a radiant artist, are immanent in every verse. After twenty-five centuries, Sappho leads the choir of poets that have sung their love; and from her time to that of Elizabeth Browning no woman has so distinguished her sex. The Christian sibyl moved in a more ethereal zone of feeling, but could not equal her Ægean prototype in unerring art, although, by the law of true expression, most artistic where she is most intense.

The note which we call modern is frequent in the dramas of Euripides, and in those of his satirist, Aristophanes; it drifts, in minor waves of feeling, with the lovely Grecian epitaphs and tributes to the dead—that feeling, the breath of personal art, which Mahaffy illustrates from the bas-reliefs and mortuary emblems which beautify the tombs west of Athens. The Greek anthology is rich with sentiment of this cast, so pathetic—and so human. As an instance of what I mean, let me repeat Cory's imitation of the elegiacs of Callimachus on his friend Heracleitus:

They told me, Heracleitus, they told me you were dead,—

They brought me bitter news to hear and bitter tears to shed.

I wept, as I remembered how often you and I  
Had tired the sun with talking and sent him down  
the sky.

And now that thou art lying, my dear old Carian  
gust,  
A handful of gray ashes, long, long ago at rest,

Still are thy pleasant voices, thy nightingales,  
awake,  
For Death, he taketh all away, but them he cannot take.

This, to be sure, is a paraphrase, yet it conveys the feeling better than the more compact version by the poet-scholar Andrew Lang. Nothing can exceed, in its expression of the spirit, Mr. Lang's handling of Meleager's verses to the memory of his loved and lost Heliodora:

Tears for my lady dead,  
Heliodore!  
Salt tears, and strange to shed,  
Over and o'er.

But I quote no more of this melody, since you can find it, in a certain romance of "Cleopatra," shining by contrast with much of that story like the "jewel in an Ethiop's ear." Others of Mr. Lang's elusive, exquisite renderings, done as it seems by the first touch, are incomparable with any lyrical exploits of their kind since "Music's wing" was folded in the dust of Shelley.

Follow the twilight path of elegiac verse to the Alexandrian epoch, and you find the clear Athenian strain succeeded by a compound of artifice and nature, so full of sentiment withal as to seem the forerunner of Christian art—in some respects the prototype of our own idyllic poetry. The studiously impassioned lament of Moschus for Bion is nearer than the poetry of his dead master, and of that master's master, Theocritus (always excepting the latter's "Thalysia"), to our own modes of feeling and treatment. It set the key for our great English elegies, from Spenser's "Astrophel" and Milton's "Lycidas" to Shelley's "Adonais" and Arnold's lament for Clough. The subjectivity of the Greek idyllists is thus demonstrated. They were influenced largely by the Oriental feeling, alike by its sensuousness and its solemnity, and at times they borrowed from its poets—as in the transfer by Moschus of a passage from Job into his Dorian hexameters, of which I will read my own version:

Even the mallows—alas! alas! when once in  
the garden  
They, or the pale-green parsley and crisp-growing  
anise, have perished,  
Afterward they will live and flourish again at their  
season;  
We, the great and brave, and the wise, when  
death has benumbed us,  
Deaf in the hollow ground a silent, infinite slumber  
Sleep: forever we lie in the trance that knoweth  
no waking.

We pass with something like indifference to the Latin poets, because their talent, in spite of many noble legacies bequeathed us, so lacked the freedom, the originality, the inimitable po-

etic subtleties which animated everything that was Grecian. Hellas was creative of beauty and inspiration; Italia, too, was a creative soil, but of government, empire, law. Her poetry, as it was less an impulse and more a purpose, belongs largely to the mixed class. In its most objective portions there is an air of authorship and self-expression. I will not speak now of Lucretius, who sends out the one dauntless ray of contemplative splendor between the Hebraic sages and the seers of our new dispensation. But Vergil is a typical example of the poet whose *style* is so unmistakable that every verse overflows with personal quality—a style that endures, establishes a pupilage. Vergil borrowed fire from Greece to light the altars of beauty in a ruder land. The Iliad and Odyssey kindled the invention and supplied the construction of his Æneids; the Georgics, his sturdiest cantos, took their motive from Hesiod; the Eclogues are a paraphrase upon Theocritus. But the Mantuan's style is preëminently his own—the limpid, liquid, sweet, steadfast Vergilian intonation on which monarchs and statesmen hung enchanted, and which was confessedly the parent-voice of many an after bard. Tennyson, in point of a style whose quality is the more distinct for its diffusiveness,—whose potency, to borrow the homeopathic term, is the greater for its perfect trituration,—has been the English Vergil of our day. Browning's trade-mark is, plainly, the antithesis of what I here mean by style. Our own Longfellow furnishes the New World counterpart of Vergil. In the ascetic and prosaic America of his early days he excited a feeling for the beautiful, borrowing over sea and from all lands the romance-forms that charmed his countrymen and guided them to taste and invention. His originality lay in the specific tone that made whatever Longfellow's sweet verse rehearsed a new song, and in this wise his own. Mentioning these leaders of to-day only to strengthen my reference to Vergil,—and as illustrating Schlegel's point that "what we borrow from others, to assume a true poetical shape, must be born again within us,"—I may add that there is a good deal of personal feeling and expression in the Latin epigrammatists and lyrists. We have Ovid with his *Tristia* of exile, and Catullus with his Sapphic grace and glow, and a Latin anthology of which the tenderest numbers are eloquent of grief for lover and friend gone down to the nebulous pagan under-world. The deaths that touched them most were those of the young and dear, cut off with their lives un-lived, their promise of grace and glory brought to naught. Both the Greeks and the Latins, in their joy of life, strongly felt the pathos of this earthly fruition. That famous touch of Vergil's, in the sixth Æneid, was not all artifice: the passage in which

Æneas sees a throng of shades awaiting their draught of Lethe and reincarnation in the upper world — and among them the beauteous youthful spirit that in time will become Marcellus, son of the Emperor's sister Octavia, and heir to the throne of the Cæsars.

Heu, miserande puer! si qua fata aspera rumpas,  
Tu Marcellus eris. Manibus date lilia plenis,  
Purpureos spargam flores.<sup>1</sup>

Every school-boy, from the poet's day to the present, knows how this touch of nature made Vergil and his imperial listeners kin. Its consecrating beauty, in a new world and after nineteen centuries, supplies the legend — *Manibus date lilia plenis* — of our American hymn for Decoration Day. Out of the death of a youth as noble and gracious,<sup>2</sup> in whom centered limitless hopes of future strength and joy, the spirit of poetry well may spring and declare — as from yonder tablet in this very place — that his little life was not fruitless, and that its harvest shall be perennial.

A passing reference may be made at this point to a class of verse elegantly produced in various times of culture and refinement: the hearty overflow of the taste, philosophy, good-fellowship, especially of the temperament, of its immediate maker. Thus old Anacreon started off, that Parisian of Teos. When you come to the Latin Horace, who like Vergil took his models from the Greek, you have, above all, the man himself before you: the progenitor of an endless succession, in English verse, of our Swifts and Priors and Cannings and Dobsons, of our own inimitable Holmes. There are feeling and fancy, and everything wise and witty and charming, in the individuality of these Horatii; they give us delightful verse, and human character in sunny and wholesome moods. One secret of their attractiveness is their apt measurement of limitations; they have made no claim to rank with the great imaginative poets who supply our loftier models and illustrations.

RETURN for a moment to that creative art which is found in early narrative poetry and the true drama. The former escapes the pale cast of thought through the conditions of its formation and rehearsal. Primitive ballads have a straightforward felicity; many of them a conjuring melody, as befits verse and music born together. Their gold is virgin, from the rock strata, and none the better for refining and burnishing. No language is richer in them than

<sup>1</sup> "Ah, dear lamented boy! if thou canst break fate's harsh decrees, thou wilt be our own Marcellus. Bring lilies in handfuls; let me strew the purple flowers!"

<sup>2</sup> Percy Græme Turnbull: born May 28, 1878; died February 12, 1887.

the English. Our traditional ballads, such as "Clerk Saunders," "Burd Ellen," "Sir Patrick Spens," "Chevy-Chace," "Edward! Edward!" usually are better poetry than those of known authorship. Not until you come to Drayton's "Agincourt" do you find much to rival them. What I say applies to the primitive ballads of all nations. Touch them with our ratiocination, and their charm vanishes. The epos evolved from such folk-songs has the same directness. The rhythm of its imagery and narrative, swift and strong and ceaseless as a great river, would be sadly ruffled by the four winds of a minstrel's self-expression — its current all set back by his emotional tides,

The hate of hate, the scorn of scorn,  
The love of love.

The modern temper is not quick to apprehend a work of simple beauty and invention. It presupposes, judging from itself, underlying motives even for the legends and matutinal carols of a young people. Age forgets, and fails to understand, the heart of childhood: we "ancients of the earth" misconceive its youth. We even class together the literatures of races utterly opposed in genius and disposition. Some would put the Homeric epos on the same footing with the philosophical drama of Job, the end of which is avowedly "to justify the ways of God to men." Professor Snider, who has exploited well the ethical scheme of "Faust," would similarly deal with the Iliad and the Odyssey. Homer, he thinks, had in mind a grand exposition of Providence, divine rule, the nature of good and evil, and so forth, in relation to which the narrative and poetry of those epics are subordinate and allegorical. But why should we reason too curiously? Both instinct and common sense are against it. Whether the Homeric epos was a growth, or an originally synthetic creation, I believe that the legends of the glorious Ionian verse were recited for the delight of telling and hearing; that the unresting, untiring, billowy hexameters were intoned with the unction of the bard; that they do convey the ancestral reverence, the religion, the ethics, of those adventurous dædal Greeks, but simply as a consequence of their spontaneous truth and vitality. Their poets sang with no more casuistic purpose than did the nightingales in the grove of Colonus. Hence their directness, and their unconscious transmission of the Hellenic system of government and worship. If you wish instruction, everything is essentially natural and true. A perfect transcript of life — the best of teachers — is before us. In the narrative books of the Bible the good and bad appear without disguise. All is set forth with the frankness that made the heart of the Hebrew

tent-dweller the heart of the world thereafter. In Homer, the deities are *dramatis personæ*, very human, with sovereign yet terrestrial passions; they dwell like feudal lords, slightly above their dependents, alternating between contempt for them and interest in their affairs. But where is the healthy man or boy who reads these epics without an absorption in their poetry and narrative that is the clue to their highest value? I have little patience with the critics who would disillusionize us. What is the use of poetry? Why not, in this workaday world, yield ourselves to its enjoyment? Homer makes us forget ourselves because he is so self-forgetful. He accepts unquestioningly things as they are. The world has now grown hoary with speculation, but at times, in art as in religious faith, except ye be as children ye cannot enter into the kingdom. We go back to the Iliad and the Odyssey, to the creative romance and poesy of all literatures, as strong men wearied seek again the woods and waters of their youth, for a time renewing the dream which, in sooth, is harder to summon than to dispel. Such a renewal is worth more than any moral, when following the charmed wanderings of the son of Laertes, by isle and mainland, over the sea whose waters still are blue and many-voiced, but whose mystic nymphs and demigods have fled forever; it is worth more than a philosophy,

When the oars of Ithaca dip so  
Silently into the sea  
That they wake not sad Calypso,  
And the hero wanders free.  
He breaths the ocean furrows  
At war with the words of fate,  
And the blue tide's low susurrus  
Comes up to the Ivory Gate.

THE dramas of the Attic prime, although equally objective with these epics, are superb poetry, with motives not only creative but distinctly religious and ethical. They recognize and illustrate the eternal law which brings a vengeance upon somebody for every wrong, the inscrutable Nemesis to which even the Olympian gods are subject. In this respect the "Prometheus Bound," deathless as the Titan himself, is the first and highest type of them all. The chorus, the major and minor personages, the prophetic demigod, and even the deathless Zeus, take for granted the power of a righteous Destiny. The wrong-doer, whether guilty by chance or by will, as in the case of the "Edipus Tyrannus" of Sophocles, even pronounces and justifies his own doom. I will not now consider the grandeur of these wonderful productions. Through the supreme endurance of poetry they have come down to us, while the pictures of Zeuxis and Apelles, and the "Zeus"

and "Athene" of Pheidias, are but traditions of "the glory that was Greece." The point I make is that these are absolute dramas. They are richly freighted, like Shakspeare's, with oracles and expositions; but their inspired wisdom never diverts us from the high inexorable progress of the action. It is but a relief and an adjuvant. You may learn the bent of the dramatist's genius from his work, but little of his own emotions and experiences. Nor is the wisdom so much his wisdom, as it is something residual from the history and evolution of his people. The high gods of Æschylus and Sophocles for the most part sit above the thunder: but the human element pervades these dramas; the legendary demigods, heroes, gentes, that serve as the personages—Hermes, Herakles, the houses of Theseus, Atreus, Jason—all are types of humankind, repeating the Hebraic argument of transmitted tendency, virtue, and crime, and the results of crime especially, from generation to generation. The public delight in the Athenian stage was due to its strenuous dramatic action at an epoch when the nation was in extreme activity. Its religious cast was the quintessence of morals derived from history, from the ethical of the gnomic and didactic bards, from the psychological conditions following great wars and crises such as those which terminated at Salamis and Plataea. Æschylus and Sophocles were inspired by their times. They soared in contemplation of the life of gods and men: no meaner flight contented them. The apparent subjectivity of Euripides is due to his relative modernness. No literature was ever so swift to run its course as the Attic drama, from the Cyclopean architecture of the "Prometheus" to the composite order of "Alcestis" and "Ion." Euripides, freed somewhat from the tyranny of the colossal myths, was almost Shaksperian in his reduction of them to every-day life with its vicissitudes and social results. His characters are often unheroic, modern, very real and emotional men and women. Aristophanes, still more various, and at times equal to the greatest of the dramatists, as a satirist necessarily enables us to judge of his own taste and temper; but in his travesties of the immediate life of Athens he is no more self-intrusive than Molière, twenty centuries later, in his portraits of *Tartuffe* and *Harpagon* and "Les Précieuses." Men create poetry, yet sometimes poetry creates a man for us—witness our ideal of the world's Homer. The hearts of the Grecian dramatists were so much in their business (to use the French expression) that they have told us nothing of themselves; but this implies no insignificance. So reverse to commonplace, so individual were they each and all, that in point of fact we know from various sources more of their respective characters, ambitions, stations, than we know

of that chief of dramatists who was buried at Stratford less than three centuries ago.

But I well may hesitate to discourse upon the Greek and Latin poets to the pupils of an admired expounder of the classical literatures;<sup>1</sup> and I use the word "literatures" advisedly, since, with all his philological learning, it is perhaps his greatest distinction to have led our return to sympathetic comprehension of the style and spirit of the antique masters—to have applied, I may say, his genius not only to the materials in which they worked, but to the grace and power and plenitude of the structures wrought from those materials. With less hesitation, then, I change, in quest of strictly dramatic triumphs, from the time of Pericles to the period of Calderon, of Molière, of Shakspeare and his Elizabethan satellites. Lowell says that Pope and Dryden together made a man of genius. Terence and Plautus between them perhaps display the constituents of a master-playwright, but not, I think, of a strongly imaginative poet.

I have alluded to the process by which the epic and dramatic chieftains appear to reach their creative independence. As a preliminary, or at certain intervals of life, they seem to rid themselves of self-consciousness by its expression in lyrics, sonnets, and canzonets. Of this the minor works of Dante, Tasso, Boccaccio, Michelangelo, Cervantes, Calderon, Camoëns, Shakspeare are eminent examples. But nothing so indicates the unparalleled success of the last-named poet in this regard, as the fact that, unambiguous as are his style and method, and also his moral, civic, and social creeds, we gather so little of the man's inner and outer life from his plays alone: except as we seem to find all lives, all mankind, within himself—all experiences,

All thoughts, all passions, all delights,  
Whatever stirs this mortal frame;

and Coleridge, when he called him the myriad-minded, should have added, "because the myriad-lived."

THE grand drama, then, like the epic, gives us that "feigned history" which is truer than history as written, because it does not attempt to set things right. Its strength must be in ratio to its impersonality. It follows the method of life itself, which to the unthinking so often seems blind chance, so often unjust; and of which philosophers, reviewing the past, are scarcely able to form an ethical theory, and quite helpless to predicate a future. Scientifically, they doubt not—they must not doubt—that

<sup>1</sup> Professor Basil L. Gildersleeve.

Through the ages one increasing purpose  
runs,  
And the thoughts of men are widened with the  
process of the suns.

Right prevails in the end; crime brings punishment, though often to the innocent. We have seen that, if poets, they deal with phenomena, with the shows of things, and, as they see and faithfully portray these, the chances of life seem much at haphazard. Hamlet, for all his intellect and resolve, is the sport of circumstance. Rain still falls upon the just and the unjust. The natural law appears the wind of destiny. Man, in his conflicts with the elements, with tyranny, with superstition, with society, most of all with his own passions, is still frequently overthrown. It *seems* as if the good were not necessarily rewarded except by their own virtue, or, if self-respecting, except by their own pride, holding to the last; the evil are not cast down, unless by their own self-contempt, and the very evil flourish without conscience or remorse. The pull of the universe is upon us, physically as well as morally. When all goes well, and a fair ending is promised, then

Comes the blind Fury with the abhorred shears,  
And slits the thin-spun life.

Thus Nature, in her drama, has no temporary pity, no regret. She sets before us the plots of life, and its characters, just as they are. The plots may or may not be laid bare; the characters often reveal themselves in speech and action. As the stream rises no higher than its fount, the ideal dramatist is not more learned than his teacher. He may know no more than you of his personages' secrets. Thackeray confessed, you remember, that Miss Sharp was too deep for him.

Tragedy, according to Aristotle and in Dryden's English, is "an imitation of one entire, great, and probable action, not told but represented, which, by moving in us fear and pity, is conducive to the purging of those two passions in our minds." And so its reading of the book of life, even with our poor vision, is more disciplinary, more instructive in ethics and the conduct of life, than any theoretic preachment. The latter will be colored, more or less, by the temper of the preacher. Besides, through the exaltation to which we are lifted by the poet's large utterance, our vision is quickened: we see, however unconsciously, that earthly tragedies are of passing import—phenomenal, formative experiences in the measureless progress of the human soul; that life itself is a drama in which we are both spectators and participants; that, when the curtain falls, we may wake as from a dream, and enter upon a life beyond

terrestrial tragedies and which fears not even a disembodied phantom, "being a thing immortal as itself."

The Greeks conceived their gods to be almost as powerless as a human protagonist to divert the tides of circumstance, and postulated a Destiny above them all. The dramatists of Christendom, while also impelled to treat life as it is, its best and its worst, recognize no conflict between Deity and Destiny. Pagan and Christian alike present man, the image of his Maker, as exercising his highest function when he rises superior to fate. Thus Job rises, and thus rise Prometheus, Œdipus, Brutus, Hamlet, Wallenstein, Faust, Van Artevelde, and Gregory VII.; and likewise their fine heroic countertypes, Electra, Alcestis, Antigone, Cordelia, Desdemona, Thekla, Jeanne D'Arc, Doña Sol, and all the feminine martyrs of the grand drama.

In arguing that the strength of a play is in ratio to its objectivity, I assume, of course, that other things are equal. After all, the statements are the same, for only the poet endowed with insight and passion *can* give a truthful, forcible transcript of life. Otherwise many would outrank Shakspeare, being equally impersonal, more artistic in plot-structure, truer perhaps to history and to the possibilities of events. They often compose successful plays, striking as to incident and use of stage accessories: but more is required—the imagination that creates brave personalities, the cognate high poetic gifts—to make a composition entirely great. Add to such endowments the faculty of self-effacement, and Shakspeare stands at the head thus far. His period fitted him—one of action and adventurous zest rather than of introspection. At that time, moreover, literary fame and subsistence were won by play-writing. His mind caught fire by its own friction, as he wrote play after play directly for the stage, knowing himself to be in constant touch with the people for whom and from whom he drew his abundant types.

I HAVE often thought upon the relative stations of the various classes of poetry, and am disposed to deem eminence in the grand drama the supreme eminence; and this because, at its highest, the drama includes all other forms and classes, whether considered technically or essentially. Its plot requires as much inventive and constructive faculty as any epic or other narrative. Action is its glory, and characterization must be as various and vivid as life itself. The dialogue is written in the most noble, yet flexible measure of a language; if English, the blank verse that combines the freedom of prose with the stateliness of accentual rhythm. The gravest speech, the lightest and sweetest,

find their best vehicle in our unrhymed pentameter; again, a poetic drama contains songs and other interludes which exercise the lyrical gift so captivating in the works, for example, of our English playwrights: the Elizabethans having been lions in their heroics, eagles in their wisdom, and skylarks in their rare madrigals and part-songs. Tragedy and comedy alike are unlimited with respect to contrasts of incident and utterance, light and shadow of experience; they embrace whatsoever is poetic in mirth, woe, learning, law, religion—above all, in passion and action. So that the drama is like a stately architectural structure; a cathedral that includes every part essential to minor buildings, and calls upon the entire artistic brotherhood for its shape and beauty: upon the carver and the sculptor for its reliefs and imagery; upon the painter and the decorative artist for its wall-color and stained glass; upon the molder to fashion its altar-rail, and the founder to cast the bells that give out its knell or pæan to the land about. The drama is thus more inclusive than the epic. There is little in Homer that is not true to nature, but there is no phase of nature that is not in Shakspeare.

Analyze the components of a Shakspearean play, and you will see that I make no overstatement.

"The Tempest," a romantic play, is as notable as any for poetic quality and varied conception. It takes elemental nature for its scenes and background, the unbarred sky, the sea in storm and calm, the enchanted flowery isle, so

Full of noises,  
Sounds and sweet airs that give delight and hurt  
not.

The personages comprise many types—king, noble, sage, low-born sailor, boisterous vagabond, youth and maiden in the heyday of their innocent love. To them are superadded beings of the earth and air, Caliban and Ariel, creations of the purest imagination. All these reveal their natures by speech and action with a realism impossible to the tamer method of a narrative poem. Consider the poetic thought and diction: what can excel Prospero's vision of the world's dissolution that shall leave "not a rack behind," or his stately abjuration of the magic art? Listen, here and there, to the songs of his tricky spirit, his brave chick, Ariel: "Come unto these yellow sands," "Full fathom five thy father lies," "Where the bee sucks, there suck I." Then we have a play within a play, lightning and decorating it, the masque of Iris, Ceres, and Juno. I recapitulate these details to give a perfectly familiar illustration of the scope of the drama. True, this was Shakspeare, but the ideal should be studied in a masterpiece; and such a play as "The Tempest"

shows the possibilities of invention and imagination in the most sympathetic poetic form over which genius has extended its domain.

For one, I think that Sophocles and Shakspeare have taught us, by example, that greatness in the noblest of poetic structures must be impersonal. The magician must not directly appear; though, from reflecting upon a *Prospero*, a *Benedick*, or a *Hamlet*, we may guess at certain of his maker's traits; and in sooth he must know his own heart to read the heart of the world, even while he stands so far aloof that it may be said of him, as of one translated,

Far off is he—

No more subjected to the change and chance  
Of the unsteady planets.

Yet there is a subjective drama which, as we have learned in our day, is not without greatness derived from the unique genius of its constructor. The poet of England and Italy, whose ashes Venice has so recently surrendered to their shrine in Westminster, doubtless possessed a sturdier dramatic spirit than any Briton since the days of John Webster and John Ford. Browning was a masterful poet in his temper and insight, his flashes of power and passion, his metaphors, and distinguished for his recognition of national and historic types, his acceptance of life, his profound conviction that the system of things is all right, that we can trust it to the end. But his incessant recurrence to this conviction was a personal factor significant of many others. There are numerous and distinct characters in his repertory, but it requires study to apprehend them, for they have but one habit of speech, whatsoever their age or country. They all indulge, moreover, in that trick of self-analysis which Shakspeare confines to the soliloquies of special personages at critical moments. Even Browning's little maids study their own cases in the spirit of *Sordello* or *Paracelsus*. Finally, his whole work is characterized by a strangely individual style and atmosphere. True, it is difficult to mistake an excerpt from Shakspeare at his prime. But why is this? Because Shakspeare's style has unapproachable beauty, strength, flexibility, within the natural method of English verse; his inimitableness is due not to eccentricity, but to a grandeur of quality. His tone, characterization, and dialogue are as varied as nature. Browning's method hardly suggests either our native order of thought or nature's universality. It seems the result of a decision to compose in a peculiar way, but more likely is the honest reflex of his analytic mental processes. That at

times it is great, and above that of his contemporaries, must be acknowledged, for his intellect was of a high order.

Swinburne calls his plays "monodramas, or soliloquies of the spirit." The subjectivity which blends their various personages in a common atmosphere does not detract from the effect of his powerful dramatic lyrics and monologues, each the study of a single character. The most striking of these pieces,—their abundance is prodigal, and not one is without excuse for being,—from "My Last Duchess," "Bishop Blougram," "Childe Roland," "Saul," to "A Forgiveness," including nearly all the "Dramatic Lyrics," and "Men and Women," place him among the century's foremost masters. In such studies, and in certain of his dramas, he has created a new type of English poetry that is second only to the Elizabethan. His eminence is taken for granted when we begin to measure him, if only in contrast, by Shakspeare himself: a tribute rendered to scarcely any other poet save John Keats, and, in that instance, not on the score of mature dramatic quality, but for a diction so prophetic of what in time might be that the world thinks of his youthful shade among the blest as the one permitted to sit at Shakspeare's feet.

I spoke of our sovereign dramatist as being in spirit with his own people, and writing directly for their stage. Browning's earlier plays were written for enactment, and one or two were produced with some success. These, however, to my mind, are not his best work, and his most effective dramas are not, as we say, adapted to stage performance. Yet I rebuke myself, when repeating this cant of the coulisses, as I reflect upon the quality that does find vogue with managers and audiences at the present time. Who can predict what will be thought best "adapted to stage performance" when Jove lets down "in his golden chain the Age of better metal" for which Ben Jonson prayed—the age, at least, of different metal? Even now we follow a grand drama, though it be one of the outlived classical and recitative cast, with absorbed delight, when it is revived by a Salvini. But I believe that Browning himself would have written more and greater dramas, and of an impersonal order, if there had been a theatrical demand for his work after the performances of "Strafford" and "A Blot in the 'Scutcheon." Mischance, and the spirit of the time, may have lost to us a modern Shakspeare. As it is, we have gained a new avatar of dramatic poetry in the works of our Victorian Browning.

*Edmund Clarence Stedman.*

## TOPICS OF THE TIME.

### The People's Money.

WHAT is the best kind of money for the people — using the latter word in the sense in which it is employed by the advocates of free silver coinage? These advocates, like the champions of all other forms of cheap money during the past three centuries, speak of gold as the money of the rich, of bankers and money-lenders, of capitalists and rich corporations, whom they denominate “gold-bugs,” and whose center of activity is Wall street. All the remaining elements of the population are classed together as “the people,” to whom, it is now claimed, free silver is the money which would bring the largest measure of prosperity and happiness. Is this claim well founded; or is it, like all other alleged cheap-money benefits, a delusion founded partly upon ignorance of economic laws and principles, and partly upon private and personal greed?

The silver dollar which the free-coinage advocates desire to have bestowed upon the people is one containing  $371\frac{1}{4}$  grains of pure silver, worth in the markets of the world, at the present writing, about 70 cents. The proposition is that the United States government shall take this amount of silver, coin it free of charge, stamp it “one dollar,” and make it a legal tender for all public and private debts. That means that the United States shall pay \$1.29 an ounce for silver, in any and all amounts from any and every quarter, though the market price is only 90 cents an ounce, and shall make payment in legal-tender money interchangeable with gold at par.

What would be the first effect of the passage of this law? There is not an economist of any standing anywhere in the world who will not say that the first effect would be the disappearance of gold entirely from our circulation, and the descent of the country to the silver standard. The silver advocates claim that the mere passage of the law would force the price of silver from 90 cents up to \$1.29 an ounce, but there is no possibility of such an effect. They claim that silver has fallen in value because of its demonetization by nearly all the nations of the world, whereas the real cause is an enormous increase in production, and great improvements in mining, by which the cost of production has been diminished. The yearly average product of silver from 1851 to 1875 was \$51,000,000, and from 1876 to 1890 it was \$116,000,000, an increase of 127 per cent. The yearly average product of gold between 1851 and 1875 was \$127,000,000, and between 1876 and 1890 \$108,000,000, a decrease of 15 per cent. That is why gold has more than maintained its value, while silver has depreciated. In 1873 silver was worth \$1.30 an ounce, in 1874 it had dropped to \$1.27, in 1875 to \$1.24, and in 1876 to \$1.15. In 1877 a free-coinage bill was introduced in Congress, and in 1878 it was amended so as to provide for the coinage of not less than two million nor more than four million dollars' worth of silver bullion per month into dollars to be full legal tender at their nominal value. This was passed, vetoed by President Hayes, and passed over his veto. It was claimed that this would raise the price of silver. Since it became a law 405,000,000 silver dollars

have been coined, 348,000,000 of which are locked up in the Treasury vaults, never having passed into circulation. The price of silver dropped to \$1.12 an ounce in 1879, reached \$1.14 in 1880, \$1.13 in 1881 and 1882, fell to \$1.11 in 1883, to 99 cents in 1886, to 93½ cents in 1889, and to 90 cents in 1892. In 1890 Congress enacted a law which authorized the Secretary of the Treasury to purchase four and a half million ounces of silver bullion per month at the market price, and to give in return for it legal-tender notes redeemable in gold or silver at the option of the Government. Even this enforced purchase of 54,000,000 ounces of silver a year has not stayed the downward progress of the price.

A striking demonstration of the utter folly of the claim that free coinage would lift the price of silver from 90 cents to \$1.29 an ounce is made by Mr. Louis R. Ehrich of Colorado Springs, to whose luminous and valuable publications upon the silver question we are indebted for much exact information. At the time he wrote silver was 95 cents an ounce, but his demonstration is none the less effective. He says:

There is on our planet, in round figures, three billion nine hundred million dollars' worth of silver held as money or as a fund for money redemption. That is to-day all worth about 95 cents an ounce. Now these free-silver men tell us that the natural alchemy of free coinage by the United States all alone is going to raise these thirty-nine hundred millions from 95 cents to \$1.29. That is, it is going to add a value of over a billion dollars to the world's silver stock. Astonishing proposition!

All authorities agree that the silver of the world would be dumped almost in a body upon us, at the advanced coinage price which our Government would have to pay till we abandoned the gold standard, or gold went to a premium, which would be in a very short time after the law went into operation. We should then have only one kind of money, a dollar worth 70 cents, which every man who had a debt the payment of which was not stipulated to be in gold, could use to pay off 100 cents' worth of debt, and which every man who earned money in any way would have to receive for a 100 cents' worth of work. All debts would therefore be scaled down 30 per cent., except those with a gold-payment stipulation, and all wages, pensions, salaries, life-insurance policies, and savings-bank deposits would be cut down in the same way. There would be no escape. The dear money, gold, would be driven out of circulation by the cheaper money, silver, by the working of a law as inexorable as the law of gravitation.

Attention was called to this effect upon the pensioners of the Government in a circular which Congressman Harter of Ohio sent to all the Grand Army Posts a few weeks ago. In that he said:

If a *Free-Silver Bill* becomes law, a veteran who now gets a pension worth to him \$4.00 per month would receive *actually* but \$2.80, with the chance of it going down to an actual value of \$2.40. Take the case of a soldier who is a total physical wreck and utterly unable to do for himself. Such a man gets \$72.00 per month. If a *Free-Silver Bill* passes, while he would *nominally* get the same, he would really get but \$50.40, with a strong probability that in the early future his \$72.00 of monthly pension would be

worth not over \$43.20. This coinage question should not be one of party politics. It rises above partizanship. The honor of the country is at stake. Its business interests from ocean to ocean and from lake to gulf are jeopardized. Its good faith not only to its living soldiers is brought in question, but if a so-called free-coinage bill becomes law, the widows and orphans of the nation's dead will be robbed by the laws of the land they died to save. The law would work a monstrous wrong, for from the moment it goes upon the statute book it represents over \$45,000,000 per year taken from the ex-soldiers, their widows, and their orphans.

That would be the effect upon the pensioners, without a doubt. No man who has a rudimentary knowledge of economic laws can question that for a moment. Let us see what would be the effect upon savings-bank deposits and life-insurance policies.

There are deposited in our savings-banks sixteen hundred millions of dollars, a sum greater than the entire amount of money in active circulation in this country. These deposits are for the most part made up of small amounts, and represent the savings of the working-classes. Of these savings a thousand millions are invested in mortgages. Many of these mortgages are made payable in gold, but many others are not. Every one of them which has not a gold-paying clause can be paid off in silver; that is, the holder of it can be compelled to receive \$700 as full payment for every \$1000 of money lent. Is this honest or wise? Would a man who paid his honest debts in that way ever be able to secure another loan? Every mortgage in future would bear a gold-paying clause, and it would be very difficult to induce lenders who had been cheated once to trust the persons who had cheated them with a further loan on any terms.

Who are the lenders who would be cheated if mortgage indebtedness were to be paid in silver at 70 cents on a dollar? Are they "gold-bugs"? On the contrary, in many cases they are widows and orphans who are living on the hard earnings of industrious people, saved through many years of economy and toil. The "gold-bugs" have been merely the agents for the investment of this money, seeking for it a sure and safe return to the people who have put it in their care. The indispensable requisite for such return is the most sure and unvarying standard of value known to man — that is, the gold standard. The "gold-bug" who insists upon that is the truest possible friend and servant of the people, whether he be acting as their agent in lending them money, or investing and caring for it at the head of an insurance company, or in any other capacity. Rich men do not lend money; they borrow it — borrow it from the banks and insurance companies to invest it for their profit, and for the profit of its owners. They are the agents for all the money-savers of the land, seeking to win for them the best income possible upon their savings. They place the mortgages upon the western farms, and upon the buildings and other property in western cities, and the money which they use for that purpose is the money which the people, the workers and savers of the land, place in banks and insurance companies for their families and for use in their hour of need.

These are the people who would suffer by the swindle of making 70 cents do the work of a dollar by process of law. Every workingman in the land, every person drawing a salary, would suffer in the same way. He would receive the same number of dollars as before,

but each dollar would buy only 70 cents' worth of commodities. He is in fact a creditor for every day's or every week's work, and he is cheated of more than a third of his earnings if, when pay-day comes around, he must take \$7 in place of \$10, or \$14 in place of \$20.

The true "people's money" is the best money; that is, the money which will buy the most of what every man needs, and which will be worth the same this week as it was last, the same next year as this year. There is no security for savings of any kind with any other standard of value, no safety for loans, no interest on bank deposits. The man who declares cheap money in any form to be the "people's money" is the worst possible enemy of the people, for his policy, if carried out by the Government, would rob the people of a large portion of their hard-earned savings; would cut down their wages, and would throw the whole business of the country into confusion and doubt, sending paralysis and disaster into every industry and into every branch of trade and commerce. The worst sufferers would be the toilers of all kinds, the people of moderate means, and the poor. If the advocates of free coinage were honest in their contention that the country's welfare would be enhanced by having both silver and gold as a basis for its currency, they would consent to the coinage of a silver dollar worth 100 cents; but this they refuse to do. They refuse to accept an honest dollar, and insist upon a dishonest dollar. They are not serving the people, but are serving the devil, and the issue which they raise, far from being a political one, is a moral one of the first magnitude.

*No great party in the United States, in national convention assembled, will dare make itself responsible for the distress that would fall upon the masses of our population from free and unlimited silver coinage.*

#### The Machine versus the People.

It has been our custom for many years to discuss in this department of THE CENTURY questions of political science, that is, of politics in the widest and truest sense of the word, which is the attainment of that method of administering public affairs which will best promote the safety, peace, and prosperity of the whole people. Into the wrangles of partizan politics this magazine cannot enter. It can concern itself only with general movements and tendencies which promise on the one hand to promote the cause of good government, or threaten, on the other, to retard or even to destroy it. If in criticizing and condemning bad political methods and schemes for dishonest government we seem to be condemning any particular politician or class of politicians, the fault will not be with us, but with him or them; for the politician whose champions hasten to say that he is assailed whenever dishonest political methods are attacked, has become so identified with those methods that the public instinctively thinks of him when they are mentioned. No man gets a reputation of this kind save by his own conduct.

The most dangerous tendency in this country during the past twenty-five years has been the steadily increasing power of the political machines. From being the necessary organizations through which the voters of the great political parties were enabled to express their will in an orderly and authoritative manner, they have been developed into compact and disciplined bod-

ies of political workers, blindly subservient to a few leaders, or to a single leader or boss. Instead of registering the will of the whole party, a machine of this character uses all its power to suppress that will, and to force upon the party the will of the leaders or boss. The party is forced to acquiesce or to overthrow its own recognized organization and to subject itself to the danger of defeat. Rather than incur this danger, both political parties have frequently rallied to the support of notoriously unfit candidates for State and minor offices, and not infrequently have elected them. By general consensus of opinion, the harm which has been caused to good government in States and cities by this abuse of the legitimate use of political organization is incalculable. It has given the believers in popular government in all parts of the world serious misgivings as to its capabilities and its perpetuity—misgivings which we do not share, but which cannot be ignored.

This abuse of machine power is bad enough, and disastrous enough, when applied to State and municipal politics. If now it shall be extended to National politics, and if it shall prove strong enough to secure a presidential nomination by suppressing the will of a great party, the issue made will be so serious as to rise at once above politics and to become purely a question of morals. From the nature of the case this must be the outcome, for machine power is never exerted to extreme ends save in the interest of the worst and most objectionable politics.

We cannot illustrate this contention better than by enumerating the long-continued series of steps by which a politician of the machine type has advanced to the point at which a presidential nomination is sought to be captured for him. He begins his political career in the ward politics of a small city. He receives his elementary instruction in political methods from a professional corruptionist, and under this tutelage soon becomes an expert in debauching and perverting the suffrage. He is able to get himself elected to the State legislature, and while in that body forms an alliance with the greatest corruptionist of the time. From the legislature he advances by successive stages till he reaches the highest office in the State—becomes its chief executive. He wishes to be reelected, and needs money to help him to succeed in his purpose. He gives his personal notes for \$15,000 to the chairman of his party committee or machine. He has these notes converted into cash by inducing certain political friends to indorse them. The chairman of his machine, who happens to be a large contractor on one of the State's public works, subsequently pays both notes, and charges them against himself upon the books of his contracting firm. He uses his influence to induce a majority of the commission controlling a public work to award to the firm of contractors of which the chairman is a member a contract for which that firm's bid is \$54,000 higher than the lowest competing bid. When the contract has been awarded, it is immediately sold by the chairman to one of the lower competing bidders for \$30,000 clear profit, the chairman never having done any work under it. Thus the city has been robbed of \$54,000, and the machine chairman has obtained \$30,000 of it with which to pay himself for \$15,000 which he gave to the chief executive for the latter to use in his reelection.

Let us follow this career a little further. The term

of chief executive, lasting through a period of several years, is devoted to the most untiring and unscrupulous efforts for the building up and strengthening of his personal political machine. To this end the public service, all its offices and patronage, and all the power which the executive's veto-privilege confers over the members of the legislature, are used without scruple, and without regard to anything save the individual advantage of the executive. The most intimate relations are established by the executive with the liquor interests of the State, and with the most unruly and dishonest elements of the population in all the cities. No legislation restricting the spread of liquor-selling is permitted to become law, and all legislation in the interest of honest elections and a secret and untrammelled ballot is either vetoed or, through executive opposition, injuriously modified—as is demonstrated when finally put into practice. So successful are these years of machine-constructing, that when the term of the executive draws near its end he is able to order and secure his own election to a senatorship of the United States. As he wishes to make that a stepping-stone to a presidential nomination, he does not go to Washington, but retains possession of both senatorship and governorship at the same time, in order to maintain his control upon his machine. When the election of his successor has been held, and it is found that his party has a majority in one branch of the legislature but not in the other, he at once sets his machine in motion to capture control of the other by manipulating canvassing boards. He is overruled by the courts, and he denounces and defies them. Some of the legal returns are abstracted from the delivered mails in the State offices before they can reach the final canvassing officers, and thus it is made possible for those canvassing officers to count as legal a return which the highest court in the State had declared to be illegal, thereby getting full possession of the legislature. To the most shameless of the minor State officers who help in this theft is awarded, through a subservient successor in the governorship, a judgeship on the bench of the highest court in the State, whose decrees have been defied.

With this theft of a legislature as his crowning achievement he announces himself a candidate for the presidency, his champions pointing with pride to that as his strongest claim upon his party for its highest honor. He then sets his perfected machine in motion to commit his State to his candidacy; calls a convention at an unusual date; leaves his seat in the Senate and personally directs the machine in its work of packing and running his convention; and when all is done appears before the delegates and thanks them for the honor which he has bid them confer upon himself.

When the candidacy has been launched before the country on this record and in this manner, let us suppose that this aspirant for the presidency goes into every State, either personally or by means of his agents, and inspires the political elements in each which correspond to those behind him in his own State to go to work by similar methods to defeat the will of the whole party in the national convention, forming, as it were, a compact union of all the worst members of the party for the defeat of the wishes of all the other members.

Does not a manifestation of machine power like this call for serious attention from all honest men, no matter what their political faith may be? Can a presi-

dential nomination be sought by such a man and with such methods, and not raise an issue of morals in politics in which the whole country will take a vital interest? No American who has faith in his country and in its capacity for self-government believes it possible that, if such a candidate were to succeed in forcing his nomination upon a party, he could be elected. The moral sense of the country would be so aroused by the insult that it would sweep away all party lines, and unite all honest men in a grand committee of safety to defend the nation's honor from so base an assault. It would be a national disgrace for a great party to confer a nomination upon such a candidate, for its doing so would be a confession that half the voters of the country were in slavery to machine rule; but when the righteous indignation of the people made itself heard at the polls, the disgrace would be wiped out forever.

#### Regularity and Independence.

THE most useful word in the vocabulary of the man who makes a mere business of politics is "regularity." The "regular" politician, when he sincerely desires votes for his side, is eloquent in calling upon every man of character, principle, and independence to cease voting for the other party, and to come and vote for the politician's party. In fact the calls to national conventions of all parties are largely made up of such appeals,<sup>1</sup> and are based upon the idea that a human being not only can, but should, think independently and vote independently. It is only when this independence becomes troublesome that men of independence of character are covered with the politician's inelegant abuse.

And yet there is nobody more irregular than a regular politician of the unprincipled sort. He is essentially and brazenly irregular. His very rules are often constructed for entirely irregular purposes. While making certain apparent use of rules, his whole scheming is against rule; that is, he lends all his energies to falsify public opinion; he misrepresents majorities; he is autocratic, tyrannical, and purely self-seeking. The securing of fair dealing and just regularity is the very life and intent of rules; whereas this is exactly what the regular politician labors, through his use of regulations, to avoid. We say through his use of regulations; but it is notorious that nobody can break his own rules with more effrontery than the most pedantic of regulars.

<sup>1</sup> See "Partisan Recognition of the Independent Voter," Topics of the Time for October, 1890.

As for independence, there is no one, in a sense, so independent as the regular politician. It is he (with the assistance, perhaps, of a little group of cronies) who decides—often with complete indifference to public opinion—what shall be the "principles" of a party, and who shall be its candidates at any given election. When the regular politician, therefore, denounces independence and irregularity, he does it with his tongue in his cheek; and yet there are good men who are innocently beguiled by this sort of talk at every election.

We are not of those who denounce the idea of party. Every good movement, every valuable idea in human progress, tends to the formation of a party and the breeding of partisans. Primarily a party is nothing other than the association of men to put into practice some principle of government to which they are attached. It is only when party names are degraded to mere pretexts for plunder and means of selfish aggrandizement that they become a menace to the public good; and that this is the tendency of all large political associations history proves.

It happens that in the career of every great party a moment arrives when the mere machine politician endeavors to use an organization sacred to a purpose and a cause for ends solely personal and corrupt. In other words, a moral crisis is sure to arrive in the course of every political association. Then comes throughout the length and breadth of the land a sure test of clear vision and integrity. One of the saddest sights at such an epoch is the pitiful and apologizing use of clean reputations for the bolstering of sordid causes; the alliance of fair and cherished fames with all that is sinister in the forces that influence the destinies of a people. Look around, and look back over the political history of America! It is always so. The weakly good, and the cynically and selfishly decent, just at the time when designing and corrupt manipulators should be opposed by all the strength of public opinion, lend their names and services to the cause of immorality, and conspire with evil men for the degradation of government. But discouraging as is this melancholy phenomenon, there is always deep encouragement in the spectacle presented in moral crises such as we have described of brave and cool-headed independence, of unselfish devotion to principle, of right feeling showing itself often in unexpected places, of wide-spread enthusiasm for moral ideals, and for sound and elevated views of public duty.

## OPEN LETTERS.

### The German Emperor and the Russian Menace.

THE German Emperor shares with the best-informed men in his army the belief that Russia intends to attack him at the earliest convenient opportunity. It is not the Czar who is urging war. Those who know that monarch well scout the idea. He loves peace and quiet, and does not wish to be disturbed. How long he can make his personal wishes prevail we cannot say, for he may have to choose between war and disquieting agitation. His ministers, who see more clearly than their master, realize that the economic condition of Russia has been going from bad to worse under a system of protection and repression that has no parallel in mod-

ern times. Commercial enterprise is hampered by a swarm of police, who are able to levy blackmail upon any tradesman who is not "protected." Inquiry of every kind is carefully stifled, and even French newspapers are "blacked out" by the censor if they contain news contrary to police wishes. Popular discontent exists, and it is the object of the Government to divert attention from domestic affairs to the enemy beyond.

Russia's active hatred of Germany dates from 1878, and is one of the many legacies of the Bismarck era. Every one remembers that the Russian army was in sight of Constantinople, and was prepared to take pos-

session, when England interfered. The Russians returned from the war expecting to receive at the Berlin Congress, in a diplomatic way, all that they had given up on the battle-field. In this they were mistaken, and their ambassador returned from Berlin to tell his people that the fruits of the war of 1877 had been lost to them through German perfidy. From that day to this hatred of Germany has been preached as the national gospel of Russia, and in this hatred have been included Jews, Poles, Swedes, Finns—in short, all the unorthodox whose civilization draws inspiration from the western neighbor. "Russia for the Russians!" is now the cry, and the orthodox Russian Church shouts louder than any one in the congregation.

The famine which spread over part of Russia last year does not abate this cry of revenge. On the contrary, there is not a peasant who does not believe that in some mysterious way the heretic Jew or German is responsible for his misery, and for that matter German and Jew are one to him, for both are unorthodox, both un-Russian. With this aspect of the case in mind, it seems strange indeed that the government of Russia should be acting in a manner to alienate the sympathy of subjects on her western frontier. It is possible that the Czar's ministers disapprove of the extreme measures taken in the Baltic provinces to expunge the German language and the Lutheran faith, but they know the power of the orthodox clergy, and dare not resist the only expression of what has to pass for public opinion.

The famine in Russia is real, although it is equally true that there is always a failure of crops somewhere in a country so vast. I lost no opportunity during the height of the newspaper discussion of the subject to make inquiry in proper quarters regarding the nature and extent of the alleged distress. The Government seems incapable of giving friends of Russia any satisfactory idea of the situation, and, worst of all, does not inspire any great confidence in the breasts of sympathizers. One day a minister reports that the famine is of no serious character; soon afterward the press announces that twenty millions of people are perishing. In any event, the situation is not cheering, famine or no famine.

If, however, a famine really exists on a large scale, then is there all the more reason to expect war. The peasant suffers first; next suffers the storekeeper, who supplies the few things the peasant cannot make himself; next suffers the wholesale dealer, who gets no more orders; next suffer the merchant and the banker of the capital and the seaport; at last suffers the only one worth considering—the Government, which feels it finally in the confession of hundreds and thousands of police officials that the peasant has been taxed to his last copeck. At this point the news becomes serious, for the Government is a costly one, and only money can sustain it: money for the interest on a huge public debt; money for the huge military machine; money for the police; money for the imperial family; money for secret service; money to maintain political jails; money to guard prisoners on the way to the mines of Siberia. When the Government finds that money is wanting to sustain its prestige, and that empty stomachs are growling, it may choose war as the lesser evil.

Germany is not blind to the dangers that threaten her, particularly from France. She will have one army on the Rhine, another on the Vistula. Von Moltke clearly

foresaw the intention of Russia to attack, and never failed to urge upon William I. the military necessity of forcing the war as soon as possible. His reasons, of course, were purely military. "Russia," he argued in 1875, "is arming against us; each year she becomes more formidable. We, on the contrary, remain stationary. Our duty is to fight now, while the heroes of 1870 are still fresh, and not wait until they are retired from active service." Von Moltke saw more clearly than Bismarck. William I. was old, and relied on his prime minister, who kept telling him that Russia was Germany's natural ally; that Russia must be humored at any cost. On the part of the venerable William I. there were strong family reasons dictating friendship for the Russian Czar; but this does not explain Bismarck's apparent indifference to the fact that, for the last fifteen years, Russia has been cultivating hatred of Germany, second only to that prevailing in France.

The present German Emperor foreshadowed Russia's attitude of to-day three years before he came to the throne. He has been nearly four years in power, and has not only not declared war, but has not made a single warlike demonstration of a practical kind. His military family, if I may use the expression, are ready to anticipate the blow of Russia; but Germany keeps the peace because her Emperor is too conscientious to precipitate the conflict. Personally he is deeply pained by the hostile attitude of the Russian government; his efforts in the direction of closer commercial intercourse have been met by sullen objection; he has been treated with personal discourtesy by the Czar; his own people are outraged by the daily account of persecution to which Germans in Russia are subjected; he knows that the line of the Narew, the Niemen, and the Vistula is fortified by a chain of strong forts, and that Kirghis Cossacks patrol all the roads crossing his frontier. He is perfectly well aware that France is ready to cooperate with Russia, and that her forces are better organized than ever before.

The German Emperor is not unpopular in Germany. This fact cannot be too strongly presented, because many important consequences flow from it. He has done many things to disquiet moderate Liberals; has done things indicating a disposition to assume responsibility which might better be shared with Parliament. He has made many impromptu speeches which a prime minister would cheerfully have recalled; he has written texts which a strictly constitutional ruler would wish relegated to privacy. Granted all this and much more, for the sake of argument, let us come to what he has positively done, in order to understand why, in spite of this, he is Emperor in the German heart as well as in the German army. He has shown himself accessible to complaints from all classes of the community, and has interested himself in remedies; he has abolished the special laws against socialism with most excellent results; he has removed much of the irritation on the French frontier; he has met the grievances of the Polish Prussians in the same spirit; he has shown a liberality in dealing with the press and platform agitators unknown in Bismarck's day; he has inaugurated a commercial policy which, if not free trade, is a complete denial of the principle that one class has a right to enrich itself at the expense of another; he has drawn together the trade relations of Germans so wisely that Vienna, Budapest, and Berlin seem now like sister cities

of a free federation, and has spread the blessing of commercial freedom more widely than was ever before known in Europe; he has instituted legislation for the benefit of wage-earners and wage-payers, not as a socialist, but in the spirit of arbitration and fair play. In all of this he has moved independently, fearlessly, moderately, and in opposition, not merely to the teachings of Bismarck, but to the school of politicians created for him by that master of medievalism. Not only this, but he has interfered energetically on behalf of the soldier in the ranks; has insisted upon his troops being treated with proper respect by officers, and particularly by corporals and sergeants. He has vigorously put down gambling and fast living among his officers; he has at last interfered on behalf of the overworked school-children, and is the first to say that a teacher shall not cram the pupil's brain at the expense of general health.

All this sounds as though a stroke of the pen could make such reforms real, but it is not so. All academic Germany sets its face against school-reform, and the utmost exercise of tact and persistence is necessary on the part of the Emperor to make his proposals bear fruit. These instances suggest some of the reasons why Germans respect their Emperor. There are others of a negative kind. For instance, we have yet to hear of anything he has done for the gratification of selfish tastes. He is a plain liver; he has never indulged in the vices sometimes associated with royalty; no officer in his army can say that the Emperor taught him to gamble; in his family he is exactly what a German would wish him to be; and the keenest sportsman could not wish a better companion. Finally, he is a thorough soldier: he has served from the ranks up; he can do sentry duty with a guardsman, and can also manœuvre combined army corps according to the principles of strategy and modern tactics. He has his faults, and none sees them so well as the German general and the German parliamentarian. But he has elements of strength and popularity which vastly outbalance any faults so far discovered—and this is what outside critics are apt to ignore. He has sources of strength totally closed to the Czar. The Kaiser is a man of flesh and

blood; he feels as a German; his work is in harmony with the spirit of German progress; his failings, such as he shows, are German. There is no German who does not admire him in his private relations, even though differing from him in matters official; and we all know that in times of political danger the people are drawn to the man of strong personal character rather than to the cautious and colorless figurehead.

The forces behind William II. are such as have never been cultivated in Russia, whose Czar lives in hourly dread of assassination, and whose people are so many items of an official budget, so many units in a military report. The German Emperor walks about the streets of his towns as fearlessly and naturally as any other man, although the life of his grandfather was twice attempted. One day, in November of 1891, he was walking with a guest through the narrow and crowded thoroughfare of a city not far from Berlin. The side walks were narrow, and, as the Emperor is a fast walker, he frequently had to step out into the street to pass other pedestrians, and especially clusters of people who stopped for a chat. His companion, who had been in Russia, was struck by the democratic manner in which the German Emperor rubbed in and out amongst porters, fish-wives, peasants, and the rest of the moving crowd, chatting the while, and acting as though this was his usual manner of getting about. He was struck still more by the fact that no precautions against a possible murderous fanatic appeared to have been taken, and ventured to speak of this. The Emperor laughed heartily, and said: "Oh, if I had to stop to think of such things, I should never get through with my day's work."

It is with this man that Russia will have to reckon when her Cossacks start for Berlin; and this man is strong, not merely because he represents a strong army and a strong political administration, but because in him center the feelings of unity and development, of pride of achievement, and of promise of a still greater future which lie dormant in the hearts of those who regard Germany as the bulwark of civilization against barbarism—Europe against Asia.

## IN LIGHTER VEIN.

### The Sleeping-Car.

CELUM NON ANIMUM MUTANT.

WE lie with senses lulled and still  
'Twixt dream and thought, 'twixt night and  
day,

While smoke and steam their office fill  
To bear our prostrate forms away.

The stars, the clouds, the mountains, all  
Glide by us through the midnight deep;  
The names of slumbering cities fall  
Like feathers from the wings of sleep.

Till at the last, in morning light,  
Beneath an alien sky we stand;  
Vast spaces traversed in a night;  
Another clime, another land.

*T. W. Higginson.*

### The Arbutus.

ARBUTE, blossom of the May,

Thou and the wind together  
Make, whatever the almanacs say,

The spirit's brightest weather.  
When youth is gone and fancy flown,  
When thought doth little and dwells alone,  
The blooming foot-paths open a way  
To many a long-past holiday.  
Though youth be flown and fancy gone,  
The mind's sweet memories may live on.  
Only let the south wind blow,

Thou and the South together;  
For thou and the balmy south wind make  
The spirit's brightest weather.

*James Herbert Morse.*

Charlie and the Possum.

It was a day of great excitement in the court-room of the 2057th District, G. M. Charlie Brood had been arrested for larceny, the particular charge being that he had stolen a possum and a steel trap, the property of Peter Thompson. Charlie having demanded that he be tried by a jury of his peers, the justice, with that accommodating spirit peculiar to some backwoods officers, had called in six colored gentlemen as a jury, arraigned the prisoner, and put the prosecutor under oath

nigger den, I would n' er be'n hyah now, an' he would n' nuther. I'd er kill 'im right deir!

"Well, sah, I run t'rough dem fiel's like er man's tracks; las' I struck de railroad. I look dis way an' I look dat way, an' den I saw dis hyah nigger wid er bag on es shoulder 'way down de railroad. Fus news he know, I was deir. I say, says I, 'Mornin', Charlie,' des so. An' he say:

"Mornin'."

"How you do?" says I.

"I 'm toler'ble,' says 'e. 'How you do?'"

“DOES YOU WAN TER GIT EN CHARLIE'S WARM BAG?”

to tell the truth, the whole truth, and nothing but the truth. As Peter Thompson laid his aged lips upon the well-worn Bible, he rolled the white of his eyes into prominence and let fall an ominous glance upon the prisoner at the bar, who had sunk down into his chair until the top of his shoulders was about level with his ears.

"Jedge, I tell you how hit was," the witness began. "I drives er dray fer Marse Mansfiel' up en Macon, an' I works hard. I ain' got no time ter hunt up deir; I got er wife an' fambly ter tek cyah of. So when I come down hyah ter my aunt's fun'al, I fetch erlong er trap ter sot out, 'cause nigger 'bleege ter hab possum some time. An' I sot hit out en de fur corner of er corn-fiel' en de edge er de swamp, by er black-gum tree, ter catch er possum. I ain' got but fo' days down hyah, Jedge, an' I go ter dat trap ev'y mornin' 'bout day, 'spectin' ter fin' er possum deir ter tek home ter my wife an' fambly. Las', one mornin' I go deir an' I see possum signs all ober der place. I say, 'Peter, bless goodness! dat sho big-bo' possum.' Den I say 'g'in, 'Huh, dat strong possum! Done tote trap off.' But I knowed 'e ain' tote hit fur, an' I 'gin ter look erbout. I look, an' I look, an' I look. Ain' see no possum nowhar! Den bimeby I see nigger track, an' 'bout dat time I know wha' de matter. I was sho mad. I des tek dat trail like er houn' dog. Jedge, ef I had er-cotch dat

"An' I up an' say, 'I 'm toler'ble.' He don't say no more, an' bimeby I up an' come erg'in:

"What you got en dat bag, Charlie?" Den 'e say:

"Unc' Peter, I so tired. Be'n 'way down ter de station ter git my wife some 'taters. She mighty sick, an' hank'rin' atter 'taters, an' our 'taters all got de dry rot.' He ain' answer de question, Jedge, an' I gi' hit ter 'im erg'in. Says I:

"What you got en dat bag, Charlie?"

"Den 'e say, 'Hit 's er long way ter de station, an' ef my wife had n' be'n sick she'd hatter done 'thout 'taters.'

"Jedge, 'e ain' say 'taters en de bag: des keep on talk'n' roun' 'bout es sick wife an' bein' tired. Den I wan' ter see how big er liar de nigger kin be, an' I ax de question erg'in. 'Bout dat time, while he was studyin' up er new lie, I see de possum twist en de bag, an' right deir I re'ch out my han' an' grab de bag f'om 'im, an' shek hit, 'cause I was determ' ter see what en dat bag. He ain' try ter hender me, an' he better not, 'cause ef 'e had, deir 'd er b'en er rookus right deir. Well, Jedge, I shuk, an' I shuk, an' I shuk, but nuthin' drap. An' den I say:

"Charlie, look like dem 'taters mus' hab toofs an' toc-nails ter hol' on wid.' An' I shuk erg'in.

"Charlie,' says I, des so, 'mebbe dem 'taters got de tail wrap' roun' er knot en de bag'; an' wi' dat I turn

hit wrong side out, an' down drap de possum wid he foot en de trap. De lyn' nigger threw up bofe han's, an' say:

"'Lordy mussy! what dat possum gwine do wid dat trap?'

"Jedge, I done eat dat possum; hyah he foot en de trap, hyah de trap, an' deir de nigger. He ain' done me right, no 'e ain'."

There was silence for a few moments. Fingal Cave Scotland, the oldest man on the jury, bent his gray head down close to the ear of Obadiah Lafayette and whispered solemnly. The face of the Rev. Septimus Smith, who sat at the other end of the jury, was grave. Others exchanged comments. Evidently it was a threatening moment for Charlie, but Charlie came to the stand smilingly.

"Hit 's des lak dis, Jedge," he began. "I ain' no town nigger, an' I 'm proud er de troof. I ain' so triffin' I cyan't git work whar I was borned, an' hat ter run ter town. An' I 'm proud er de troof erg'in. Dese hyah town niggers"—and all eyes were directed toward the late witness—"dey 'low as how dey own de whole wor' an' ev'y'ting dat wears hair er feeders fom hen-roos' ter possum holler. Dey ain' satisfy en town; dey mus' come down hyah an' bre'k up de olete-time huntin' an' fishin' wi' dey trappings an' dey nets. Ef dey 'd come lak er white man an' hunt wid er dog an' er gun, hit 'u'd er be'n diffunt, an' folks 'u'd had some 'spec' fur 'em. Ain' dat so, Unc' Finger?'"

This appeal to the prejudices of the country negro had an immediate effect upon the jury.

"Hit sho es de troof," replied Fingal; and his companions seemed to coincide with him. The prisoner continued:

"Jedge, I sort er like possum merse'f, but I ain' sot no trap. I hunt 'im wid de dog an' de torch like er man. Dat night I was out tryin' ter show er fool puppy how ter trail, an' bimeby he opened up an' lit out. I says ter merse'f, 'Charlie, you gwine ter hab possum fur dinner.' An' 'bout dat time I des natch'lly laugh out loud. 'You gwine ter hab barbecue possum,' says I. Jedge, I see dat possum right 'fo' me en de dish, brown all over."

A slight shudder shook the form of the Rev. Septimus Smith, and a momentary sensation swayed the other jurymen. It was as a little breeze wandering in among sleepy rushes.

"I seed dem split sweet 'taters roun' dat possum like er yaller hawberry chain roun' er nigger gal's neck. I seed de brown gravy leakin' down es sides as 'e lay deir cryin' fur joy all ober, an' er jug er 'simon-beer—"

"Hyah! hyah! hyah! hyah-h-h-h! Hyah! hyah! hyah! Hoo-ee-e!"

This explosion came from Fingal Cave Scotland, who doubled up, and would have fallen out of the chair but for the restraining hand of his next neighbor. The sensation was complete; the little breeze had become a whirlwind.

The court administered a ponderous rebuke, and the witness proceeded:

"Hit was des dat way, Jedge; an' I hope yo' Hono' ain' t'ink hard er Unc' Finger fur his natch'l feelin's, 'cause las' possum I taste hit war fixed up an' on es table like I tell yer. An' dey'd de deir more

oftener ef hit war n't fur dese hyah biggitty town niggers an' dey traps."

"Go on with your story." The judge rapped the table with his knuckles.

"Yes, sir. Well, Jedge, by dat time de fool puppy plum' out er hearin', an' I knowed he done struck er fox. Hit was de 'July' blood en 'im. I 'gin ter look roun' fur home, 'cause day breakin', when I stumble on sumpin', an', bless God! deir was de possum settin' right 'fo' me. I says, 'Charlie, hyah possum de Lord sot you.' Possum he settin' up deir by esse'f, an' eyes des er-shinin'. I says: 'Huh! dis possum he sick. No, possum ain' sick; he des too fat ter trabbel. I sho eat dis possum.' Den I look erg'in. Dah, now! Possum hitch en er trap! I say ter merse'f, 'Charlie, dis ain' yo' possum; dis somebody else's possum. You ain' gwine tek 'n'er man's possum, is you?' Den I say, 'No; course I ain' gwine tek dis hyah possum! What I want wid 'n'er man's possum?' an' walk right off, sort er singin' ter merse'f, 'Racon tail am ringed all roun'."

"I git 'bout fifteen foot erway, an' den I kin' er natch'lly look back, an', Jedge, hit 's God's troof, dat little ole possum settin' back deir on dat trap look so col' an' shiv'rin', I feel sorry fur 'im—settin' back deir 'way out en de wet swamp so col' an' lonesome, an' de owls des er-hollerin' an' de heel-taps er-hammerin' up en de dead trees. I says ter merse'f: 'Charlie, you sho ain' gwine lef' dat po' little possum out hyah all by esse'f en de bigswamp, es you? Sumpin' bou'n' ter catch 'im sho.' Den I says: 'Who 'e belong ter, anyhow? Did de man wha' sot dat trap raise 'im? Does dat man own dis hyah lan'? Does 'e own de holler tree dis hyah po' little wand'rin' possum born en? No; 'e don't,' says I. 'Possum is es own boss.' Den I go back an' look 'im en de eye, an' I say, 'Little possum, you col', ain't you?' An', bless goodness! he smile cl'ar back twell es jaw-toof shine. An' I says, 'Does you wan' ter git en Charlie's warm bag an' go 'long back ter sleep?' An' 'e smile erg'in. An' I says, 'All right; but how 'bout dat trap?' An', Jedge, den dat possum look se'ious, an' lay es nose down on es leg. I tell 'im den: 'Little possum, Charlie ain' gwine lef' you out hyah en de col', an' you be'n up all night. He gwine ter drap you en de bag, 'cause you yo' own boss an' kin come an' go; but ef you fetch dat trap erlong, hits yo' own 'sponsibleness. Charlie ain' got no business ter tech 'n'er man's trap. But I gwine shet bofe eyes, an' deir won' be no witness."

"Den de possum he smile erway back erg'in, an' I drap 'im en de bag, bofe eyes shet. An', Jedge, dat 's de Lord's troof. I ain' tech dat trap. Deir hit es down deir on de flo', wi' de possum han' still on hit. I ain' git er smell er dat possum, an' I ain' stole nuthin'."

There was a murmur of applause as Charlie concluded, but this was quickly repressed. The justice, putting on his glasses, read the law as to wild animals to the jury, and explained what was meant by larceny; and the jury retired. When they returned they brought in a verdict of "Not guilty." This was explained afterward by the Rev. Septimus Smith. He said that the jury was clearly of the opinion that a possum was no man's property until actually in his possession, and that if the trap was stolen, it had been stolen by the possum and not by Charlie Brood.

## BUDAPEST.

### THE RISE OF A NEW METROPOLIS.

WITH PICTURES BY JOSEPH PENNELL.

THE SUSPENSION-BRIDGE.

TO the world at large, Budapest, the capital and metropolis of Hungary, is the least known of all the important cities of Europe. No other falls so far short of receiving the appreciation it merits. Several reasons may be assigned for this comparative obscurity; among which are remoteness from the chief thoroughfares of travel and commerce, the isolation of the Magyar language and literature, and the subordination of all things Hungarian to the Austrian name and fame. But the most important reason is the simplest of all: the Budapest of to-day is so new that the world has not had time to make its acquaintance. Its people justly claim for it the most rapid growth in recent years of all the European capitals,

and are fond of likening its wonderful expansion to that of San Francisco, Chicago, and other American cities.

When Kossuth found refuge in America forty years ago, after Hungary's tragical struggle for independence, the sister towns of Buda and Pest, lying on opposite sides of the Danube, together had hardly more than a hundred thousand people. The consolidated municipality has now a population of fully half a million. But remarkable as is the increase of population, it seems to me far less remarkable than the physical and architectural transformations that have accompanied the town's

growth in numbers. Budapest is not merely three or more times as populous as it was in the middle of the current century, but it has blossomed out of primitive and forlorn conditions into the full magnificence of a splendidly appointed modern metropolis. Rapidly developing cities usually have the misfortune to grow wrongly, through lack of foresight and wise regulations on the part of the governing authorities. Budapest has not wholly escaped; but it would be hard to find another large town whose development has been kept so well in hand by the authorities, and has been so symmetrical and scientific from the point of view of approved city-making. In many particulars of appointment, as well as in general plan and *tout en-*

semble, American cities might learn not a little from Budapest.

Political reasons have quite as much to do as commercial causes with the making and unmaking of European cities. Thus Vienna, which may well contest with Paris the claim to pre-eminence for beauty and splendor, owes everything to the political events that followed the revolutionary movements of 1848. Vienna became the seat of government of a newly organized empire, and acquired a most liberal municipal constitution. Its prestige grew enormously, and it absorbed wealth and population from all parts of the Austrian dominions. The imperial Government and the municipal authorities vied with one another in projects

of necessity as united as those of a single empire; but the delegations from the two parliaments which meet annually to vote the joint budget, and to order the joint services, sit in alternate years at Vienna and Budapest.

It is true that the Emperor's ordinary residence is in Vienna, and that Vienna is the seat of administration of the confederated empire; but the Emperor is careful to spend much of his time, with his family and his court, in Hungary. In short, politically the two capitals are as nearly on a par as it is possible to make them. This change in the political wind had a most surprising effect upon Budapest. Hungary was at last free and self-governing, and in possession of liberal institutions. The hopes

THE ACADEMY.

for the embellishment of the capital, the chief of these projects being the Ringstrasse and its incomparable array of public buildings. Meanwhile Hungary was chafing under the disappointment and humiliation of defeat, and was making little, if any, progress. But the Austro-Prussian war of 1866 humiliated in turn the so-called "oppressor" of Hungary. The Hungarians were now in a position to demand a "new deal." To the wise counsel of the Hungarian patriot and sage Francis Deák, one of the great men of modern times, is due the fact that, instead of absolute separation from Austria, Hungary accepted the form of dual monarchy that has existed since 1868. Hungary became a constitutional monarchy of the most liberal sort, having its own parliament, its own cabinet, its own entire administration, with Budapest as capital. The Emperor of Austria became King of Hungary. The two parts of the confederation were absolutely coordinate. Their military and diplomatic services were

of 1848 were now to find realization. The whole life of the nation was invigorated, and that life centered in the capital. Ambitious young politicians had no longer to seek a career in Vienna. Home rule gave them full scope in Budapest. Social life was also awakened. The Hungarian nobles, who, with every other element in the population of the empire, had been contributing to the architectural splendor and social brilliancy of Vienna, were now disposed to build their palaces in their own capital; for they had acquired seats in the upper house of the Hungarian parliament, while Vienna was henceforth to be regarded as their capital hardly more than Berlin or Paris. The transformation and embellishment of Vienna as the sole capital of Francis Joseph's dominions had just begun fairly to show results, when the new order of things cut those dominions in two, and made Budapest the rival capital, with slightly the larger of the two territorial divisions. It is true that Hungary had a smaller

population, and industrially was far less advanced than the provinces of which Vienna remained the capital; but the curtailment was obviously detrimental to Vienna in many ways. Moreover, Vienna has felt the effects of decentralizing tendencies in the provinces remaining to her; for the Bohemians are developing their beautiful local capital, Prague, and the Austrian Poles are expending their energies upon their own Cracow. In Hungary, on the other hand, Budapest has no rivals; all roads lead to the capital. There is in Hungary a compactness and unity that form a marked contrast with the scattered and discordant provinces which have their political center in Vienna. Budapest is now the capital of a nation of seventeen millions of progressive and ambitious people, and this new political fact is of itself sufficient to account for much of its growth.

The commercial conditions also are not to be overlooked. Hungary is an agricultural country, lying for the most part in the rich valley of the Danube and its principal tributaries. Central Hungary is a vast level plain, an uninterrupted stretch of cultivated fields. One rides across it late in June or early in July to find it looking much like Illinois or Iowa, the chief crops being wheat, maize, oats, barley, and hay, growing luxuriantly, and extending as far as the eye can reach, without fences to break the sweep of vision. In these favored recent times the agricultural production has much increased, and Budapest is the market for the farm surplusage. As a grain-receiving point it is to the Hungarian plain what Chicago is to Illinois and Iowa, or what Minneapolis is to Minnesota and Dakota. It is hard to realize how commercially undeveloped all this Hungarian country was only a few years ago, and what meager facilities it had for reaching the markets of Europe with its surplus food-products. The new Hungarian government set itself to work to develop agriculture and trade, without any

particular fear of being charged with socialistic activities. Somebody had to take the initiative. The country was poor and without capital. To secure a system of railroads it was necessary to grant heavy subsidies to English, French, and German capitalists, who formed companies and established lines. But the Government found subsequently that it could better afford to take over the roads, and put them under a consolidated public administration, than to pay annual subsidies to a dozen private companies. The results have justified its policy. In every possible way the Government has made the state railway system conduce to the development of Hungarian industries. Under the railway administration there has been established at Budapest a great government manufactory, not only of loco-

DOME OF THE CATHEDRAL.

ENGRAVED BY G. NAYLOR.

motives, but of all sorts of heavy machinery, including agricultural machines, a special product being threshing-machines. It is only recently that machinery has been introduced in the farming operations of southeastern Europe, and the innovation makes headway somewhat slowly against the prejudices of the peasantry. Thus, in a recent summer, in the hay-fields of the Hungarian plain, I saw many a row of

river improvements have been made at Budapest, to which I shall again refer. While the growth of Budapest has been influenced by causes already described, it has also been aided by the development of the flour-milling industry. Within twenty years the processes of flour-making throughout the world have been revolutionized by reason of certain Hungarian inventions, of which the most important is the

THE CITADEL.

ENGRAVED BY K. C. ATWOOD.

mowers, wearing the long white cotton tunics of the region, and swinging their scythes in unison, quite as described by Tolstoi in the famous mowing chapter of "Anna Karenina." Indeed, I did not happen to see a single mowing-machine at work. But I am assured that mowing- and reaping-machines are largely used in some parts of the country, and that their use is steadily increasing.

As all the railroads center in Budapest, every effort to develop Hungarian agriculture benefits the commercial capital. The grain shipments, however, are chiefly by water,—on the Danube and its tributaries,—a great fleet of roofed grain-barges plying on these waterways between Budapest and the wheat-fields. Some of these barges, which are of a construction peculiar to the Danube, have a capacity of six hundred tons of grain. The Government has exerted itself to improve navigation, and great

so-called "middlings purifier" and gradual-reduction system, and the next in importance the substitution of steel rollers of various sizes and patterns for the old-time millstones. These inventions have resulted in giving the industry of flour-making to large mills, thus annihilating small mills by tens of thousands. The new ideas were quickly borrowed by Minnesota millers, and by them were largely developed and improved; and Minneapolis and Budapest have grown contemporaneously as the two great milling centers of the world. Minneapolis leads considerably in the collective capacity of its mills and in the annual product; but it has a much larger field in which to operate, and possesses facilities which Budapest lacks. The mills of the Hungarian capital are, however, a series of magnificent establishments, fitted up with automatic machinery invented and manufactured in the city, provided with

electric lights, and well supplied with ingenious contrivances to prevent fire. Their finest grades of flour are sent to all parts of the world except the United States, and command the highest prices. They like to tell in Pest of certain mysterious individuals who came to town, found employment in the mills, remained long enough to learn all that could be learned, and then disappeared, only to turn up in the sequel as rich American millers. The industry seems not yet to have reached its maximum at Budapest, two or three new mills having been built within a few years; but the profits of the companies have suffered much from American competition, and from the recent high tariffs of Germany and France. Both the flour-product and the general commercial movement of Budapest have at least doubled within fifteen years.

Although it is to see new things rather than old that one visits Budapest, it may be well to say that the town once possessed a Roman fortress and colony, and that its commanding site has involved it in military operations from time immemorial. It is only two hundred years since the Turks were driven out of Hungary, after an occupation of a century and a half, and it was here that our own gallant Captain John Smith won renown and honors from the Christian princes of the land before his career in America began. John Smith's exploits against the Turks in Hungary are worthy the ingenious research of that hero's admirers; but it is of Budapest that I write. The fortress and rugged promontory are upon the right, or south, bank of the Danube, and pertain to Buda. Pest lies upon the flat north bank, and beyond it stretches the illimitable plain. In the old times Buda was the large town, while Pest was only an insignificant village; but all the modern conditions of growth have favored the Pest side, which is now four times as populous as the other. The Buda, or Ofen (Ofen is the German name for Buda), bank is, however, picturesque in the highest degree. The Blocksberg promontory rises abruptly, a sheer mass of rugged rock, nearly a thousand feet above the grand stream

that washes its base; and it is crowned with a now useless citadel. Some day a classic pantheon in honor of Hungary's long list of great men is to be erected on this commanding acropolis. Adjoining the Blocksberg, but not so high, and rising less steeply from the river's brink, is the fortress hill, upon which stands a vast royal palace. Its cheerful buff-colored paint and long rows of green window-blinds suggest a summer-resort hotel; but it is really a very imposing structure, and its situation could hardly be more commanding. About it, on hillsides and in valleys, lies the town once called Buda. On the retreating slopes of the Blocksberg, and upon the sides of the higher mountains that lie in the rear, are many pleasant villas. Buda and its neighboring hills have been famous for their vineyards and their wines, but now the phylloxera has come as a bitter calamity. From the Blocksberg or any other of the neighboring heights, the view up and down the Danube, and over the stately city of Pest on the opposite bank, is enchanting.

It would, of course, be erroneous to say that

SERVITEN PLATZ.

THE ROYAL PALACE.

all the progress, all the improvements, and all the good buildings of Budapest date from the new Hungarian constitution of 1868, or from the consolidation of Buda and Pest which followed that political event, and which was consummated in 1873. Between 1848 and 1868 not a little progress had been made. The Arch-duke Joseph had done much for the sister towns. Population had increased materially; the magnificent suspension-bridge had been

built; the patriotic Count Stephan Széchenyi had founded the National Academy to foster the Magyar speech and literature, and had built for it a fitting Renaissance palace at this time, when the Germans were "in the saddle" and when even the University of Budapest was a German institution with German professors in its chairs. Although, with Russian aid, the Austrians had crushed the Hungarian movement of 1848, so that the people's leaders had to

choose between exile and the halter, and although for some years the whole Hungarian nation was made to feel the heavy weight of the Austrian yoke, it is nevertheless true that the awakening of that year of revolutions resulted in a progress which left many marks in two decades. But after this is said it remains true that nearly all the systematic, appreciable advances of Hungary have been made in the two decades that have followed the happier

governments. As was proper alike from esthetic, sanitary, and commercial considerations, the river was made the center of improvements, and was constituted the prime thoroughfare, the chief open space and place of resort, and, in short, the unrivaled attraction of the city. It became to Budapest what the Grand Canal is to Venice—something more essential than the Seine to Paris or the Thames to London. Magnificent stone quays and retaining-walls were

ALONG THE RIVER.

events of 1868. In Budapest deliberate projects were adopted for the beautifying and development of the city as a fit capital for an ambitious young state. The exiles of 1848 came back with wisdom and experience to take the helm. Count Andrassy, who had been sentenced to be hung, now became prime minister. The reaction was most energetic. For the time being all things German were at a heavy discount. The German officials were hustled out to a man. The University was reorganized on a Hungarian basis, and the whole corps of German professors was unceremoniously dismissed.

Such being the national mood, it is easy to understand that the moment was propitious for large plans. Vienna was carrying out its *stadts-erweiterung* projects in the most magnificent way; and while Budapest could hardly hope to become a Vienna, there was a unanimous determination to modernize and improve the place to the highest possible degree. The ministry and the municipal authorities cooperated, and building operations were intrusted to a mixed commission of the national and city

built, extending for nearly three miles on the Pest side and also for a long distance on the opposite shore. These were thrown well out, the broad channel being thus compressed somewhat to secure a clean, sweeping current. Up and down along the broad promenades facing the water have been erected palatial buildings. The quays are high, and stairs, built continuously for a long distance, lead down to the lower level of the landings, upon which the heavy traffic is confined. The rows of buildings are broken at intervals by open park spaces, in which are effectively placed the statues of various Hungarian notabilities. A number of handsome public buildings are included in the row upon the quays of the left bank, and toward the upper end of the row has been built the magnificent new Parliament house. Further down are the National Academy, the city's so-called "Redout building," the old Rath-haus (city hall), the vast new Custom-house, and various other establishments. For the distance of perhaps a quarter of a mile below the suspension-bridge the quay is a shady promenade, a chair-lined *corso* upon which all driving is prohibited,

and where on summer evenings many hundreds of fashionable people congregate, patronizing the cafés and restaurants, the tables of which are set under the trees in the open air. The Hungarians are even more fond of out-of-door eating and drinking than the Viennese; and Budapest is a city of magnificent cafés.

But, to proceed with a description of the improvement plan, the inner and ancient Pest, known as "the city," and lying upon the river-bank, has been surrounded by boulevards in the form of a polygonal "ringstrasse"; while by demolitions and reconstructions the interior tangle of narrow streets has been brought into something like a modern system. From the sides and angles of the inner ringstrasse broad radial boulevards have been thrown out in straight, or measurably straight, lines to the outer edges of the metropolis, and the lands lying between these great spokes are divided by street systems almost as regular and rectangular as those of American cities. Handsome as is the broad inner ring of boulevards, lined with fine buildings, it is far surpassed by the newer "grosse-ring," which crosses the radials about a mile further out, and which

THE FORTRESS.

describes an arc that, from the new Margaret Bridge to the point where it again meets the river, is four or five miles long. It is very broad and finely paved, and is already lined for the greater part of its course with massive, pretentious structures, while building operations are now busily closing the gaps all along the line. Still other ring boulevards in a concentric series are to be constructed in the future.

The finest single street in Budapest, the gem of the improvement works and the pride of the citizens, is the Andrassy-strasse, a broad boulevard connecting the inner city with the "Stadtvaldchen." The Andrassy-strasse is perfectly straight, and two miles long. It was planned with consummate art, and is one of the most beautiful and effective streets in Europe. Some enthusiastic people pronounce it

LANDING-PLACE.

without exception the handsomest of European streets, and certainly it tempts one to use superlative language. It is divided into three parts by the "Octagon-platz," where it crosses the larger ringstrasse, and by the "Rond-platz," or "circus," at a point where another encircling boulevard is eventually to cross. As it emerges from the Octagon-platz and the Rond-platz the street grows successively wider, although this would hardly be noticed by the casual passer. The first third of the distance is devoted to fine buildings, of varied architecture but general conformity, built solidly on the street line. The next third contains houses

that the Buda side has also its boulevard system, and that the cost of expropriations and of construction in this remodeling of the street system has aggregated a large sum.

The Stadtwaldchen is a beautiful park of about a thousand acres, which plays a most intimate part in the life of the Budapest people. Fortunately it is not remote or difficult of access, and is to Budapest what the "Prater" is to Vienna. It contains a charming lake for skating in winter and for pleasure-boats in summer. It has its areas of deep and quiet shade, its zoölogical corner, and, above all, its collection of cafés, refreshment-stands, shooting-

MORNING COFFEE.

ENGRAVED BY A. NEGRI.

having narrow fore-gardens of a prescribed width. The last third—a distance of two thirds of a mile—is devoted to separate villa-like residences, all at equal distance from the sidewalks, and, with infinite variety of architectural detail, conforming to the regular street plan. The vista from the entrance of this street to its end in the shady Stadtwaldchen is very beautiful. The broad central driveway is paved with wooden blocks on a solid concrete foundation. The sidewalks are of asphalt, the narrower driveways next the sidewalks are paved with square-cut stone blocks, and the equestrian courses, which are between the central and the outer driveways, are graveled. Although there are no individual buildings on the Andrassy-strasse which cannot readily be matched in any other important city, the average of architectural merit is very high; and the absence of anything that can mar the general effect is an important element in the success of this public improvement. It should be said

galleries, "roller-coasters," arenas, Punch and Judy shows, summer theaters, wax-work exhibitions, and "side-shows" in bewildering variety, all very cheap, all very good of their respective sorts, and all very delightful to the pleasure-loving thousands who resort to the park in the spring and summer afternoons. Here is located also one of the municipal government's hot sulphur-water bathing establishments. Of small parks and open spaces the city has a number, though not so many as should have been reserved. The Elisabeth Park is especially worthy of mention.

Certainly it would be unpardonable to omit mention of the "Margareta Island." The "Margareten-Insel" lies in the Danube at the upper end of the city. In ancient days it belonged to an order of nuns, the ruins of whose convent still remain. In the fifteenth century the Turks drove the poor nuns away, and the janizary pashas established their harems there. On the expulsion of the Turks the island became city

property, but a generation ago it was given by the municipality to the Archduke Joseph for a hunting-ground. The present archduke keeps it in beautiful order as a pleasure-ground for the public. It is nearly two miles long and about half a mile wide, and it deserves the enthusiasm with which the Budapest people regard it. It is full of a variety of magnificent trees, has tasteful flower-gardens, is also the seat of mineral baths elaborately appointed, with two or three adjoining hotels, and has the restaurants without which no pleasure-ground would be complete in southern Europe. Among the hills of the Buda side, also, are parks and

taxpayers. In the making of this list men of liberal education are rated for double the taxes they actually pay, in order that brains and learning may have recognition. A standing committee makes out a list of the aristocratic 200, and it so happens that the great voting public always elects the entire list thus selected. The whole council retires *en masse* at the end of each six years' term. The body is of course much too large for efficiency. Possibly a hundred will be found at one ordinary meeting, and at the next meeting a hundred again, but quite a different hundred. The committees also are much too large to be workable, some of them

DINING OUT OF DOORS.

ENGRAVED BY J. W. EVANS.

pleasure-grounds; and the population is blessed with much beautiful weather and a great number of holidays in which to enjoy its open-air advantages.

Budapest has a municipal council that is as large as a "town-meeting." If any other city in the world has a council of 400 members, I have not yet learned the fact. Pest began in 1868 with 200 members; but when the consolidation was effected in 1873 the plan of adding 200 members chosen from the higher ranks was adopted. It was provided that the whole body of electors, besides choosing 200 common members in the nine wards, should choose 200 more from a list of the 1200 largest

having thirty or forty members. The actual executive work is performed by a magistracy composed of a burgomaster, two vice-burgomasters, and ten other so-called magistrates, all chosen by the council for terms of six years. Each magistrate has his special administrative department. These and several other high executive officials are *ex officio* members of the council. Two officials, the Director of Archives, and the Director of the Municipal Bureau of Statistics, are appointed for life. The advisability of reducing the membership of the council is generally recognized, and when the opportune moment for a revision of the municipal constitution comes, it is quite certain that the aristo-

cratic 200 will be cut off at the first stroke. But the inefficiency of the present unwieldy council is counterbalanced by the efficiency of the smaller magisterial and executive corps, so that Budapest cannot by any means be called a badly governed city.

The social aspects of municipal administration have a growing interest and importance, and Budapest's experience and undertakings are worth relating. Twenty years ago the average annual death-rate was 45 per 1000 inhabitants, and in epidemic years it reached 50. The average rate is now 29, and this remarkable reduction has been effected in the face of the rapid growth of the city's population. It means the saving of at least 8000 lives a year. The rate is still a high one when compared with western Europe or America; but it is to be remembered that Budapest is the capital of a country that borders on the Turkish empire. The death-rate in all Eastern countries is vastly higher than in Western countries. Thus in Russia, and in the Danubian and Balkan states, the rate is still higher than in Hungary. That Budapest, the crowded city, has managed to bring its death-rate to a point below that of the country as a whole is a most exceptional and noteworthy fact. It is believed that within a few years the average rate for the city can be reduced to 25. How has this gratifying improvement of the general health been effected? By a series of municipal measures not yet fully completed. The first of these measures was an improved water-supply. The Danube water was pumped into reservoirs and filtered by the natural process through sand, with good results. The town has grown so fast that the water question has again become a pressing one, some quarters being obliged to accept an unfiltered supply. It has been determined to provide a new and permanent system.

As the sequel has proved, one of the most fortunate features of the municipal system be-

ENGRAVED BY J. A. NAYLOR.

THE ANDRÁSSY-STRASSE.

gun twenty years ago was the establishment of a bureau of statistics. Mr. Joseph Körösi was made statistician for life, and after twenty years of service he is still young and enthusiastic. His reports, monographs, brochures, and special investigations, pertaining to every conceivable municipal question capable of statistical treatment, are without a parallel in the world for their complete, exhaustive, and timely character; and the social and sanitary reforms of Budapest have followed the lines laid down by the statistical bureau. Until Mr. Körösi's work began, the high mortality of Budapest was not known. Its citizens thought it an extremely healthy place. The statistical office was denounced as slandering and injuring the city when it discovered and published the facts. But Mr. Körösi persevered, and his re-

markable census of 1871 attempted to account for the high mortality. He made a thorough study of the conditions of the population, and found overcrowding very prevalent, and, worst of all, a very large element of the population in damp underground residences. There followed a series of regulations to prevent these evils. Underground tenements were forbidden, and new quarters for the poor were constructed. But the badly housed population was too large to be shifted at once, and it became necessary to permit the reoccupancy of the drier and less objectionable subground domiciles. It is estimated that to this day nearly 10 per cent. of the population live below the street level; but on the whole there has been great improvement in the housing of the poor, through careful sanitary rules and a system of inspection. And these measures have favorably affected the death-rate.

The food-supply has also been brought under suitable public control. The great municipal slaughter-house is one of the establishments in which the citizens take especial pride. It is very imposing architecturally, is finely appointed, and, as a public monopoly, is made to contribute to the municipal coffers while serving a sanitary end. Connected with it are

the public cattle-markets, which well repay a visit on the weekly market-day for their splendid herds of the long-horned white oxen of Hungary and Servia. The produce-markets of Budapest, as of all other towns of southeastern Europe, are attended by great numbers of peasants in national costume, and are as picturesque as any scenes in the Orient.

To continue with the new social establishments of the municipality, some mention must be made of the magnificent general hospital, built with separate brick pavilions, according to the most approved plans, and occupying spacious and beautiful grounds. In a wooded area on the edge of the city, sufficiently isolated without being inconveniently remote, has been built the new municipal hospital for epidemic diseases, which is to conform to all the latest requirements of sanitary science. Budapest is at length bringing infectious diseases under control. The so-called "prophylactic" measures of obligatory reports by physicians, of prompt isolation of every case, of visits and instruction by the authorities to insure proper care and treatment, of control of the children of families in which are cases of such disease, and, finally, of disinfection by the public authorities, are employed with success. Attention has been given to street and domestic scavenging. The sewer system, though not complete and perfect, is greatly improved. The Danube is so large a stream that it suffices to carry off all the refuse of the city, and no separation or "treatment" of sewage is necessary.

Another important health-measure has been the establishment of free baths in the Danube, for summer use, — these institutions being well patronized, — and also the utilization by the authorities, for the benefit of the poor, of some of the hot sulphur springs, the curative properties of which in certain diseases are very famous. As a result of the various efforts to improve the health and social condition of the people, put forth intelligently and humanely by the public authorities, Budapest is fast exchanging its Oriental unwholesomeness for the comparative healthfulness of an Occidental city. Meanwhile Mr. Körösi's elaborate statistical analyses throw light from time to time upon every doubtful point, and his unequalled library of inter-municipal statistics enables him to present his constituency with stimulating comparative data.

An American expects to find real-

THE OPERA-HOUSE.

MUSIC IN A PUBLIC GARDEN.

estate speculation rife in a city growing so rapidly as Budapest; but there seems to be practically none. This state of affairs is due, at least in large part, to the fact that much of the vacant land in and about the town belongs to the municipality, having been public property for a long time. As the growth of the town requires, the authorities from time to time sell building sites to the highest bidders. The modern school of land-reformers would condemn this alienation, and would insist that the fractions of the social domain should be leased rather than sold; but the southeastern European is a firm believer in private land-holding, and loves to possess his own house and bit of garden. The municipal corporation of Budapest is fortunate in possessing all the ground that it needs for hospitals and public objects. This remark, however, does not apply to the Buda side of the river, the old town of Buda having at an early day parted with all its landed possessions.

The illumination of Budapest is a monopoly in the hands of a private gas company whose original charter expired in 1881, and whose renewed charter will terminate in 1895. The city obtains gas for street purposes at reduced rates; it obliges the company to mitigate its charge to consumers in accordance with a sliding scale based upon the increase in aggregate consumption; and moreover it collects very heavy taxes from the company. It has the

right to take over the plant and business at an appraised valuation, but it is awaiting the development of electric lighting; and there is a strong probability that in 1895 the municipality will enter upon the business of manufacturing and selling the new illuminant.

Street transportation has also been kept under control by the municipality. A united tramway system pays street rentals and large taxes. The company's fares are fixed by law, and it is required that working-people shall be carried at reduced rates in the morning and evening. Five or six years ago a rival company was allowed to introduce electric street-railways, and the experiment has been so successful that the trackage is being greatly increased. Similar lines and narrow-gauge roads to the neighboring villages have been constructed, and for present purposes the local transportation system is quite adequate and satisfactory. At the expiration of existing charters, the street-railway lines and their equipment will become the property of the city, without indemnity to the private owners.

The educational, literary, and artistic progress of Budapest has been as striking in the last two decades as its material progress. The educational system has been reformed and revived from the bottom to the top. At the very apex is the University, under national auspices and support, an institution fairly com-

IN THE MARKET.

parable with the better universities of Germany. It suffered somewhat, twenty years ago, by the precipitate expulsion of the German faculty and the too sudden transformation from a German to a Hungarian basis. But it has recovered, and now has a truly national character and influence. Another important official educational establishment, the Royal Polytechnic Institute, with important technical courses in engineering and applied science, flourishes at Budapest. Then comes a series of collegiate establishments, *gymnasien* and *real-schulen*, some of which are national and municipal, while others are denominational with public subventions. Below these are the advanced schools for boys and girls, corresponding in their work to our upper grammar- and lower high-school grades, and having

certain industrial and practical features. On the same level are certain mercantile and trade schools. And then come the numerous elementary schools, the accommodations of which are intended to be equal to the requirements of the Compulsory Education Act; for throughout Austria and Hungary elementary education has for a number of years been obligatory upon all. The children learn perfectly both the Hungarian and the German languages, and not infrequently they learn something of either French or English.

The Hungarians, like all the people of southeastern Europe, are ready linguists. But the ease with which they acquire other languages does not diminish their devotion to their own. The Hungarian, or Magyar, speech has no affinity with the other languages of the Austro-Hungarian empire. It is more closely related to the Turkish than to any other tongue. It is a concise language, flexible, musical, and has a rich vocabulary; and its most enthusiastic defenders are men who cannot be charged with ignorance of the capabilities of the three leading languages of western Europe. An extensive and growing Magyar literature exists, and the book-shops of Budapest teem with new productions in all fields of thought. The press of Budapest is also very active. Indeed, the Hungarians claim that nowhere else in Europe is journalism so free, and so influential in molding opinion and guiding affairs. An extraordinary number of the leading men in Parliament are or have been journalists. A Budapest writer has lately remarked that "all the men who can be regarded as distinguished and important in the field of Hungarian politics stand in close relation to the press: Louis Kossuth was a journalist; Francis Deák entered upon his work of adjusting Hungarian and Austrian relations

THE NATIONAL MUSEUM.

with a series of newspaper articles; and in the list of journalist statesmen stand the names of the brilliant Anton Csengery, Baron Sigismund Kemény, Moritz Jókai, Max Falk, Louis Csernátony; in a word, the most important of the public men of Hungary are journalists, for even the Prime Minister Tisza himself, in his time, when leader of the opposition, cultivated public opinion through the columns of a Hungarian journal." In Budapest alone there are now more than 230 different periodicals published in the Hungarian language, while there are at least 40 in the German tongue. And there are a dozen important daily papers.

The Hungarian people have musical and artistic talents of the highest order, and their gifted sons are constantly seeking and winning the rewards that the larger European capitals have to offer. The painters and sculptors of Budapest go to Paris. The musicians are to be found everywhere. The most distinguished violin virtuosos and professors of Europe, from Joachim of Berlin down to men of lesser note, are nearly all Hungarians. One of the ornaments of the *Andrássy-strasse* is the Conservatory of Music, where Liszt was formerly the presiding genius. The high honors of the Paris Exposition were awarded to a Hungarian painter, Munkacsy. The musical and artistic activity of Budapest is very considerable, and it also has received great impetus from the causes which have led to the recent expansion of all interests in the Magyar capital. The Government maintains a National Theater that has played an important part in the patriotic and intellectual life of the people, encouraging poetic and literary activity, and upholding the national speech. Even more successful, if possible, in these respects is the Volks Theater, which, supported by the municipal government and conducted upon the most popular plan, fills a prominent place in the life of the community. The most imposing structure devoted to musical and dramatic art is the new Royal Opera, supported by the Government, in the *Andrássy-strasse*. It is one of the two or three finest opera-houses in Europe, in its magnificence hardly coming short of those in Vienna and Paris. The large German element, and indeed the whole community,—for everybody understands the German language,—is kept in touch with the musical and dramatic art of the German empire and of Austria through the *Deutsch Theater*, a splendid and thoroughly popular house, managed with rare tact and judgment. It is not necessary to mention any of the minor theatrical institutions. The four great ones already named would redound to the credit of any city.

If Budapest were possessed of no other attractions whatsoever, its remarkable hot springs and mineral waters, unequalled for the variety

of their curative properties by any other group of medicinal springs in the entire world, should give the place great fame. Its warm spring baths are very ancient. The Romans utilized them, and they called Buda "Aquincum" (Five-waters), with reference to the five springs that were known and used. The Huns also prized the healing waters; and finally the Turks, during their period of domination, built great public baths, and regarded the waters as possessed of the highest virtue. Some of these baths now belong to the municipality and some are private property. For the most part they lie on the Buda side of the river. Especially noted are the "Kaiser-bad," the "Lukas-bad," and the "Königs-bad," belonging to the Josephsberg group, and lying at the base of that conspicuous eminence. To the same group belong the baths of the Margareta Island. Comfortable hotels adjoin these springs, and the bathing-establishments for the most part are commodious and even luxurious. A more beautiful health-resort than the "Margareten-Insel" can be found nowhere. Another group includes the "Raitzen-bad," the "Bruck-bad," and the "Blocks-bad," lying a little distance further down the river and in the vicinity of the Blocksberg promontory. On the other side of the city, in the *Stadtwaldchen Park*, the municipal authorities have a hot sulphur-bath establishment, supplied with water by an artesian well nearly three thousand feet deep. The saline constituents of these various sources are different, and some of the springs are recommended for one class of diseases, and some for another. The waters are used either externally, internally, or both, according to the case to be treated. There are in use some interesting old remains of Turkish bath-house architecture, notably one belonging to the municipality, the "Rudas-bad." The modern buildings are not magnificent, but they are handsome and comfortable.

Just out of Buda, in a little plain surrounded by high hills, are the well-known "bitter-water" springs which have made the name of Hungary more famous perhaps than any other article of export. These curative mineral waters are bottled in vast quantities and sent to all parts of the world. The "Hunyadi" water, the "Franz-Josef," the "Königs-bitter-wasser," and the "Rákóczy," are the best-known of these potent Budapest waters. It would be superfluous to discuss here their remedial qualities. But the baths, springs, and wells I have named, with various others in the immediate vicinity, constitute a marvelous endowment bestowed by nature upon this beautiful city, and beyond all doubt will be a source of very great wealth and fame in the future. As at Bath in England, these healing waters of Budapest may

become at some time a property yielding a direct and large municipal revenue.

Enough has been said, perhaps, to show that Budapest has become in recent years one of the best-appointed of modern cities. Its streets are handsome and clean, asphalt being the prevailing material; its drainage is good; its health-system is producing beneficent results; its water-supply is about to be enlarged and perfected; its local transportation system is fairly adequate; its building regulations are producing a well-constructed and handsome city; and its provisions for education and recreation are highly creditable. Its public buildings are of good architecture and of considerable variety. A splendid new building is about to be erected for the housing of the municipal government, the offices now being distributed among several city buildings. One of these, the famous "Redout building," is an imposing structure containing a vast public hall for balls and entertainments, the ground floor being used as a fashionable restaurant and café. Of "private-public" buildings, as hospitals, schools, academies of art or science, hotels, and the like, the city has a most creditable supply. One of the conspicuous objects on the quay in the lower part of Pest is a large grain-elevator, built of brick in a most ornamental style of architecture, and owned and operated by the municipal government with the idea of promoting the grain trade and also of introducing, by example, this modern American institution. It is perhaps the only grain-elevator in Hungary. It is a needlessly costly building, but it has proved itself a valuable adjunct to the trade of the town, and within a few years, undoubtedly, private enterprise will multiply the number of these establishments.

The prospects for Budapest's continued growth as a Danubian metropolis are very bright. As the center of the Hungarian state-railway system, its commercial importance is constantly enhanced by the development of the resources of the country and the corresponding increase of traffic. And it is no longer doubtful that the capital will be the gainer to an enormous extent by the new "zone tariff" put in operation on the state-railway system in August, 1889.<sup>1</sup> This remarkable innovation in railroading entirely changes the passenger-ticket system. From Budapest as a center 14 zones are described, the first having a radius of 25 kilometers. The second is a belt lying between the inner circle and an outer one drawn with a 40 kilometer radius; *i. e.*, its width is 15 kilometers. Successive zones have a radius from the Budapest center of 70, 85, 100, 115, 130, 145, 160, 175, 200, and 225 kilometers, while to the fourteenth

zone are assigned all distances on any of the Hungarian state lines that lie more than 225 kilometers away from the capital. For any point in each of these zones the fare is the same. The new rates are greatly reduced, being in some cases one half and in other cases less than one fourth the former rates. The average reduction is not far from two thirds. Railway bookkeeping is of course simplified by the new system, and traveling has received an unwonted stimulus. It is now conceded that the innovation is a success from the point of view of railway financiering; and it is even more brilliant a success from the point of view of the commercial and social progress of the capital city. It has given new movement and life to the sluggish population of the outlying parts of Hungary. Thus in 1880 the entire number of persons carried by the principal transportation companies of the whole country was only 2,000,000; and in 1885, the year of Budapest's exposition, the number aggregated only about 2,800,000. But in 1889, as a result of five months of the zone tariff, the number reached nearly 5,500,000, while in 1890 it was about 6,850,000, and was considerably greater still in 1891. Taking the Hungarian state railways alone, for the three years 1888, 1889, and 1890, we find passenger traffic amounting respectively to 841,462, 1,944,588, and 2,936,771. The Austro-Hungarian system of roads was obliged to meet the new rates and methods, and its Hungarian lines, which in the half-decade preceding 1889 had carried 900,000 people per annum, are now carrying some 2,000,000 yearly. To show more clearly the local effect upon the movement of travel to and from Budapest, it may be stated that at the central station of the Hungarian state-railway system the arrivals and departures were 743,000 in 1888 and 2,740,000 in 1890, the change having been wrought altogether by the cheapened rates and the general convenience of the zone system. At the station of the Austro-Hungarian lines also the movement has fully doubled in consequence of the new policy. Great results in like manner are following the more recent adoption of zone tariffs and reduced rates for freight traffic.

Thus the Danube valley has at length begun to show development under the magic of modern industrial forces; and its progress within the coming half-century bids fair to exceed that of some newer regions of the Western world. Budapest promises to wrest from Vienna the commercial ascendancy of the lower Danube valley, and it is possible that there may be in store for it a very brilliant political future as the capital of a Danubian confederation that shall include Hungary and the smaller states of the Southeast. That this is the ambition of many

<sup>1</sup> See "Topics of the Time" for December, 1890.

Hungarians is perfectly well known; and Hungary is preparing to play an unprecedentedly important rôle in the political life of Europe. But whatever may be the political future of the Austro-Hungarian empire and of the Balkan peninsula, it is now certain enough that Budapest is to take and hold its place among the great cities of the civilized world.

EVENING.

## COMATAS.

And he shall sing how, once upon a time, the great chest prisoned the living goatherd by his lord's infatuate and evil will, and how the blunt-faced bees, as they came up from the meadow to the fragrant cedar-chest, fed him with food of tender flowers because the Muse still dropped sweet nectar on his lips.—THEOCRITUS.

L YING in thy cedarn chest,  
Didst thou think thy singing done,  
Comatas? And thyself unblest,  
Prisoned there from sun to sun?

Through the fields thy blunt-faced bees  
Sought thy flowers far and away,  
And gathered honey from thy trees—  
Thou a prisoner night and day.

Heavy with their honeyed store,  
Seeking west and seeking east  
Thee whose absence they deplore,  
Late they found and brought their feast.

Grief no more shall still thy song,  
Loss, privations, fortunes dire!  
Servants of air about thee throng,  
And touch thy singing lips with fire.

Love, art thou discomfited  
In thy narrow lot to lie?  
See how divinely thou art fed  
By the creatures of the sky!

*Annie Fields.*

# THE NATURE AND ELEMENTS OF POETRY.

## IV. MELANCHOLIA.

WE have considered ancient poetry, the Hebrew and the classic, from which we so largely derive, finding even in that of the Augustan prime a marked departure from the originaive temper of the earlier literatures. Centuries afterward, in Persia, the "Shah Nameh," or Book of Kings, furnished a striking instance of heroic composition: the work of a royal genius—Firdusi, whose name, signifying Paradise, was given him by the great Mahmoud because he had made that Caliph's court as resplendent as Eden through his epic of "Rustem and Sohrab," his song of "the rise, combats, death" <sup>1</sup> of the Parsee religion and nationality. To produce an epic deliberately that would simulate the primitive mold and manner, in spite of a subjective, almost modern, spirit, seems to have been the privilege of an Oriental, and, from our point of view, half-barbaric, race.

The strength of the Homeric poems and of the sagas of the North betrays the gladness out of which they sprang, the joy that a man-child is born into the world. They were men-children indeed. Compared with our own recitals—with even Tasso's "Jerusalem," Ariosto's "Orlando," or the "Lusiad" of Camoëns—their voice is that of the ocean heard before the sighing of reeds along a river's brim. Nevertheless, we must note that of the few great world-poems the subjective element claims its almost equal share.

As we leave the classic garden there stands one mighty figure with the archangelic flaming sword. After Dante it may be said that "the world is all before" us "where to choose." Behind him, strive as we may with renaissance and imitation, we need not and cannot return. Heine says that "every epoch is a sphinx which plunges into the abyss as soon as its problem is solved." After a thousand years of the fermentation caused by the pouring in of Christianity upon the lees of paganism, a cycle ended; the shade of Dante arose, and brooded above the deep. From his time there was light again.

<sup>1</sup> Gosse's Introduction to Miss Zimmern's "Stories Retold from Firdusi."

A climacteric epoch had expired in giving him birth. His own age became Dante, as if by one of the metamorphoses in the "Inferno." And the "Divine Comedy" is equally one with its creator. The age, the poem, the poet, alike are Dante; his epic is a trinity in spirit as in form. Its passion is the incremental heat that serves to weld antique and modern conceptions, the old dispensation and the new.

It is said that great poets are always before or behind their ages; Dante was no exception, yet he preëminently lived within his time. Above all else, his epic declares the intense personality that must have voice; not merely expression of the emotion that inspired his minor numbers—themselves enough for fame—addressed to Beatrice, but also of his insight concerning the master forces of human life and faith and the historic turmoil of his era. It was composed when he had matured through knowledge and experience to that ethical comprehension which is the sustaining energy of Job, of the Greek dramatists, of Shakspeare, Milton, and Goethe. Then he cast his spirit, as one takes a mold of the body, in the matrix of the "Divina Commedia." In this self-perpetuation he interpreted his own time as no modern genius can hope to do—and this is the achievement of personality at its highest. That he might succeed, he was disciplined by controversy, war, grief, exile, until the scales fell from his eyes, and he saw, within the glory of his Church's exaltation, the vice, tyranny, superstition, of that Church at that time, of his people, of his native state. His heart was strengthened for judgment, his manhood for hate, and his vision was set heavenward for an ideal. His epic, then, while dramatically creative, is at the apex of subjective poetry, doubly so from its expression of both the man and the time; hence our chief example of the mixed type—that which is compounded of egoism and inventive imagination. Its throes are those of a transition from absolute art to the sympathetic method of the new day.

Dante could effect this only by a symbolism combining the supreme emblems of pagan and Christian schools.

In his allegory of Hell, Purgatory, and, above all, of Paradise, he is the most profound and aspiring of ethical teachers. The feebler handling of symbolism, for art's sake and beauty's, and with an affectation of the virtues, is seen in

the "Faërie Queene" of our courtly Spenser, the poet's poet, yet one who never reached the mountain-top of absolute ethics. The tinker Bunyan's similitudes—and he was essentially a poet, writing in English beyond a mere scholar's mastery—are more intrinsically dramatic. But they illustrate a rigid creed, and are below the imagery that sets forth equally human crime and nobleness, the vision that illumines life, churchcraft, statecraft, nationality, art, and religion. Within the eternal blazon of that saturnine bard whose

Rugged face

Betrays no spirit of repose,

The sullen warrior sole we trace,

The marble man of many woes.

Such was his mien when first arose

The thought of that strange tale divine,

When hell he peopled with his foes,

Dread scourge of many a guilty line.

War to the last he waged with all

The tyrant canker-worms of Earth;

Baron and duke, in hold and hall,

Cursed the dark hour that gave him birth;

He used Rome's harlot for his mirth;

Plucked bare hypocrisy and crime;

But valiant souls of knightly worth

Transmitted to the rolls of Time.

THE antique charm, meanwhile, had fled to England, ever attaching itself to the youth of poesy in each new land. The English spring-time!—to be young in it is very heaven, since it is the fairest of all such seasons in all climes. It gladdens the meadows and purling streams of Dan Chaucer's Tales and Romaunts, and in their minstrelsy he forgot himself, like a child that roams afield in May. With Spenser, and the Tudor sonneteers, the self-expressive poetry of England fairly begins. They, and their common antique and Italian models, were the teachers of Milton in his youth. The scholar gave us what is still in the front rank of our English masterpieces and, with one exception, the latest of those rhythmical creations which belong to the world at large.

Milton in his epic appears less determinedly as the rhapsodist in person than Dante in the "Divine Comedy." He sees his vision by invocation of the Muse, while the Florentine is "personally conducted," one may say, on his tour through the three phantasmal abodes. Doubtless "Paradise Lost" is the more objective work; but with the unparalleled Miltonic utterance, its author's polemic creeds of liberty and religion are conveyed throughout. He also stands foremost among the bards of qualified vision, by virtue of "Samson Agonistes," a classical drama in which he himself indubitably towers as the blind and fettered protagonist.

Milton's early verse is the flower of his passion for beauty and learning, and exquisite beyond

that of any young English poet then or now—his pupil Keats excepted. Had he died after "Il Penseroso," "L'Allegro," and "Lycidas," he would have been mourned like Keats; for their perfection is to-day the model (though usually at second hand) of artists in English verse. In "Lycidas" he freed our rhythm from its first enslavement: its second lasted from Pope's time until the Georgian revival. One mark of the subjectivity of his early poems often has been noted—they are none too realistic in their transcripts of nature. Milton, as in his greater work, looked inward, and drew his landscape from the Arcadian vistas thus beheld. Besides, he was such a master of the Greek, Latin, and Italian literatures as to be native to their idioms and spirit. His more resolute self-assertion came in argument and song after experience of imposing national events and sore private calamities, when the man was ripe in thought, faith, suffering, and all that makes for character and exaltation. The universe, as he conceived it, was his theme. His hero, the majestic Satan of his own creation, outvies the Æschylean demigod. The Puritan bard, like Dante, idealized an era and a religion. In the matter and style of the sublimest epic of Christendom its maker's individuality everywhere is felt. The blind seer seems dictating it throughout. We see his head bowed upon his breast; we hear the prophetic voice rehearsing its organ-tones; and thus we should see and hear, even if we could forget that outburst at the opening of the Third Book, wherein, after the radiant conception of the "Eternal coeternal beam," the sonorous declaration of his purposed higher flight, and the pathetic references to his blindness, his final invocation enables all after-time to recognize the inward light from which his imagination drew its splendor.

So much the rather thou, celestial Light,  
Shine inward, and the mind through all her  
powers

Irradiate, there plant eyes, all mist from thence  
Purge and disperse, that I may see and tell  
Of things invisible to mortal sight.

Milton's eventide sonnets, incomparable for virility and eloquence, are also nobly pathetic; there are no personal strains more full of heroic endurance. Not again was there a minstrel so resolved on personal expression, yet so creative, so full of conviction that often begat didacticism, yet so sensitive to impressions of beauty, until we come to Shelley—and his flight, alas! was ended, while as Arnold says, he was still "beating in the void his luminous wings in vain."

BUT the nineteenth century, complex through its infusion of peoples and literatures, and

with all history behind it, has developed the typical poetry of self-expression, and withal a new interpretation of life and landscape through the impressionism of its artists and poets. All this began with the so-called romantic movement.

Kingsley, in his "Hypatia," brings the pagan Goths of the North, fair-haired worshippers of Odin, giants in their barbaric strength, to Christian Alexandria, where they loom above the Greek, the Roman, and the Jew. In time they overran and to some extent blended with the outer world. It is strange how little they affected its art and letters. Not until after the solvent force of Christianity had done its work, could the Northern heart and imagination suffuse the stream of classicism with the warm yet beclouded quality of their own tide. Passion and understanding, as Menzel has declared, represent the antique; the romantic—the word being Latin, the quality German—is all depth and tenderness. To comprehend the modern movement,—vague, emotional, transcendental,—which really began in Germany, read Heine on "The Romantic School," of which he himself, younger than Arnim and Goethe, was a luxuriant offshoot. It came into England with Coleridge, with Leigh Hunt and Keats, and found its extreme in Byron. Later still, it fought a victorious campaign in France, under the young Hugo and his comrades. In fine, with color, warmth, feeling, picturesqueness, the iridescent wave swept over Europe, and to the Western World—affecting our own poetry and fiction since the true rise of American idealism. Upon its German starting-ground the imperial Goethe was enthroned, but he has been almost the only universalist and world-poet of its begetting. For he not only produced with ease the lyrics that made all younger minstrels his votaries, but was fertile in massive and purposely objective work. The drama was his life-study, and he sought to be, like Shakspeare, dramatist and manager in one. "Faust," the master-work of our century, is an epochal creation. Yet even "Faust" is the reflection of Goethe's experience as the self-elected archetype of Man, and is subjective in its ethical intent and individuality. Still, the master's tranquil, almost Jovian, nature enabled him often to separate his personality from his inventions. This more rarely is the case with the only Frenchman comparable to him in scope and dramatic fertility—superior to him in energy of lyrical splendor. Melodramatic power and imagination are the twin genii of Hugo, and his human passion is intense; but his own strenuous, untamed temperament compels us everywhere, even in his romantic and historic plays. He was the true creator of modern French literature, for which he furnished a new vocabulary,

and he brought France out of her frigid classicism into line with the Northern world. Then came Lamartine, with his sentiment, and Musset and Gautier—children of Paris and Helen, consecrate from birth to the abandon of emotion and beauty, and equally with Lamartine to the poetry of self-expression.

Long before, in Scotland, a more spontaneous minstrel also had sung out of the fullness of the music born within him, but with a tone that separated him from the choir of purely subjective poets. Burns was altruistic, because his songs were those of his people. In his notes amid the heather Scotia's lowly, independent children found a voice. It was his own, and it was theirs; he looked out and not in, or, if in, upon himself as the symbol of his kind. Of all our poets, lyric and idyllic, he is most truly nature's darling; his pictures were life, his voice was freedom, his heart was strength and tenderness. Yet Burns,

Who walked in glory and in joy,  
Following his plough, along the mountain-side,

is not a child of the introspective Muse. Relatively late as was his song, he stands glad and brave among the simple, primitive, and therefore universal minstrels.

No; it is in Byron, with his loftier genius and more self-centered emotions, that we find our main example of voice and vision conditioned by the temperament of their possessor. Objective poetry, being native to the youth of a race before self-torturing sophistry has wrought bewilderment, seemingly should appeal to the youth of an individual. And thus it does, but to the youngest youth—that of a wonder-loving child, whom the "Iliad" and "Odyssey," or Scott's epical romances, delight, and who can make little of metrical sentimentalism. The world-weary veteran also finds it a refreshment; his arrogance has been lessened, and he has been taught that his griefs and dreams are but the common lot.

Yet it is plain that subjective poetry, if sensuous and passionate, strongly affects susceptible natures at a certain stage of immaturity. Now that town life is everywhere, we see the Wertherism of former days replaced by a kind of jejune estheticism, with its own peculiar affectation of wit and indifference. But to the secluded youth, not yet concerned with action and civic life, subjective poetry still makes a mysterious appeal. Sixty years ago the young poet of the period, consciously or otherwise, became a Childe Harold, among men "but not of them," one who had "not loved the world, nor the world" him. He found a mild dissipation in contemplating his fancied miseries, and was a tragic personage in his own eyes, and usually a coxcomb in those of the unfeeling

neighborhood. This mock-heroic pose, so often without a compensating gift, was and is due to the novel consciousness of individuality that comes to each and all—to the over-consciousness of it which many sentimentalists, against a thousand slights and failures, retain by arrested development to the end of their days. At its best, we have poetic sensibility intensified by egotism. Keats understood this clearly, even when experiencing it. In spite of the real tragedy of his career, he manfully outgrew it; his poetry swiftly advanced to the robust and creative type, as he wasted under a fatal illness and even in his heart's despair. And what better diagnosis of a young poet's greensickness than these words from the touching preface to "Endymion"?

The imagination of a boy is healthy, and the mature imagination of a man is healthy; but there is a space of life between, in which the soul is in a ferment, the character undecided, the way of life uncertain, the ambition thick-sighted: thence proceed mawkishness, and all the thousand bitters which those men I speak of must necessarily taste in going over the following pages.

It was preordained that even this limbo of life should have an immortal voice, and that voice was Byron. Until his time the sturdy English folk had escaped the need of it. This came with a peculiar agitation of the national sentiment. That Byron found his fame, and the instant power to create an audience for his captivating monodrama, restricted him to a single and almost lifelong mood. This was the more prolonged since it was thoroughly in temper with an eager generation. The French Revolution led to a perception of the insufficiency and brutality of contemporary systems. Rebellion was in the air, and a craving for some escape to political, spiritual, and social freedom. Byron pointed out the paths by land and sea to a proud solitude, to a refuge with nature and art which the blunted public taste had long forgotten, and he sang so eloquently withal that he drew more than a third part of the rising stars of Europe after him. Their leader is the typical bard of self-expression, not only for the superb natural strength, and directness, and passion of a lyrical genius that forces us to bear with its barbaric ignorance of both art and realism, but because he sustained it to the end of his career in a purely romantic atmosphere. This pervades even the kaleidoscopic "Don Juan," the main achievement of his ripest years, strengthened as it is by the vigor of which humor is the surpluse and an easy-going tolerance the disposition. It must always be considered, in so far as his development was arrested, that Byron was a lord, born and bred in the British Philistinism against

which his nature protested, and that the protest was continued because the fortress did not yield to assault. And he had no Byron for a predecessor, as an object-lesson in behalf of naturalness and common sense.

Shelley, who came and went like a spirit, and whose poetry seemed the aureole of a strayed visitor from some translunary sphere, is even more present to us than Byron, with whom, by the law that brings the wandering moths of nightfall together, his life touched closely during its later years. His self-portrayal is as much more beautiful and poetic than Byron's as it is more truthful, unaffected—drawn wholly for self-relief. That it had no theatrical motive is clear from internal evidence, and from his biographer's avowal that he had gained scarcely fifty readers when he died. Byron was consciously a soliloquist on the stage, with the whole reading world to applaud him from the auditorium. Again, while nothing can be more poignantly intense than Shelley's self-delineation in certain stanzas of the "Adonais," and throughout "Alastor," selfishness and egotism had no foothold in his nature. He was altruism incarnate. His personal sufferings were emblematic of wronged and baffled humanity. Thus it was that when removed somewhat from the battle-field, and in the golden Italian clime of beauty and song, his art instinct asserted itself; his poetic faculty at once became more absolute, and he produced "The Cenci," "Prometheus Unbound," and shorter lyrical pieces more than sufficient to prove his greatness in essentially creative work. And thus it was, as we have seen, with Keats, who caught by turns the spirits of Greece, of Italy, of the North. Landor did the same, with his "Hellenics," with his "Pericles and Aspasia," "Pentameron," and "Citation of Shakspeare." But Landor, with the fieriest personal temper conceivable, was, like Alfieri, though of a totally different school, another being when at work, an artist to his fingers' ends. So was Coleridge at times, when he shook himself like Samson: not the subjective brother-in-arms of Wordsworth, but the Coleridge of the imagination and haunting melody and sovereign judgment unparalleled in his time—Coleridge of "The Ancient Mariner," and "Christabel," and "Kubla Khan," whose loss to the highest field of poetic design is something for which one never can quite forgive theology and metaphysics. Of Wordsworth, the real master of the Victorian self-absorption, I shall speak at another time with respect to our modern conception of the sympathetic quality of nature. To conclude, the prodigal Georgian school, springing from a soil that had lain fallow for a hundred years, was devoted as a whole to self-utterance, but magnificently so. Of course

a reaction set in, and we now complete the more restrained, scholarly, analytic, artistic, Victorian period—a time, I fully believe, of equally imaginative effort, yet of an effort, as we shall see, that usually has taken, so far as concerns dramatic invention, a direction other than rhythmic.

Meanwhile, Heinrich Heine, of the intermediate generation, and the countryman of Goethe, began, one might say, where Byron left off. His whole song is the legacy of his personal mood, but that was full of restless changes from tears and laughter, from melody and love and tenderness, to scorn and cynicism, and again from agnosticism to faith. In youth, and at intervals until his death, his dominant key was like Byron's—dissatisfaction, longing, the pursuit of an illusive ideal, the love of love and fame. There was an apparent decline, after disordered years, in Byron's powers both physical and mental. Yet his Greek campaign bade fair to bring him to something better than his best. He had the soldier's temperament. Action of the heroic kind was what he needed, and might have led to the "sudden making" of a still more splendid name. Heine was many beings in one, a Jew by race, a German by birth, a Parisian by adoption, taste, and instinct for the beautiful. His outlook, then, was broader than that of the English poet. His writing was also a revolt, but against the age as that of a Jew, and against contemporary Philistinism as that of an Arcadian. Byron became a cosmopolite; Heine was born one. In the world's theater he stood behind the scenes of the motley human drama. He wrought its plaint and laughter into a fantastic music of his own, with a genius both sorrowful and sardonic; always like one enduring life as a penance, and suffering from the acute consciousness of some finer existence the clue to which was denied him:

In every clime and country  
There lives a Man of Pain,  
Whose nerves, like chords of lightning,  
Bring fire into his brain:  
To him a whisper is a wound,  
A look or sneer a blow;  
More pangs he feels in years or months  
Than dunces throng'd ages know.

Heine felt, and avowed, that the actual song-motive is a heart-wound, without which "the true poet cannot sing sweetliest." His mocking note, which from its nature was not the sanest art, was quickly caught by younger poets, and repeated as if they too meant it and for its air of experience and maturity. With real maturity they usually hastened to escape from it altogether.

I THINK that the impersonal element in art may be termed masculine, and that there is something feminine in a controlling impulse to lay bare one's own heart and experience. This is as it should be: certainly a man's attributes are pride and strength, strength to wrestle, upon occasion, without speech until the daybreak. The fire of the absolutely virile workman consumes its own smoke. But the artistic temperament is, after all, androgynous. The woman's intuition, sensitiveness, nervous refinement join with the reserved power and creative vigor of the man to form the poet. As those or these predominate, we have the major strain, or the minor appeal for human sympathy and the proffer of it. A man must have a notable gift or a very exalted nature to make people grateful for his confessions. The revelations of the feminine heart are the more beautiful and welcome, because the typical woman is purer, more unselfish, more consecrated, than the typical man. Through her ardent self-revelations our ideals of sanctity are maintained. She may even, like a child, be least self-conscious when most unrestrained in self-expression. Assuredly this was so in the case of the greatest woman-poet the modern world has known. Mrs. Browning's lyrics, every verse sealed with her individuality, glowing with sympathy, and so unconsciously and unselfishly displaying the nobility of her heart and intellect, have made the earth she trod sacred, and her resting-place a shrine. Her impassioned numbers are her most artistic. The "Sonnets from the Portuguese," at the extreme of proud self-avowal, are equal in beauty, feeling, and psychical analysis to any series of sonnets in any tongue—Shakspeare's not excepted.

I have alluded to Alfieri. The poets of modern Italy, romantic as they are, still derive closely from the antique, and they have applied themselves considerably to the drama and to the higher lyrical forms of verse. Chafing as they did so long under the Austrian sway, their more elevated odes, as you will see in Mr. Howells's treatise, have been charged with "the longing for freedom, the same impulse toward unity, toward nationality, toward Italy." Poetry that has been the voice and force of a nation occupies, as I have said, a middle ground between our two extremes. It has an altruistic quality. The same generous fervor preëminently distinguished the trumpet-tongued lyrics of our Hebraic Whittier, and the unique outgivings of Lowell's various muse, in behalf of liberty and right. Those were "Noble Numbers"; and, in truth, the representative national sentiment—of which ideas of liberty, domesticity, and religion are chief components—pervades the lyrics of our elder American poets from Bryant to Taylor and Stoddard. Whitman's faith in

the common people, in democracy strong and simple, has gained him world-wide honor. Subjective as they are, few poets, in any era or country,—and historians will come to recognize this clearly,—have been more national than our own.

THE latest school, with its motto of art for art's sake, has industriously refined music, color, design, and the invention of forms. But its poets and painters show a kind of self-consciousness in the ostentatious preference of their art to themselves, even in their prostration at the feet of "Our Lady of Beauty." Their motive is so intrusive that the result, although alluring, often smacks of artisanship rather than of free and natural art. Their early leaders, such as the young Tennyson and Rossetti in England, and Gautier in France, effected a potent, a charming, a sorely needed restoration of the beautiful. But the Laureate has lived to see another example of his own saying that a good fashion may corrupt the world. The French Parnassians, the English-writing Neo-Romanticists, are more constructive than spontaneous, and decorative most of all. They have so diffused the technic of finished verse that the making of it is no more noteworthy than a certain excellence in piano-playing. They plainly believe, with Schopenhauer, that "Everything has been sung. Everything has been cursed. There is nothing left for poetry but to be the glowing forge of words."

This curious, seemingly impersonal poetry, composed with set purpose, finds a counterpart in some of the bewildering recent architecture. How rarely can we say of the architect and his work,

He builded better than he knew:  
The conscious stone to beauty grew.

The artist and the builder are too seldom one. The poet just quoted, when on a trip to New Hampshire, found a large building going up in a country town. "Who is the architect?" he said. "Oh, there is n't any architect settled upon as yet," was the reply; "I'm just a-building it, you see, and there's a chap coming from Boston next month to put the architecture into it." So it is with a good deal of our latter-day verse. It does not rise "like an exhalation." It is merely the similitude of the impersonal, and art for the artist's sake rather than for the sake of art. Its one claim to objectivity is, in fact, the lack of any style whatever—except that derived by the rank and file from their study of the chiefs. It is all in the fashion, and all done equally well. Even the leaders, true and individual poets as they have been,—Tennyson, Rossetti, Swinburne, Mor-

ris, Sully Prudhomme, Banville,—often have seemed to compose perfunctorily, not from inspired impulse. Read "The Earthly Paradise," that seductive, tranquilizing, prolonged, picturesque rehearsal of the old wonder-tales. Its phantasmagoric golden haze, so often passing into twilight sadness, has veiled the quality of youth in those immortal legends. What is this that Morris fails to capture in his forays upon the "Odyssey," the "Decameron," Chaucer, the "Gesta Romanorum," the "Edda," the "Nibelungen Lied"? Can it never come again? Has it really passed away? Did it wake for the last time in those lusty octosyllabic romances of the Wizard of the North, such as "Marmion" and the "Lay of the Last Minstrel"? Careless, faulty, diffuse as they were, those cantos were as alive as Scotland herself, and fresh with the same natural genius, disdaining to hoard itself, that produced the Waverley novels. If Scott has had no successor, it is doubtless because the age has needed none. We have moved into another plane, not necessarily a lower but certainly a different one.

With respect to style, Swinburne is the most subjective of contemporary poets, yet he has made notable successes in dramatic verse—chief of all, and earliest, the "Atalanta in Calydon," with whose auroral light a new star rose above our horizon. Nothing had been comparable to its imaginative music since the "Prometheus Unbound," and it surpassed even that—for its author had Shelley for a predecessor—in miracles of rhythmic melody. The "Prometheus" surges with its author's appeal from tyranny; "Atalanta" is a pure study in the beautiful, as statuesque as if done in Pentelican marble. Its serene verse, impressive even in the monometric dialogue, its monologues and transcendent choruses,—conceived in the spirit of Grecian art, but introducing cadences unknown before,—all these are of the first order. The human feeling that we miss in "Atalanta" is, on the other hand, a dramatic factor in Swinburne's Trilogy of Mary Stuart. But in his most impersonal work his fiery lyrical gift and individuality will not be suppressed. The noble dramas of Henry Taylor and Hengist Horne are more objective, but cannot vie with Swinburne's in poetic splendor. Now, as you know, this unrivaled voice is instantly recognized in his narrative romances, or in any strophe or stanza of his plenteous odes and songs. The result is that his vogue has suffered. His metrical genius is too specific, too entralling, to be over-long endured. Thus the distinctive tone, however beautiful, which soonest compels attention, as quickly satiates the public. The subjective poets who restrict their fertility, or who die young, are those whom the world canonizes before their bones are dust.

WHILE, then, a few modern poets, at times as absorbed as Greeks in their work, have been strenuously impulsive in temper and the conduct of life,—among them Alfieri, Foscolo, Mazzeini, Landor, Home, and various lights of the art-school from Keats onward,—the artist's temperament usually in the end determines the order of his product: clearly so in such cases as those of Leopardi, James Thomson, Baudelaire, Poe. Sympathetic examination of the poetry will give you the poet. A fine recent instance of an introspective nature overcoming the purpose formed by critical judgment was that of Matthew Arnold. A preface to the second edition of his poems avowed and defended his poetic creed. Reflection upon the antique, and the study of Goethe, had convinced him that only objective art is of value, and that the most of that which is infected with modern sentiment is dilettantism. Art must be preferred to ourselves. Action is the main thing; more than human dramatic greatness alone saves even Shakspeare's dramas from being weakened by "felicities" of thought and expression. The poet-critic accordingly proffered his two heroic episodes, "Balder Dead" and "Sohrab and Rustum"—both "Homeric echoes," though in their slow iambic majesty violating his own canon that the epic movement should be swift. These are indeed the *tours de force* of intellect and constructive taste. There are fine things in both, but the finest passages are reflective, Arnoldian, or, like the sonorous impersonation of the river Oxus, and the picture of Balder's funeral pyre, elaborately descriptive, and unrelated to the action of the poems. Now, these blank-verse structures are not quite spontaneous; they do not possess what Arnold himself calls the "note of the inevitable." The ancients, doing by instinct what he bade us imitate, had no cause to lay down such a maxim as his—that the poet "is most fortunate when he most entirely succeeds in effacing himself." They worked in the manner of their time. Schlegel points out that when even the Greeks imitated Greeks their triumph ended. A modern, who does this upon principle, virtually fails to profit by their example. In the end he has to yield. Arnold was beloved by his pupils—by those whom he stimulated as Emerson stimulated American idealists—for the poetry wherein he was in truth most fortunate, that is, in which he most entirely and unreservedly expressed himself; in verse, for the tender, personal, subtly reflective lyrics that seem like tremulous passages from a psychical journal; most of all, perhaps, for those which so convey the spirit of youth—the youth of his own doubting, searching, freedom-sworn Oxonian group—a group among whom he and Clough, his scholar-gipsy, were leaders in their search for unso-

phisticated nature and life, in their regret for inaction, their yearning for new light, their belief that love and hope are the most that we can get from this mortal existence. It was Arnold's sensitive and introspective temperament, so often saddening him, that brought his intellect into perfect comprehension of Heine, Joubert, Sénancour, and, doubtless, Amiel. His career strengthens my belief that the true way is the natural one—that way into which the artist is led by impulse, modified by the disposition of his time. Burns was a force because he was not Greek, nor even English, but Scottish, entirely national, and withal intensely personal. Scott's epics are founded in the true romantic ballads of the North. A few of us read and delight in "Balder Dead"; "Marmion," a less artistic poem, gave pleasure far and wide, and still holds its own. I confess that this again suggests my old question concerning Landor, "Shall not the wise, no less than the witless, have their poets?" and that, whether wise or otherwise, I prefer to read "Balder Dead"; but I have observed that poetry, however admirable, which appeals solely to a studious class, rarely becomes in the end a part of the world's literature. Palfgrave, in the preface to "The Golden Treasury," significantly declares that he "has found the vague general verdict of popular Fame more just than those have thought who, with too severe a criticism, would confine judgments on poetry to 'the selected few of many generations.'"

Like Arnold, nearly all his famous peers of the recent composite period have made attractive experiments in the objective and antique fields, though less openly upon conviction. Yet Tennyson and Browning are essentially English and modern, as Emerson, Longfellow, Whittier, are American and New-English, while Lowell's memorable verse is true to the atmosphere, landscape, national spirit, dialect, of his own land, and always true to his ethical convictions. Our minor artists in verse succeed as to simplicity and sensuousness in their renaissance work, but fail with respect to its passion—for to simulate that requires vigorous dramatic power. The latter is rarely displayed; its substitute is the note of Self. If this be so, let us make the best of it, and furnish striking individualities for some future age to admire, as we admire the creations of our predecessors. At all events, the poet must not dare anything against nature. Let him obey Wordsworth's injunction,

If thou indeed derive thy light from Heaven,  
Then, to the measure of that heaven-born light,  
Shine, Poet! in thy place, and be content.

BUT are there, then, no dramatic works in recent literature? Yes; more than in any former time, if you do not insist upon poetic form

and rhythm. While the restriction adopted for these lectures excludes that which is merely inventive composition, you know that prose fiction is now the principal result of our dramatic impulse. The great modern novels are more significant than much of our best poetry. What recent impersonal poem or drama, if you except "Faust," excels in force and characterization "Guy Mannering" and the "Bride of Lammermoor," "Notre Dame de Paris," "Les Trois Mousquetaires," "Père Goriot," "On the Heights," "Dimitri Rubini," "Anna Karenina," "With Fire and Sword," "Vanity Fair," "Henry Esmond," "The Newcomes," "Bleak House," "The Tale of Two Cities," "The Cloister and the Hearth," "Westward Ho!" "Adam Bede," "Romola," "Lorna Doone," "Wuthering Heights," "The Pilot," "The Scarlet Letter," and other prose masterpieces with which you are as familiar as were the Athenians with the plays of Euripides? Some of them, it is true, reflect their authors' inner life (but so does "Faust"), and are all the more intense for it. The free nature of the novel seems to make subjectivity itself dramatic. Certainly, the individuality of a Brontë, a Thackeray, a Hawthorne, or a Meredith does not lead us to prefer G. P. R. James, or put them on a lower plane than the strictly objective one of De Foe, Jane Austen, Dumas. Our second-rate novels are chiefly mechanical inventions turned off for a market which the modern press has created and is ominously enlarging. However, with such an outlet for the play of the invention which, three centuries ago, spent its strength upon the rhythmical drama, it is no wonder that even our foremost poets look out to rival ranges, with now and then still another peak above them; and these lectures would seem an anachronism were it not that it is a good time to observe the nature of an object when it is temporarily inactive.

Except for this prose fiction superadded to the best poetic achievements of the modern schools, the nineteenth century would not have been, as I believe it to have been, nearly equal in general literary significance (as in science it is superior) to the best that preceded it. It is difficult for critics to project themselves beyond their time; perceiving its shortcomings, they are prone to underestimate what in after time may seem a peculiar literary eminence. To all the splendor of our greatest fiction must be united the romance of the Georgian poetic school and the composite beauty and thought of the Victorian, that this statement may be sound with respect to the literature of our own language. While poetry and fiction both have to do with verities, Mill was not wrong when he said that the novelist gives us a true picture of life, but the poet, the truth of the soul.

From our survey, after granting that only a

few world-poems exhibit the absolute epic and dramatic impersonality, it by no means follows—in spite of common assertion—that the worth of other poetry is determined by an objective standard. The degree of self-expression is of less moment than that of the poet's genius. Subjective work is judged to be inferior, I take it, from its morbid examples. The visits of the creative masters have been as rare as those of national demigods, and ordinary composers fall immeasurably short of their station. We have the perfect form, historical or fanciful impersonations, but few striking conceptions. The result is less sincere, less inevitable, than the spontaneous utterance of true poets who yield to the passion of self-expression.

YET we have seen that a line can be rather clearly drawn between the pagan and Christian eras, and that there has been a loss. To think of this as a loss without some greater compensation is to believe that modern existence defies the law of evolution and is inferior as a whole to the old; that the soul of Christendom, because more perturbed and introspective, is less elevated than that of antiquity. Contrast the two, and what do we find? First, a willing self-effacement as against the distinction of individuality; secondly, the simple zest of art-creation, as against the luxury of human feeling—a sense that nourishes the flame of consolation and proffers sympathy even as it craves it;

That from its own love Love's delight can tell,  
 And from its own grief guess the shrouded  
 Sorrow;  
 From its own joyousness of Joy can sing;  
 That can predict so well  
 From its own dawn the lustre of to-morrow,  
 The whole flight from the flutter of the wing.

This sympathy, this divinely human love, is our legacy from the Teacher who read all joys and sorrows by reading his own heart, being of like passions with ourselves—a process wisely learned by those fortunate poets who need not fear to obey the maxim, "Look in thy heart and write!"

The Christian motive has intensified the self-expression of the modern singer. That he is subject to dangers from which the pagan was exempt, we cannot deny. His process may result in egotism, conceit, the disturbed vision of eyes too long strained inward, delirious extremes of feeling, decline of the creative gift. Probably the conventual, middle-age Church, with its retreats, penances, ecstasies, was the nursery of our self-absorption and mysticism, the alembic of the vapor which Heine saw in-folding and chilling the Homeric gods when the pale Jew, crowned with thorns, entered and laid

his cross upon their banquet-table. It is not the wings alone of Dürer's mystic "Melencolia" that declare her to be a Christian figure. She sits among the well-used emblems of all arts, the ruins of past achievements, the materials for effort yet to come. Toil is her inspiration, exploration her instinct: she broods, she suffers, she wonders, but must still explore and design. The new learning is her guide, but to what unknown lands? The clue is almost found, yet still escapes her. Of what use are beauty, love, worship, even justice, when above her are the magic square and numbers of destiny, and the passing-bell that sounds the end of all? Before, stretches an ocean that hems her in. What beyond, and after? There is a rainbow of promise in the sky, but even beneath that the baneful portent of a flaming star. Could Dürer's "Melencolia" speak, she might indeed utter the sweet and brave, yet pathetic, poetry of our own speculative day.

Our view of the poetic temperament is doubtless a modern conceit. The ancient took life as he found it, and was content. Death he accepted as a law of nature. Desire, the lust for the unattainable, aspiration, regret,—these are our endowment, and our sufferings are due less to our slights and failures than to our own sensitiveness. Effort is required to free our introspective rapture and suffering from the symptoms of a disease. It is in modern song that great wits to madness nearly are allied. In feverish crises a flood of wild imaginings overwhelms us. Typical poets have acknowledged this—Coleridge, Byron, Heine, who cite also the cases of Collins, Cowper, Novalis, Hoffman, and other children of fantasy and sorrow. Coleridge pointed to those whose genius and pursuits are subjective, as often being diseased; while men of equal fame, whose pursuits are objective and universal, the Newtons and Leibnizes, usually have been long-lived and in robust health. Bear in mind, however, the change latterly exemplified by Wordsworth, Tennyson, Browning, Hugo, and our vigorous American Pleiad of elder minstrels, who have exhibited the sane mind in the sound body. But the question of neurotic disorder did not occur to the age of Sophocles and Pindar. Impersonal effort is as invigorating as nature itself: so much so that Ruskin recognizes the great writer by his guiding us far from himself to the beauty not of his creation; and Couture, a virile figure, avowed that "the decline of art commenced with the appearance of personality." Goethe, in spite of his own theory, admitted that the real fault of the new poets is that "their subjectivity is not important, and that they cannot find matter in the objective." The young poets of our own tongue are not in a very different category. The best critic, then, is the

universalist, who sees the excellence of either phase of expression according as it is natural to one's race and period. A laudable subjectivity dwells in naturalness—the lyrical force of genuine emotions, including those animated by the *Zeitgeist* of one's own day. All other kinds degenerate into sentimentalism.

If we have lost the antique zest, the animal happiness, the naïveté of blessed children who know not the insufficiency of life, or that they shall love and lose and die, we gain a new potency of art in a sublime seriousness, the heroism that confronts destiny, the faculty of sympathetic consolation, and that "most musical, most melancholy" sadness which conveys a rarer beauty than the gladdest joy—the sadness of great souls, the art-equivalent of the melancholy of the Preacher, of Lincoln, of Christ himself, who wept often but was rarely seen to smile. The Christian world has added the minor notes to the gamut of poesy. It discovers that if indeed "our sweetest songs are those which tell of saddest thought," it is better to suffer than to lose the power of suffering.

Commonplace objective work, then, is of no worth compared with the frank revelation of an inspiring soul. Our human feeling now seeks for the personality of the singer to whom we yield our heart. Even Goethe breaks out with "Personality is everything in art and poetry," Schlegel declares that "A man can give nothing to his fellow-man but himself," and Joubert—whom Sainte-Beuve has followed—says, "We must have the man . . . It is human warmth and almost human substance which gives to all things that quality which charms us." This fact is a stronghold for the true impressionists. The special way in which his theme strikes the artist is his latter-day appeal. And what is style? That must be subjective. Some believe it to be the only thing which is the author's own. The modern mind understands that its compensation for the loss of absolute vision is the increase of types, the extension of range and variousness. These draw us nearer the plan of nature, that makes no two leaves alike. The value of a new piece of art now is the tone peculiar to its maker's genius. Death in art, as in nature, is now the loss of individuality—a resolution into the elements. We seek the man behind the most impersonal work; more, the world conceives for itself ideals of its poets, artists, and heroes, plainly different from what they were, yet adapted to the suggestions received from their works and deeds.

My summary, then, is that the test of poetry is not by its degree of objectivity. Our inquiry concerns the poet's inspiration, his production of beauty in sound and sense, his imagination, passion, insight, thought, motive. Impersonal

work may be never so correct, and yet tame and ineffective. Such are many of the formal dramas and pseudo-classical idyls with which modern literature teems. Go to, say their authors, let us choose subjects and make poems. The true bard is chosen by his theme. Lowell "waits" for "subjects that hunt me." Where the nature of the singer is noble, his inner life superior to that of other men, the more he gives us of it the more deeply we are moved. We suffer with him; he makes us sharers of his own joy. In any case the value of the poem lies in the credentials of the poet.

It is the same with all other speculations upon art: with that, for instance, concerning realism and romanticism, of late so tediously bruited. Debate of this sort, even when relating to the Southern and the Wagnerian schools of music, or to impressional and academic modes of painting, is often inessential. It has, perchance, a certain value in stimulating the members of opposing schools. The true question is, How good is each in its kind? How striking is the gift of him who works in either fashion? Genius will inevitably find its own fashion, and as inevitably will pursue it.

*Edmund Clarence Stedman.*

## NATURE.

I MUSE on yonder barren autumn field,  
Where west winds blow, birds sing,  
Rains fall, comes June, comes spring,  
Its secret many a year hath not revealed.

There many a dewy dawn hath writ in red  
And white, and summer's feet  
Left many an imprint sweet,  
Yet something longed for hovers still unsaid.

Ten thousand sunsets have not waked to speech  
The western slopes, nor night's  
Pale flock of stars the heights;  
The sea's kiss wins no answer from the beach.

Dead, silent, nature stands before our eyes.  
We question her in vain,  
And bootless strive to gain  
Her confidence; she vouchsafes no replies.

And yet, oftimes I think she yearns to bless  
And comfort man with sheaves,  
To please him with her leaves —  
The wildest blast hath tones of tenderness.

And there are voices on the sea in storm  
Not of the waters' strife:  
Faint tones, as though some life  
Amid the tumult struggled to take form.

There is an undertone in everything,  
That comforts and uplifts,  
A light that never shifts  
Shines out of touch on the horizon ring.

I know, behind yon mountain's gloomy sides,  
There 's something waits for me  
That I may never see —  
Some love-illumined face, some stretched hand hides.

Some spirit, something earth would half disclose,  
Half hide, invites the soul  
Unto some hidden goal,  
Which may be death, or larger life — who knows?

*William Prescott Foster.*

## MOUNT SAINT ELIAS REVISITED.<sup>1</sup>

THE National Geographic Society, in connection with the United States Geological Survey, sent a small exploring party to Mount St. Elias, Alaska, in the summer of 1890.<sup>2</sup> The country visited during that expedition proved to be so interesting that a second expedition to the same region was decided on. The object of the second expedition was the extension of the surveys previously begun, and the ascent of Mount St. Elias. Like the first, it was placed in my charge. My party consisted of six camp hands, but did not include any scientific assistants. The camp hands were Thomas P. Stamy, J. H. Crumbach, Thomas White, Neil McCarty, Frank G. Warner, and Will C. Moore. The first three were also members of the expedition of 1890. The necessary preparations for camp life were made at Seattle, Washington, late in May, 1891. We sailed from Port Townsend early on the morning of May 30, on the United States revenue steamer *Bear*, in command of Captain M. A. Healy, and after a pleasant voyage reached Yakutat, Alaska, on June 4. Arrangements were made there with the Rev. Karl J. Hendricksen, in charge of the Swedish Mission, to meet us on our return at the head of Yakutat Bay on September 25, with a boat and some provisions which we left at the Mission.

The weather on June 5 being thick and stormy, the *Bear* remained at her anchorage until early the next morning, when she started toward Icy Bay, fifty miles west of Yakutat, the locality chosen for beginning our work. At nine o'clock we were about a mile off shore at the place designated on the charts as Icy Bay, although, as previously known, no bay now exists there. The weather was calm. Scarcely a ripple disturbed the surface of the sea, but the usual ocean swell was breaking in long lines of foam on the low sandy beach. A boat was lowered, and Lieutenant D. H. Jarvis went shoreward to examine the surf and choose a place for landing. He returned in about an hour, and reported that landing seemed practicable at a point which we found afterward was about a mile east of the principal mouth of the Yahrtse River. Owing to the unfavorable

condition of the surf, except at high tide, the landing of our party with its stores, instruments, etc., was not completed until early on the morning of June 8. As our landing was accompanied by a sad accident, in which the lives of six brave men were lost, I shall pass briefly over the painful incident. The boats that took us ashore were in command of Lieutenants G. McConnell, H. M. Broadbent, D. H. Jarvis, and L. L. Robinson. Three of the boats capsized, one of which was in charge of Lieutenant Robinson, and from that boat only one man reached shore alive. Lieutenant Robinson, four of his boat's crew, and Will C. Moore of my party were drowned. I cannot speak too highly of the kindness we received from Captain Healy and from the officers associated with him, or of the bravery with which the lieutenants I have mentioned, and the men under their command, faced imminent danger and suffered no small hardships in order to facilitate the work of our expedition. Lieutenant Robinson's body was recovered by his comrades and taken to Sitka for interment. The remainder of the men lost were buried near where their bodies were washed ashore.

The *Bear* steamed away to the southwest about three o'clock in the morning of June 8, leaving my party to begin the work which was to occupy us for several months. Our first effort after landing was to remove our "outfit" from the low sand-bar, where it was liable to be washed away should a high tide be accompanied by a shoreward-blowing gale, to a place of safety in the edge of the forest to the eastward. There we established a camp in a delightful spot, about a mile from the sea, and on the border of an open meadow, which was white with strawberry blossoms. West of the Yahrtse, and beyond a plateau of broken ice ten or fifteen miles broad, formed by a lobe of the Malaspina glacier, rises a range of "hills," as we called them, in contrast with the greater mountains near at hand, which present abrupt precipices between three and four thousand feet high, to the south. Their northern slopes are more gentle, and are deeply buried beneath snow-fields which contribute to swell the flood of the great Guyot glacier. This splendid range has been named the Robinson Hills, in memory of Lieutenant L. L. Robinson. Our general line of march from Icy Bay was almost due north. For about five miles we traversed broad, barren openings through the forest, formed by the flood-plains of swift glacial streams. The conditions of travel were very favorable, except where the streams were too swift and too deep

<sup>1</sup> The pictures in this article have been drawn from photographs taken by the expedition.

<sup>2</sup> A brief account of the expedition of 1890 appeared in THE CENTURY MAGAZINE for April, 1891, and more fully in the National Geographic Magazine for May, 1891.

to wade, or the sand in their bottoms so soft that it approached the condition of quicksand. Once while returning from a camp at the Chaix Hills to Icy Bay, not being able to find logs with which to make a raft, we had to swim one swift icy stream, and wade another that was considerably more than waist deep. A plunge into ice-water on a chilly, rainy day is far from pleasant, but can be endured if one takes it boldly. To wade slowly out from shore until deep water is reached is a torture that few can withstand. The best way is to take a heroic plunge where the bank is steep, and make the change from air to water as nearly instantaneous as possible.

From a camp at the foot of the Malaspina glacier we cut a trail, about four miles long, through the exceedingly dense vegetation growing on the moraines which cover the outer margin of the ice-sheet. This vegetation is a continuation of the forest covering the flat lands to the south, and extends without a break up over the steep face of the glacier, and thence inland in many places to a distance of from four to five miles. North of the belt of vegetation covering the border of the glacier, we crossed twelve or fifteen miles of exceedingly rough moraine-covered ice and reached the Chaix Hills, which we climbed. Their southern slope is bare of vegetation except at the base, and is buttressed by many sharp ridges, too steep to climb, which unite to form pinnacles above. Joining the pinnacles are graceful curves formed by the exceedingly sharp crest. Their topographic forms alone are sufficient to show the geologist that they have resulted from a very recent uplift. We are told that the architects of India placed outstanding pavilions from which to view the beauties of their "dreams in marble"; so in Alaska, on an infinitely grander scale, the Chaix Hills, situated ten miles in front of the vast southward-facing precipice of the St. Elias range, afford a point of observation that can not be surpassed.

The Chaix Hills rise through a sea of ice, the limits of which can not be determined from their summits. Looking east, and south, there is nothing in sight but an apparently limitless plateau of ice, forming the Malaspina glacier. To the north there is a belt of irregular hilly ground covered by snow-fields and glaciers, and bristling with peaks, which are barren and naked during the summer season. Looking over these, the entire southern slope of Mount St. Elias is in full view. A seemingly level field of ice, forming the Libbey glacier, stretches up to the immediate base of the vast precipice leading to the top of the range. The elevation of the actual base of the mountain is about 2000 feet. The precipitous slope rising above it is 16,000 feet high. The snow breaking away

near the top of the mountain rushes down in great avalanches to its very base, and is precipitated upon the surface of the glacier below. Mount St. Elias terminates at the top in a massive pyramid, from the base of which, as seen from the south, a prominent shoulder rises on each side. The eastern shoulder has an elevation of 14,600 feet at its extremity; it then falls off abruptly, and the range terminates about six miles to the east of the main summit. The west shoulder is 16,400 feet high, and beyond it to the west there is a steep descent in the crest line, but the range is continued indefinitely toward the northwest, and bristles with magnificent peaks and sharp crests as far as the eye can reach. Northeast from the Chaix Hills, across a portion of the Malaspina glacier, are the Samovar Hills, which are also, at least in part, formed of stratified morainal deposits, and, like the Chaix Hills, have been sculptured into a multitude of picturesque tent-like forms. Beyond the Samovar Hills rise the sharp peaks of the Hitchcock range, and the white pinnacles and domes of Mount Cook and Mount Irving. They are among the most attractive mountains in the entire Mount St. Elias region. Between Mounts Irving and St. Elias is the Augusta range, on which rise Mounts Augusta, Malaspina, Jeannette, Newton, and several other prominent snow-clad peaks. Far away to the southeast, beyond the Malaspina glacier, is a host of marvelous mountains, lessening in perspective, until the commanding summit of Mount Fairweather terminates the magnificent panorama. On perfectly clear days, when there is not a vapor wreath anywhere about the mountains, it is difficult to realize their full magnificence, owing to the absence of shadows and an apparent flattening of the rugged slopes. On such rare, perfect days there frequently comes a change. The cold winds from the vast ice-fields north of the mountains are beaten back by warm, moist winds from the south, and cloud-wreaths appear in horizontal bands far below the gleaming summits. Under such conditions the mountains lose their flatness, and buttresses and amphitheatres appear where before were expressionless walls. The mountains seem to awaken, and to become aware of their own dignity and sublimity. Usually the first sign of a coming change, when the weather is clear, is a small cloud-banner on the extreme summit of St. Elias. This signal is a warning that can be seen for a hundred and fifty miles in every direction and should not be ignored. Soon other peaks repeat the alarm, like bale-fires in time of invasion, and Mounts Augusta, Cook, and far-away Fairweather fling out their beacons to show that a storm is nigh.

Repairing to a cache that had been left on the border of the clearing southeast of the

Chaix Hills, we made a camp on the glacier, having the luxury, however, of a thin layer of broken slate beneath our blankets; and on the next day, July 8, advanced about five miles northward, when we again encamped on a thin moraine composed of black slate, and the day following brought up the remainder of our supplies. On July 10 we had breakfast at midnight, and began a weary tramp through soft snow to the Samovar Hills. Strange mirage effects appeared on the vast ice-fields when the sun arose. A white mist gathered about us when the warm sunlight touched the glacier, and we traveled on, guiding our course by compass. The light shining through the mist made white halos of remarkable beauty, which lessened the monotony of traveling through the fog. The snow became very soft and every step was wearisome, but still we pressed on, hour after hour, as there was no halting-place. We finally reached the extreme west end of the Samovar Hills, and pitched our tents on a little hillock of mosses and flowers, from which the snow had recently retreated. At our camping-place the Agassiz glacier emerges from a deep cañon about three miles broad, and descending a steep slope, which is a continuation of the precipitous southern face of the Samovar Hills, forms a splendid ice-fall that bristles with pinnacles and ice-blades separated by deep blue crevasses. Late in the afternoon of July 12 we worked our way, with the sled lightly loaded, up the border of the ice-fall near camp, and, after reaching its summit and threading the maze of crevasses just above, gained the center of the glacier. The snow ahead seeming smooth and unobstructed, we left the sled and returned to camp, where each man shouldered a heavy pack and started up the ice-fall once more, while I remained in camp, having enough to occupy my attention during the next day in the neighboring hills. The plan was for the men to advance with the sled as far up the Agassiz glacier as they could during the cold hours of the night when the snow was hard; then to make a cache and return the next day.

The men regained the sled in safety, and, after packing their loads upon it, began the weary tramp; but they had scarcely gone a hundred yards when Stacy and White, who were in the lead, felt the snow give way, and fell about twenty feet into a crevasse. The snow covering the crevasse had previously fallen in, leaving a thin, unbroken dome, but had caught in the fissure and formed a kind of bridge on which the men alighted; except for this they would have gone down to unknown depths. The snow that fell in with them fortunately prevented their moving until McCarty, with great promptness and presence of mind, lowered a rope, and they were assisted to the

surface. This accident came nearer being serious than any other we had while on the ice, and served as a warning. After its occurrence we did not begin our night marches until an hour or two past midnight, when the twilight had increased in brightness sufficiently to make traveling safe. On our return, in passing the same ice-fall, we had another accident similar to the one just described. We were marching in single file, and, feeling perhaps over-confident after living for weeks on the glaciers, did not attach ourselves to a life-line, as was our custom in marching over snow which might conceal dangerous crevasses. I was in the lead, and just after passing safely over a snow-covered crevasse heard an exclamation from White, who followed a few steps in my rear, and on looking back saw that he had disappeared, leaving only a hole in the snow to indicate the direction of his departure. Returning quickly, I looked down the hole but saw only the walls of a blue crevasse; a curve in the opening had carried my companion out of sight. He replied to my shout, however, and with the aid of a line was soon on the surface again, uninjured. On the night when Stacy and White came so near losing their lives, several efforts were made by the men to continue their march, but crevasses thinly covered with snow were found to bar their way in every direction but the one by which they arrived. At last they abandoned the attempt to advance, and returned to camp. Early the following day we all returned to the sled, and by skirting along the side of the glacier, and in places climbing along the steep, snow-covered hillside, managed to get around the difficult tract and make a long march ahead.

The Agassiz glacier above the fall at the Samovar Hills is remarkably smooth, and but little crevassed, except along its immediate borders. Its principal tributary is the Newton glacier, which occupies an exceedingly wild valley between the east end of the St. Elias range and the west end of the Augusta range. These two ranges overlap *en échelon*, and each is exceedingly steep and rugged. The walls overlooking the glacier on either side are seldom less than 10,000 feet high, while the peaks that bristle along their crests rise to elevations of from 12,000 to 14,000 feet. At the foot of the ice-fall over which the Newton glacier descends and becomes a part of the Agassiz glacier, the elevation is 3000 feet above the sea. The amphitheater where the glacier has its principal source, between Mount St. Elias and Mount Newton, has an elevation of a little over 8000 feet. The glacier makes this descent of about 5000 feet principally at four localities where ice-falls occur. Between the falls the slope is quite gentle, and in some places the grade is reversed; that is, the ice rises bodily to some extent when pass-

SKETCH MAP OF THE MOUNT SAINT ELIAS REGION, PREPARED BY THE U. S. GEOLOGICAL SURVEY.

ing over obstructions. We made two camps on the broad, undulating surface of the Agassiz glacier, each of them at the margin of a lake of the most wonderful blue. At the higher of these camps we abandoned our sled, which had done good service, and resumed "packing" our outfit. The first ice-fall above was passed by scaling the steep rock-cliff where it emerges from beneath the ice on the west. The actual vertical descent is about five hundred feet. The ice in plunging over the precipice is broken into tables and columns of great beauty. This fall differs in character from the fall in the Agassiz glacier at the end of the Samovar Hills, owing to the fact that it is well above the snow-line and in the *névé* region. The columns on the steepest part of the fall are not thin spires and blades of ice, as in similar situations lower down, but prisms and pilasters of homogeneous snow, which breaks like granular marble and is without structure, excepting lines of horizontal stratification. Above the fall the glacier is broken from side to side into rudely rectangular tables, and as these are carried over the steep descent they become separated, and frequently stand as isolated columns a hundred feet high, supporting massive capitals. The architectural resemblances of these columns, all of the purest white with deep blue chasms between, are often very striking, especially in the twilight of the short summer nights, when they appear like the ruins of marble temples. Above the first fall we traversed a great area where the crevasses were

long and wide, and separated level-topped tables of snow as large as blocks of city houses, many of which were tilted in various directions. We then came to a second fall, less grand than the first, but more difficult to scale, owing to the fact that we could not climb the cliff at the side, but had to work our way up through partially filled crevasses in the fall itself, and to cut steps in the sides of vertical snow-cliffs. Once, after an hour of hard work in cutting steps up an overhanging snow-cliff and gaining the top, we found ourselves on a broad table separated from its neighbors on all sides by profound crevasses, and had to retreat and try another way. At length we gained the snow-slope on the mountain-side overlooking the broken region below, and found an open way, although exposed to avalanches, up to Rope Cliff, which had given us some trouble the year before. Knowing the conditions at Rope Cliff, however, it did not cause delay. One of us climbed the rock-face and fastened a rope around a large stone at the top, which made future ascents and descents easy. Fragments of the rope left at this place the year before were found. This was the only trace of our former trail that we saw; all else had been obliterated by the deep snows of winter.

About two miles above Rope Cliff we entered a region of huge crevasses, near the place where we had to cut steps up a precipice of snow the year previous. The breaks in the snow were not only numerous, but broad and

deep, extending clear across the glacier. On the south there was a big wall of snow parallel with the course of the glacier, and connecting with the cliffs above in such a manner that we could not pass around it. We encamped on a table of snow surrounded on all sides by cre-

A CAÑON IN THE CHAI HILLS.

vasses, but inclined so that we could cross to a neighboring table, and there spent the night. An examination of the broken snow ahead from the upturned edge of a fallen snow-block of great dimensions failed to show any practicable way to advance. From our elevated station we could see entirely across the glacier, but, in attempting to pick out a way through the maze of crevasses, always came to a yawning blue gulf or to an impassable wall of snow. At last, almost in desperation, we decided to cut steps up the great wall that ran parallel with the glacier, trusting that the surface above would be connected with the less broken region above the fall. This cliff of snow, which we called White Cliff, was the upper side of a great crevasse, the lower lip of which had fallen and partially filled the gulf at its base. To reach its foot we had to cut steps down a cliff of snow about fifty feet high, and work our way across a partially filled crevasse of profound depth to a table of snow forming a terrace on the opposite side. From this terrace we could cross another small crevasse on broken, angular snow-blocks which partially filled it, and gain the base of the cliff. Above us rose a wall of snow 200 feet high, with an overhanging cornice-like ridge midway up, which projected five or six feet from the face of the cliff and was eight feet thick. McCarty and Stamy were with me, and we began to cut steps, taking advantage of a diagonal crack in the cliff which assisted considerably in the task. All the way up to the cornice we had to hold on by alpenstocks while we used our ice-axes. Reaching the cornice, an opening was cut through it, McCarty and Stamy doing the

greater part of the work. Once above the cornice, the slope was less steep, and McCarty, by using two alpenstocks, was able to ascend the rest of the way without using an ice-ax. Placing an alpenstock firmly in the snow at the top, and making a rope fast to it, our packs were hauled up and we were all soon at the top.

Other great crevasses occurred above White Cliff, but they were in the bordering snow-field and not in the glacier proper, and ran in the direction we wished to travel. By following the broad surface between two of the great gorges we advanced to the point where we had our highest camp the year previous, and then began the ascent of the last ice-fall in the Newton glacier. This fall was higher than any previously encountered, but not so steep, and the blocks of snow were larger. The ascent to the amphitheater above is over 1000 feet. The day we made the climb we reached the foot of the fall about six in the morning, and found the snow soft and traveling difficult. The day was hot, and the elevation being considerable our task proved a fatiguing one. At length we reached the vast amphitheater in which the Newton glacier has its source, and pitched our tent as far within the entrance as safety from avalanches would permit. This proved to be our highest camp, its elevation being a little over 8000 feet.

During the ascent of the Newton glacier the weather had become more unsettled than in the earlier part of the season, which was due in great measure to our increased elevation. While enjoying fair weather near the coast, we did not appreciate the fact that every cloud which wrapped its soft sunlit folds about the higher mountains was accompanied by a local snow-storm. We soon learned, however, that not every cloud has a silver lining. Mist and rain delayed our progress and made our camps on the snow wretchedly uncomfortable, yet they added variety and beauty to the wonderful scenery of the snow-covered mountains, and brought out a world of beauty that would never be suspected if the air always retained its transparency and the sun always shone with blinding intensity. As we ascended the Newton glacier, and gained the summit of one ice-fall after another, the panorama of mighty snow-covered peaks and broad, crevassed glaciers became more and more unfolded, and more and more magnificent. The view eastward down the glacier is one of the most impressive pictures that even Alaskan mountains can furnish. The cliffs of the St. Elias range on the south, and of the Augusta range on the north, rise near at hand to great heights, and are as rugged and angular as it is possible for mountains to be. The snow-covered slopes are utterly bare of vegetation; not even a

lichen tints the isolated outcrops of rock. Looking eastward between the two lines of precipices towering over a mile in height, and rising above into pinnacles and crests, the eye follows the descending slope of the glacier, which expands as new ice-streams pour in flood after flood of ice. The surface of the glacier appears rugged in the foreground, but is softened in the distance until only the broadest of the blue gashes that break its surface are visible. Five or six miles

the clustered domes and pinnacles of Mount Cook and Mount Irving, two sister peaks of equal grandeur. Beyond these, glimpses may be had at certain stations of Mount Vancouver, and of still other shining summits which are not named, and perhaps were never before seen by human eyes.

The view down the glacier is a winter landscape. In the full noontide the scene is of dazzling whiteness, except where cliffs cast their

away is a heavily snow-covered group of hills, a spur of the Augusta range, which deflects the glacier to the south and causes it to disappear beyond a rugged headland of rocks and snow. Rising above the foot-hills that turn the frozen current are magnificent peaks, the like of which are seldom seen, and are utterly unknown to all who have not ventured into the frozen solitudes of lofty mountains. Mount Malaspina and Mount Augusta, cathedrals more sublime than ever human architect dreamed of, limit the view on the northeast. To the right of these, and forming the background of the picture, rise

shadows or clouds screen the sunlight. The snow-fields and the snow-curtained precipices, when in shadow, have a delicate blue tint that seems almost a phosphorescence. Except on rare occasions, the only colors are white and many shades of blue, with dark relief here and there where the cliffs are too precipitous to retain a covering. Sometimes the sunlight, shining through delicate clouds of ice-spicules, spreads a halo of brilliant colors around some shining summit, or, striking the surface of a snow-field at the proper angle, spreads over it a web of rainbow tints as delicate and change-

MOUNT SAINT ELIAS FROM THE NEWTON GLACIER.

able as the pearly lining of a sea-shell. The sheen on the surface of the frosted snow suggests the fancy that there the spirits of the Alpine flowers have their paradise.

Beautiful as were the every-day scenes about our camps in the snow, there came at length one rare evening when the mountains assumed a superlative grandeur. We had retired to our tent early in the evening, but on looking out a few hours afterward to see if the conditions were favorable for making a night march, I was surprised to see the change that had taken place in the usually pale-blue night landscape. The sun had long since gone down behind the great peaks to the northwest, but an afterglow of unusual brightness was shining through the deep clefts in the Augusta range, and illuminating a few mountain-slopes here and there which chanced to be so placed as to catch the level shafts of rosy light. The contrast between the peaks and snow-fields of delicate blue faintly illuminated by the light of the moon, and the massive mountains of flame, made one of the most striking scenes that can be imagined. The boldness and strength of the picture, the wonderful detail of every illuminated precipice and glittering ice-field, in contrast with the uncertain, shadowy forms of half-revealed pinnacles and spires, together with the absence of light in the sky and the absolute stillness of the mighty encampment of snowy mountains, was something so strange and unreal that it bordered on the supernatural.

But the great mountains are not always beautiful or always inspiring. When the clouds thickened about us and enshrouded our lonely tent,

which always seemed lost in the vast wilderness of snow and ice, and when the snow fell in fine crystals hour after hour and day after day with unvarying monotony, burying our tent and blotting out the trail which was our only connection with the land of verdure and flowers in the region below, our life was dreary enough. Camp-fires, the ingleside of tent life, were impossible, as we were over 6000 feet above the timber-line, and fully 30 miles distant from the nearest trees. During storms there was nothing to be seen from our tent but the white snow immediately around us, and the vapor- and snow-filled air above. The only evidence of the near presence of lofty mountains was the frequent crash and prolonged, rumbling roar of avalanches, which shook the glacier beneath and seemed to threaten us with annihilation. We occupied our camp at the entrance of the amphitheater at the head of the Newton glacier for twelve days, and during that time, owing to the prevalence of clouds and snow-storms, were able to advance only once.

On the morning of July 24, McCarty, Stamy, and I were early astir, and, having had our breakfast, left the tent at two o'clock and started to climb to the divide between Mount Newton and Mount St. Elias, and as much higher as possible. The morning was clear and cold, but the snow, owing to its extreme dryness, was scarcely firm enough to sustain our weight. On account of the advance of the season, we now had about four hours each night during which the light was not sufficient, even during clear weather, to allow us to travel

over crevassed ice in safety. When we started, the twilight was sufficiently bright to reveal the outlines of the great peaks about us, but every detail in their rugged sides was lost. All within the vast amphitheater was dark and shadowy. On our right rose Mount Newton in almost vertical precipices a mile in height, with great glaciers pouring down like frozen cataracts from unseen regions above. On the left stood the crowning pyramid of Mount St. Elias, its roof-like slope rising nearly two miles in vertical height above the even snow-field we were crossing. The saddle between these two giant summits is the lowest point in the wall of the amphitheater, but even that was 4000 feet above us.

During the earlier portion of our stay in our highest camp, when the weather was warm and

On the morning of July 24, however, all was still. Jack Frost, working stealthily throughout the night, had silenced the music of the rills, and fettered the mighty avalanches with chains of crystal. As we advanced, the soft twilight grew stronger, and just as we reached the base of the icy precipices we were to scale, on looking up, I saw the summit of Mount St. Elias aflame with the first ruddy light of morning,

An Apennine, touched singly by the sun, Dyed rose-red by some earliest shaft of dawn, While all the other peaks were dark, and slept.

In front of us rose steep cliffs, the height and ruggedness of which appeared to increase as we approached. Across the slope from side to

the peaks surrounded by clouds or shut out from view by snow-storms, the roar of avalanches was frequent both day and night. Sometimes three great snow-slides would come thundering down the cliff at one time, and pour hundreds of tons of snow and ice into the valley. Avalanches of great size were frequent, both from the slopes of Mount Newton and Mount St. Elias, and from the precipices beneath the saddle. To venture into the valley when the south winds were blowing, and the lower ice-slopes were trickling with water, would have been rash in the extreme.

side ran blue walls of ice, marking the upper sides of crevasses. In several places avalanches had broken away, leaving pinnacles and buttresses of stratified snow, 200 or 300 feet high, ready to topple over in their turn as soon as the sun touched them. Trails of rough, broken snow, below the cliffs, marked the paths avalanches had taken during the day previous. On the right of the slope leading to the divide rose the frowning wall of Mount Newton, and on the left the still greater slope of Mount St. Elias. From each of these we had seen magnificent avalanches descend upon the slope we

DRAWN BY JOHN A. FRASER.

A SMALL GLACIER ON THE SIDE OF MOUNT NEWTON.

were to climb; and then, turning, rush down into the valley below. The grooved and ice-sheathed paths of these great snow-slides were plainly visible, and were to be avoided if possible. At first the slope was not so steep but that we could climb by digging in the long spikes with which our shoes were provided, and with the constant aid of our alpenstocks; but soon we came to a broad crevasse which we had to follow for several rods before finding a bridge by which to cross. Owing to the steepness of the slope on which the snow rested, the crevasses were really faults, their upper edges rising high above the lower. This made them especially troublesome in ascending. The bridges spanning the chasms were usually poor, and in crossing them we had to exercise the greatest precautions. In some instances, where

the slivers of ice crossing a crevasse diagonally seemed too weak to hold the weight of a man, should he try to walk across, we would place two alpenstocks from the lower lip out on the central portion of the bridge, and then one of us would crawl out, and lying flat on the bridge, so as to distribute his weight, advance the alpenstock to the other side and so gain the opposite brink. In one place, where the hanging wall of the crevasse offered no ledge or foothold of any kind, we pushed the sharp end of the alpenstock well into it, and one of us, standing on the poles, cut a step in the cliff, and then, making a hand-hold with another alpenstock, cut steps to the top. Some of the way we climbed in the paths of small avalanches that had left rough snow on the slope and saved us the trouble of cutting steps. But for half the

way probably to the divide we had to cut our trail up slopes that were too steep and too smooth to climb. In this way we slowly advanced, varying our course now toward the base of the cliff leading up to Mount Newton, and again toward the great pyramid forming the summit of Mount St. Elias, according as the ascent was more gentle, or the crevasses less difficult, on one side or the other. In two or three instances our progress seemed barred by impassable crevasses, but a search always revealed a bridge or a place where the openings were narrow, and we were able to advance.

At length we could see that only one crevasse intervened between us and the smooth slope leading to the divide. This crossed diagonally downward from the south side of the slope to near the base of Mount Newton. Beyond where it ended on the right there was an exceedingly steep slope, sheathed with ice, that led to the divide. This seemed the only way we could expect to advance. The upper wall of the crevasse rose about fifty feet above its lower edge, and was hung with icicles. At the east end a curtain of ice, starting from the top of the upper wall, arched over and joined the lower brink, leaving a hollow chamber within hung with thousands of icicles. In spite of my anxiety to press on, I could not but admire the beauty of the glittering mass of fluted columns, arranged like the pipes of a great organ and fully exposed to the morning sun at the top, while their tapering ends were lost in the obscurity of the blue gulf below. Each icicle was frosted on one side with snow-flakes that had been blown against it and frozen to its surface. The play of rainbow tints among these millions of flashing crystals and burnished pendants made a scene of unusual beauty, even in a region whose wonders multiply as one advances. The lower lip of the crevasse had been built up with snow blown from the heights above, and formed a sharp-crested drift, along which we worked our way to the north end of the crevasse. I then fastened the end of a life-line about my waist, while Stamy and McCarty, placing an alpenstock deep in the snow and taking a half-turn with the line around it, slowly paid out the slack as I advanced. Where the dome of ice curved down and met the lower edge of the crevasse, there was a little ledge about six inches broad, and where this ended only the overhanging shoulder formed by the dome remained. Once around the shoulder we would be able to reach the ice-slope leading to the divide. Cutting holes through the ice-dome a little below the height of my shoulder, I thrust my left arm through, and thus had a sure hold while cutting steps for my feet. Progressing in this way, I was soon around the curve, out of sight of my companions, and

in a short time gained the foot of the slope leading upward. But I found that the ascent was so steep, and composed of such smooth ice, that it would require several hours of hard work for us to cut a way to the top, and before undertaking such a severe task I concluded to search for a more practicable route. Being no longer engaged in cutting steps, I became aware that I was in a somewhat dangerous position. The dome which I had passed around curved inward just below me, leaving a sheer descent of several hundred feet to the steep slope beneath, which fell away almost perpendicularly into the valley 3000 feet below. Had I fallen, I should have gone to the bottom of the cliffs before stopping, if some yawning crevasse had not received me. I worked my way slowly back to my companions, and we then followed the crevasse in the opposite direction. Near its highest portion there was a narrow space, where the snow blown from above had built up the snow-bank on the lower lip of the crevasse until it touched the top of the cliff of ice formed by the upper wall. The snow had also bridged a deep crevasse that ran at right angles to the main one, thus rendering us double assistance. These bridges were of light snow, and were so thin that we had to exercise great caution in crossing them lest we should break through. McCarty was now in the lead on the line to which we were all fastened, and, slowly making steps up the curtain of snow that descended from the top of the ice-cliff, he made his way upward out of sight of Stamy and myself who waited below. When he had progressed about 100 feet, the length of our line, he planted his alpenstock deep in the snow and shouted for us to come up. With the aid of the line and the steps that had been made, I was soon beside him, and, detaching myself from the line, continued up the slope, leaving the men to coil up the rope and follow.

I was now so near the crest of the divide that only a few yards remained before I should be able to see the country to the north; a vast region which no one had yet beheld. Pressing on, I pictured in fancy the character of the land beyond. Having crossed this same mountain-belt at the head of Lynn Canal, and traversed the country to the north of it, I fancied that I should behold a similar region north of Mount St. Elias. I expected to see a comparatively low, wooded country stretching away to the north, with lakes and rivers and perhaps some signs of human habitation, but I was entirely mistaken. What did meet my eager gaze was a vast snow-covered region, limitless in its expanse, through which hundreds, and perhaps thousands, of barren angular mountain-peaks projected. There was not a stream, not a lake, and not a trace of vegetation of any

LOOKING UP THE NEWTON GLACIER, MOUNT SAINT ELIAS ON THE LEFT.

The \* on the upper border of the picture is placed over the highest point on the mountain-side reached by the explorers.—EDITOR.

kind in sight. A more desolate or a more utterly lifeless land one never beheld. Vast, smooth snow-surfaces, without crevasses or breaks, so far as I could judge, stretched away to unknown distances, broken only by jagged and angular mountain-peaks. The general elevation of the snow-surface is about 8000 feet, and the mountains piercing it are from 10,000 to 12,000 feet, or more, in altitude above the sea. To the northward I could see every detail in the forbidding landscape for miles and miles. The most distant peaks in view in that direction were thirty or forty miles away. One flat-topped mountain, due north by compass from my station, and an exception in its form to all the other peaks, I have called Mount Bear, in memory of the good ship which took us to Icy Bay. The other peaks were too numerous to name. To the southeast rose Mount Fairweather, plainly distinguishable although 200 miles away. At an equal distance to the northwest are two prominent mountain-ranges, the highest peaks of which appeared as lofty as Mount Fairweather. These must be in the vicinity of Mount Wrangle, but their summits were unclouded and gave no token of volcanic activity. I could look down upon the coast about Yakutat Bay, and distinguish each familiar is-

land and headland. The dark shade on the shore, too distant to reveal its nature, was due to the dense forests on the lowlands between the mountains and the sea. This was the only indication of vegetation in all the vast landscape that lay spread out beneath my feet. The few rocks near at hand, which projected above the snow, were without the familiar tints of mosses and lichens. Even the ravens, which sometimes haunt the higher mountains, were nowhere to be seen. Utter desolation claimed the entire land. The view to the north called to mind the pictures given by Arctic explorers of the borders of the great Greenland ice-sheet, where rocky islands, known as "nunataks," alone break the monotony of the boundless sea of ice. The region before me was a land of nunataks.

The divide which we had reached was a narrow crest at the north end, but broadened to about fifty yards at the south. Along each side were snow-banks facing each other, and inclosing a V-shaped area some ten feet lower than the bordering crests of snow. We excavated a little chamber near the base of one of the steep snow-banks, in which to place a small lamp that we had brought with us, and melted some snow to obtain drinking-water. Owing to the lightness of the snow it required some time to get

water enough to quench our intolerable thirst. This allowed us an opportunity to rest and eat a light lunch, while we studied the strange scene before us.

The day of our climb was unusually beautiful. Not a cloud obscured the sky. In the lower world it must have been an exceedingly warm summer day. In the rarer atmosphere with which we were surrounded the sun's rays poured down with dazzling splendor and scorching intensity. We wore deeply colored glasses to protect our eyes, but our faces, although tanned and weather-beaten by nearly two months' constant exposure, were blistered by the heat. Those of my readers who have not climbed high mountains will be surprised, perhaps, when I say that while our faces were actually blistering beneath the intensity of the sun's heat, our shoes immersed in the light snow were frozen stiff. At noon the temperature in the shade was 16° Fahr. The snow was light and dry, and showed no indications of softening, even at the surface. The white cliffs about us glittered like hoarfrost in the intense light.

Having finished our lunch, we passed on up the steep ridge leading from the divide to the summit of Mount St. Elias. We slowly cut our way up the slope, having a sheer descent of from 5000 to 6000 feet below us all the time. The breaking away of a foothold, or the loss of an alpenstock, might at any time have precipitated us down those fearful cliffs, where not even the crevasses would have stopped us before reaching the bottom of the amphitheater in which our tent was placed, fully a mile in vertical descent below. We were now above the region of avalanches, but an occasional roar came faintly through the rarified air, telling that large bodies of snow had broken away somewhere on the slopes below. With these exceptions the only sounds that broke the stillness were from the blows of our ice-ax and the beating of our own hearts. There is no stillness more profound than the silence of the mountains. As we slowly climbed up above the divide we could see more of the country to the northeast of Mount Newton, but in other directions the great panorama remained the same, or became less distinct. A change in the atmosphere, which obscured distant objects while it slightly lessened the painful intensity of the sunlight on the cliffs about us, told that an atmospheric disturbance was in progress, and that a storm was gathering. We pressed on, although the work of cutting steps at the altitude we had reached was exceedingly laborious, and gained a second outcrop of rock. At four o'clock we had attained an elevation of somewhat more than 14,500 feet, as determined by measurements made with two aneroid barometers. The great snow-slope continued to tower

far above us, and we saw with deep regret that we had not the strength to reach the summit and return to our camp, already 6500 feet below us. Concluding that the only practicable plan would be for us to advance our camp on to the divide between Mount St. Elias and Mount Newton, and from there to attempt to reach the summit, we reluctantly turned back.

The descent began at five o'clock, and we experienced but little difficulty in regaining the divide, but had to be exceedingly careful in crossing the snow-bridge on the ice-slope below. In three places the steps cut during the ascent had been swept away by avalanches. At one locality where the trail went down the face of a steep bluff for about a hundred feet, and then ran diagonally along beneath an overhanging precipice of snow, we found that the cliff had broken away, carrying with it the steps cut on our way up. Below where the cliff had been, the avalanche caused by its fall had cut across a loop in our own trail in two places, but had filled a crevasse that had been troublesome to cross on our way up, and thus proved of some assistance. On reaching the top of the cliff where our steps had been we were at a loss to tell what had become of them, until we noticed the trail of the avalanche below. Had the shadows of evening been a little more dense, our return to camp would have been delayed until the next morning. As it was, however, McCarty scrambled down the slope with a rope fastened about his waist, and cut new steps. As we neared the bottom of the valley the light faded, and we had to find our way as best we could, since it was impossible to see the trail. The slopes were less steep than above, however, and we gained the level floor of the amphitheater without mishap. We reached our tent at ten o'clock, just twenty hours after leaving it. Allowing one hour for the cooking of our breakfast and another for preparing supper, but two hours out of twenty-four remained unaccounted for. The deficiency in the number of hours for sleep was compensated, however, by the fact that it was approaching noon the next day before we awoke.

A heavy cloud gathered about the summit of Mount St. Elias on the afternoon of July 25, and on the following day a snow-storm was in full force and continued until the evening of the next day. At one o'clock in the morning of July 27, I looked out of our tent and found a dense fog filling the valley; but at three o'clock the air was clear, and the absence of cloud banners on the high peaks assured us that the day would be fine. We immediately began preparations for climbing to the divide between Mount Newton and Mount St. Elias. Our plan was to make a cache of rations on the divide, and to advance our camp during the next

favorable day. Owing to the delay at the start, we did not reach the foot of the ice-cliffs leading to the divide until the sun was shining full upon them. We began the ascent, but soon the snow, softened by the sun, began to fall in avalanches, which warned us that it was dangerous to proceed. A great avalanche starting far above us on the side of Mount St. Elias came rushing down the roof-like slope with the speed of an express-train. From the foot of the descending mass, tongue-like protrusions of snow shot out in advance, while all above was one vast rolling cloud of snow-spray. Blue crevasses which seemed wide enough to engulf the falling snow were crossed without making the slightest change in its course. On reaching the upper lip of such a gulf the base of the moving mass would shoot out into the air, and seemingly not curve downward at all until it struck the slope below and rushed on with accelerated speed. The rushing, roaring mass was irresistible. Heavy clouds of spray rolling onward, or blown back by the wind that the avalanche generated, became so dense that all beneath was concealed from view. Only a roar like thunder, and the trembling of the glacier on which we stood, told that many tons of ice and snow were involved in the catastrophe. The rushing monster, starting a mile above, came directly toward us until it poured down upon the border of the slope we were ascending; then, changing its course, it thundered on until it reached the floor of the amphitheater far below. The cloud of spray rolled on down the valley, and hung in the air long after the roar of the avalanche had ceased. When it did drift away we saw the fan-shaped mass of broken snow, in which the avalanche ended, looking like the delta of a stream, extending out half a mile into the valley.

With avalanches threatening us from the precipices on either hand, and from the slope up which we wished to ascend, it seemed foolhardy to persist in the attempt to reach the divide that day; so we left our packs in as sheltered a spot as we could find and beat a retreat. The next morning another snow-storm swept over the mountains, and the weather continued stormy for several days.

While Stamy, McCarty, and I were living in the snow, we had a single tent of light cotton cloth, seven feet square at the bottom and five feet high. Our bedding consisted of two sheets of light canvas, used for protecting our blankets, one double woolen blanket, and one light feather-quilt. Our cooking was done over a small coal-oil stove, and our food consisted almost entirely of corn griddle-cakes, bacon or corned beef, and coffee. To live under these conditions at an altitude of 8000 feet, during snow-storms and dense fogs, and

especially when the snow was melting so as to wet our blankets through and through, was very trying. Fearing that if we held on too long we should not have the strength and steadiness of nerve requisite to reach the summit, should the weather permit, I decided, although with great reluctance, to abandon the undertaking and return to Icy Bay. Whether we could advance or not depended on the direction of the wind; should it blow from the north across the broad ice-fields we had seen from the divide, it would bring clear, cold weather, the clouds would vanish from the mountains, and the avalanches be silenced; should it come from the south, it would be warm and moist, the clouds would thicken, and snow-storms and avalanches would render mountain-climbing impossible. The north side of St. Elias is not too steep to climb and offers no insurmountable obstacles, but the climate is very changeable, and clouds and snow-storms are the rule. Reaching the summit depends more upon the chance of getting clear weather at the proper time than on skill in Alpine work.

We began the descent on August 1. The trail leading back had been snowed over and could scarcely be traced; but the fog had lifted, although heavy storm-clouds still enveloped the higher peaks, and we were able to descend without much difficulty. We slowly worked our way through the great crevasses in the fall just below our highest camp, and thence over a comparatively even surface to White Cliff, which we descended with some little difficulty, the steps previously cut having melted away so as to be almost useless. The next day we rejoined the remainder of the party and reached "Sled Camp" on the Agassiz glacier. During our journey down the mountain until reaching the Samovar Hills rain fell almost continuously. At the Samovar Hills we reoccupied our old camp-ground. The flowers were still in bloom, and the air had that delightful fragrance one notices when first venturing into the woods in early spring. The change from the region of eternal snow and ice to an oasis of verdure and of flowers was welcome indeed. From the Samovar Hills we crossed the broad, gently sloping snow-field extending southwest, and made our next camp on a small island in the glacier separated from the northeast end of the Chaix Hills by about two miles of rugged ice. This bright little garden of flowers and ferns we named Moore's Nunatak, in memory of our comrade who was drowned at Icy Bay.

With McCarty and Warner for companions, I again entered the snow-covered region to the north, and made a side trip to the hills intermediate between Mount St. Elias and the Chaix Hills. During this trip, which lasted three days, we had one perfect day of uninterrupted sun-

shine, the beauty of which was enhanced to us by heavy clouds along the mountain-sides, thus furnishing the contrast necessary to bring out the full magnificence of the frozen heights that towered above us. The lakes to the north of the Chaix Hills were still heavily encumbered with ice, and on the hills bare of snow the earliest of spring-flowers were just awakening. It was springtime to us also, after having been in the wintry mountains for several weeks. We enjoyed the warmth of the glad sunshine, the fresh odors that filled the air, and the delicate tints on the flower-covered slopes around us, far more than we did the stern magnificence of the snow-covered precipices of the great mountains. The storms that had recently passed had left the mountains covered with a fresh mantle of brilliant white down to a level of 4000 feet above the sea. The new snow had not yet been torn from the precipices by avalanches, but was clinging to many of the steepest slopes. In the full splendor of a blazing sun the great ranges seemed mountains of light.

Returning to Moore's Nunatak we passed a night, and then rejoined the rest of our party below at our old camp on the south side of the Chaix Hills. A day or two later we crossed the extreme western end of the Malaspina glacier, just at its junction with another vast plateau of ice stretching westward. Where these two ice-fields join there is a depression which marks the subglacial course of the Yahtse River. We encamped near the spot where this strange river emerges in a roaring, rushing torrent of intensely muddy water, and divides into hundreds of branches as it rushes toward the sea. Another short march took us into the dead forest bordering the river on the east, and partially buried by its sediments, and the following day we occupied the site of our first camp at Icy Bay. After reaching Icy Bay we measured a base-line about three miles long on the beach, and from its extremities obtained the angles necessary to determine the height of Mount St. Elias and neighboring peaks. These measurements were repeated many times in order to obtain an accuracy as great as was possible with the method employed. The height

of Mount St. Elias, thus obtained, is 18,100 feet, plus or minus a probable error of less than 100 feet. From this elevation and certain observations made at Port Mulgrave by the United States Coast Survey in 1874, the position of Mount St. Elias is computed to be approximately, lat.  $60^{\circ} 17' 51''$ , long.  $140^{\circ} 55' 30''$ . This result is of considerable interest in connection with the position of the eastern boundary of Alaska.

In the convention between Great Britain and Russia, wherein the boundaries of Alaska are agreed upon, it is stated that the eastern boundary shall begin at the south at Portland Channel, and from there follow the summit of the mountains situated parallel to the coast as far as the intersection of the 141st degree of west longitude. From that point north, the said degree of longitude shall form the boundary to the frozen ocean. Wherever the mountains parallel to the coast to the east of the 141st meridian are "more than ten marine leagues from the ocean, the limit between the British possessions and the line of coast which is to belong to Russia, as above mentioned, shall be formed by a line parallel to the windings of the coast, and which shall never exceed the distance of ten marine leagues therefrom." The distance of Mount St. Elias from the nearest point on the coast is 33 statute miles. As 10 marine leagues are equal to  $34\frac{1}{2}$  statute miles, the mountain-peak is a mile and a half south of the boundary, and therefore in United States territory. It is also  $4' 30''$  longitude, or  $2\frac{1}{2}$  miles east of the 141st meridian. The mountain is thus practically at the intersection of the boundary of southeastern Alaska with the 141st meridian, and is one of the corner monuments of our national boundary.

Our return from Mount St. Elias was no less interesting than the journey up the mountain, but space has not permitted me to linger over its details. Nor can I give at this time a sketch of our long tramp along the margin of the Malaspina glacier from Icy Bay to Yakutat Bay, or of the exploration of Disenchantment Bay, which was fully as novel and instructive as our life above the snow-line.

*Israel C. Russel.*

## THE FIGHT OF THE "ARMSTRONG" PRIVATEER.

TELL the story to your sons  
Of the gallant days of yore  
When the brig of seven guns  
Fought the fleet of seven score,  
From the set of sun till morn, through the long September night —  
Ninety men against two thousand, and the ninety won the fight —  
In the harbor of Fayal the Azore.

Three lofty British ships came a-sailing to Fayal:  
One was a line-of-battle ship, and two were frigates tall;  
Nelson's valiant men of war, brave as Britons ever are,  
Manned the guns they served so well at Aboukir and Trafalgar.  
Lord Dundonald and his fleet at Jamaica far away  
Waited eager for their coming, fretted sore at their delay.  
There was work for men of mettle ere the shameful peace was made,  
And the sword was overbalanced in the sordid scales of trade;  
There were rebel knaves to swing, there were prisoners to bring  
Home in fetters to old England for the glory of the king!

At the setting of the sun and the ebbing of the tide  
Came the great ships one by one, with their portals opened wide,  
And their cannon frowning down on the castle and the town  
And the privateer that lay close inside;  
Came the eighteen-gun *Carnation* and the *Rota*, forty-four,  
And the triple-decked *Plantagenet* an admiral's pennon bore;  
And the privateer grew smaller as their topmasts towered taller,  
And she bent her springs and anchored by the castle on the shore.

Spake the noble Portuguese to the stranger: "Have no fear;  
They are neutral waters these, and your ship is sacred here  
As if fifty stout armadas stood to shelter you from harm,  
For the honor of the Briton will defend you from his arm."  
But the privateersmen said: "Well we know the Englishmen,  
And their faith is written red in the Dartmoor slaughter-pen.  
Come what fortune God may send, we will fight them to the end,  
And the mercy of the sharks may spare us then."

"Seize the pirate where she lies!" cried the English admiral:  
"If the Portuguese protect her, all the worse for Portugal!"  
And four launches at his bidding leaped impatient for the fray,  
Speeding shoreward where the *Armstrong* grim and dark and ready lay.  
Twice she hailed and gave them warning; but the feeble menace scorning,  
On they came in splendid silence, till a cable's-length away —  
Then the Yankee pivot spoke; Pico's thousand echoes woke,  
And four baffled, beaten launches drifted helpless on the bay.

Then the wrath of Lloyd arose till the lion roared again,  
And he called out all his launches and he called five hundred men;

And he gave the word, "No quarter!" and he sent them forth to smite.  
 Heaven help the foe before him when the Briton comes in might!  
 Heaven helped the little *Armstrong* in her hour of bitter need;  
 God Almighty nerved the heart and guided well the arm of Reid.

Launches to port and starboard, launches forward and aft,  
 Fourteen launches together striking the little craft.  
 They hacked at the boarding-nettings, they swarmed above the rail;  
 But the Long Tom roared from his pivot and the grape-shot fell like hail:  
 Pike and pistol and cutlas, and hearts that knew not fear,  
 Bulwarks of brawn and mettle, guarded the privateer.  
 And ever where fight was fiercest the form of Reid was seen;  
 Ever where foes drew nearest, his quick sword fell between.  
 Once in the deadly strife  
 The boarders' leader pressed  
 Forward of all the rest,  
 Challenging life for life;  
 But ere their blades had crossed,  
 A dying sailor tossed  
 His pistol to Reid, and cried,  
 "Now riddle the lubber's hide!"  
 But the privateersman laughed and flung the weapon aside,  
 And he drove his blade to the hilt, and the foeman gasped and died.  
 Then the boarders took to their launches laden with hurt and dead,  
 But little with glory burdened, and out of the battle fled.

Now the tide was at flood again, and the night was almost done,  
 When the sloop-of-war came up with her odds of two to one,  
 And she opened fire; but the *Armstrong* answered her gun for gun,  
 And the gay *Carnation* wilted in half an hour of sun.

Then the *Armstrong*, looking seaward, saw the mighty seventy-four,  
 With her triple tier of cannon, drawing slowly to the shore.  
 And the dauntless captain said: "Take our wounded and our dead,  
 Bear them tenderly to land, for the *Armstrong's* days are o'er;  
 But no foe shall tread her deck and no flag above it wave —  
 To the ship that saved our honor we will give a shipman's grave."  
 So they did as he commanded, and they bore their mates to land,  
 With the figurehead of *Armstrong* and the good sword in his hand.  
 Then they turned the Long Tom downward, and they pierced her oaken side,  
 And they cheered her, and they blessed her, and they sunk her in the tide.

Tell the story to your sons,  
 When the haughty stranger boasts  
 Of his mighty ships and guns  
 And the muster of his hosts,  
 How the word of God was witnessed in the gallant days of yore  
 When the twenty fled from one ere the rising of the sun,  
 In the harbor of Fayal the Azore!

## IV.

### THE WATER'S GECKING.

DOLLY was shelling peas in the vine-shaded corridor that lined the court. In a hammock close by swung Alan, mechanically conning his lesson, while his eye roved the blue sky-field above the house-walls, like a caged bobolink's.

"You have never said a word, good or bad, about young Norrison." It was Alan who spoke. "And that's what I call affectation; it stands to reason you must have thought about him."

"Oh, yes," answered Dolly, prudently; "and I have thought of the way you chose to introduce him. Whatever put it into your head?"

"Well, I knew you'd buck at the name of Norrison," Alan retorted, in the country slang which was supposed to be objectionable to his sister; "and so I thought I'd present him at a safe distance."

"Why should you present him? Do you know him, and did he ask it?"

"He knows the family too well for that. I did it just to see you stare; and he's off my conscience now."

"And on mine; is that what you mean, dear? I don't know why you should feel guilty. Would papa have us less than civil to a stranger asking his way out of the cañon?"

"My father is noted, then, for his hospitality to strangers of the name of Norrison?"

"Hospitality is quite another thing to answering a civil question. What passed between you on the bluffs you know best yourself, and whether you've stretched your commission as your father's son."

"Oh, my father's son! Who cares whose son I am? We're always in some confounded attitude. It's the fault of all proud, poky families like ours; we ought to mix up more, and be more like other people."

"You talk of the family as if you had founded it."

"I intend to found the American branch of it: and I shall go easy when my time comes; I shall not tie up to the first thing I take hold

of. What's this place to us more than another, so we get a living out of the country?"

"A living! Do you think that your father could n't get a living, any place but here?"

"He came to get what he calls a living. He came to found an estate in lands for his children, in a country where land is cheap, and men—like himself, for instance—are dear; so he told me himself."

Dolly flushed at the sneer and the flippant tone, while she could not deny absolutely the truth of her brother's words.

"Very likely; the least of his motives is the one he would put into words. Money-making is a thing even you can understand. It is not to every one he would talk of the greater thing he came for; his chosen work, the nearest to the work of the Creator. Think of that valley as it is now, with a great, useless river bolting through it, carrying away the water that should be the wealth of the land; carrying away gold, too, and hiding it in the black sands. And such an unkind land! Not a tree for miles, nor a little stream for the poor cattle to stop at, but they must travel till they reach the river: and then to think what it would be in twenty years with the water upon it! If it's glorious to discover new lands, is it less so to make them, out of old waste places that part one State from another, and add nothing but miles of distance? And all that it means to you is a 'living'!"

"You need n't sling your blank verse at me. I know what ditches can do; but where are they? Where is this great canal we have been a dog's age building?"

"And what if it were a man's age? Ten acres of land can support one man, so they say; suppose it should take a man his lifetime to turn one hundred acres of desert into homes for ten poor men. And here is a great province given over to drought, and your father has spent fifteen years on the borders of it, telling the rich men how good it is, and how the people need it—"

"Not he!" Alan struck in. "He tells them about the dividends."

"How they want it, then. I'm not claiming it's a charity; but it's turning time and money and knowledge and prophecy to as good use as they can be put."

"It's all very fine, large talk, but we get

<sup>1</sup> Copyright, 1892, by Mary Hallock Foote.

'no for'ader.' 'Poor and poorer we maun be'; and the canal is no nearer than it was ten years ago. Dreams, let me tell you, are not filling at the price."

"Yes; you are always keen for the price. You had better go down to the town and get behind a counter, and then you 'll handle the price of everything, as soon as you part with it, your time in the bargain."

"There are plenty of our name who have stood behind counters, before me."

"I 'm not denying it. There is a canny chiel in every family; and there is one that sticks in the lone minorities, and fights for his dream though it may not fill his stomach. That is our father, bless him! And I love him because he is a mighty dreamer, and a prophet, and a man of faith in more than his pickle money's worth!"

"Dolly, his dream will destroy him. Don't you know that we are beaten? We have been beaten these ten years. Everybody knows it but ourselves. This location is ours only because no one is ready to take it from us."

"You may say that no one is ready! 'Tis not so easy to do a thing as to hinder other people. As for being beaten, I 'll believe it when I hear it from papa. Alan, lad, what hurts me is: here Mr. Price Norrisson has got his son home from Europe to help him in his schemes, so Margaret says; and where is our father's son? Casting eyes on the winning side, and crying that we are beaten!"

"My father's son is here, thank you, staked out in the sage-brush," Alan retorted sulkily; and I 'd like to know how much help Philip Norrisson could give his father, now, if he 'd ad my chances and the no more."

"Bless me! the chances you talk of cost money, and I never yet heard of a son that alled himself injured because his father was not so rich as some others. If our father cannot afford to buy us our teaching he can give it us, and more than we seem likely to 'get away with,' as you say. By the time you are where papa cannot help you, Alan, lad, I think there 'll be money enough to send you to school."

"Well, I wish you would n't 'Alan, lad' me. 's well enough for Margaret, who has noing but the Scotch; but ladies—"

"Yes; Margaret would smile to hear you talk of ladies—that nursed you on her knees and taught you to spell the word. It was when you went beyond Margaret's teaching that you went to learn English of the cowboys, I dare say."

The morning sun was creeping up the wall of the south corridor; it chased Alan out of the room to the step by Dolly's side.

Having come to a knotty place in his Ovid, Alan was not above asking help of his sister. Dolly brushed back the locks of cobweb fine-

ness that clung to her warm forehead, using the back of her hand, her fingers being damp and ruddy with pinching the dewy pea-pods. She leaned over the book without touching it; then changed her mind, and drew back.

"Are we beaten?" she asked defiantly. "Do you say it of your own knowledge?"

"How should I know? I know how the talk goes."

"Oh, the talk! The talk is nothing; 'kintra clatter.'"

Dunsmuir had sunk in his scheme all that he had put into it, save his children and two faithful friends; plain, poor people, staple products of the older countries, proved by every form of discipline known to the new. Job Dutton was a transplanted New Englander from the Western Reserve, the last foreman left on the work from the siftings of years. Margaret, his wife, had come to the cañon as nursemaid to Mrs. Dunsmuir's children. After the lady's death there had been unfortunate insinuations, conveyed in emotional letters—those unconscious vessels of wrath—from her people in Scotland to Dunsmuir, sore with his grief. These he understood to intimate that his wife had been sacrificed to his scheme. Later the family undertook to show him his duty to his children. Dunsmuir declined the interference, and refused to send his babies home; and so the cañon kept them, and Margaret with them. The cañon was responsible for Margaret's marriage, and Job's further entanglement thereby with Dunsmuir's fortunes: for Margaret would not leave the children; the question was never raised between husband and wife, and every year they gave to the cañon life made it harder to break away.

Dunsmuir alone of the household knew its full indebtedness to the cabin; and he fearlessly accepted the obligation as one who is generous himself and confident of his ability to straighten the account. Nor is it likely he could escape from the inbred conviction that it must be a privilege for persons of Margaret's class to be connected in service with persons of his own, with or without remuneration. It is a sentiment that dies hard in the blood of those accustomed to be served, which many pleasing illusions and traditions help to keep alive, even in new countries, where it is imported under conditions often curiously the reverse of feudal.

As the master's income was eaten up by the scheme, sacrifices had to be made, and as a matter of course it was the women who made them, and thought little of it. Since Dolly had gained her growth she had been dressed in the simplest of her mother's gowns, made over to fit her transatlantic slenderness; the grand ones were locked away, up-stairs, in sweet-scented towels, and layers and stuffings of tissue-paper,

in the brass-bound trunks with foreign labels, for Dolly's use should she ever come to the full responsibilities of a young lady's toilet. It was a great satisfaction to Margaret to feel that these were had in reserve. She herself wore sacks and skirts and aprons, chiefly, and thanked the Lord that summer was long in that land, and hoarded her stuff gowns, and was never known to have a new bonnet, and washed the table-linen tenderly, and was jealous of the winds that flapped and twisted it on the lines. But Dunsmuir had his wine and his black coffee at dinner, and his loaf-sugar and lemons, with something stronger at bedtime,—which time with him was anywhere between midnight and two in the morning; those bright, electric nights of summer were ill for sleeping,—and his pipe was seldom cold, and was fragrant, always, of the best "mixture." He knew not how to economize in small details, and was not young enough to learn; but in a total deficit he could have gone without and never would have complained. He owned his weakness when Margaret sternly returned to his wardrobe garments which he had prodigally bestowed upon Job; he put them on again and wore them in a spirit of manly acquiescence in matters beyond his knowledge, not to say control. Margaret counted the silk handkerchiefs that were spared him as if they had been bank-notes, and his shirts and socks lasted in a way that was miraculous to Dunsmuir, who never looked to trace their history through a pathetic extension of darns. Had it not been for the hard wear on his clothes Margaret would sooner have seen him "howkin' stane" on the hillside with the men, than wearing out his heart over such toys as he mostly filled his time withal.

Hearts outlast the coats that cover them, and Dunsmuir's heart was yet strong in hope. But the sickening inertia of his life, the long tale of disappointment, was beginning to tell upon him. His temper was giving; he was weary of marking time; the dry summers bred in him a low fever that wasted his flesh, and quickened his pulse, and kept him thrashing about in his bed at night; and the river's mounting cry, borne past his window on the gulch wind, woke the echoes of all the sorrows he had ever known.

To-night, as usual, Dolly prepared her father's tray for his bedtime refreshment. Its place was on the corner-table by the cupboard in his study. Margaret never broke anything, and the same cut-glass tumbler Dunsmuir had mixed his toddy in, the first summer in the cañon, was still the one he used. Then she looked into the cupboard to see if the Wedgwood biscuit-jar needed replenishing; screwed down the lamp a trifle, secured the flapping bamboo shades against gusts and night insects, and

went out to seek her father to bid him good-night.

A soft but mighty wind was blowing under the bright stars that sparkled in the dark, cloudless heavens as if a snapping frost cleared the air. A November night to look at—the blanched crispness on the blasted grass, the sharp dartle of the stars—but the gale blew out of the warm southwest. Dolly took it full on her bare throat and welcomed it, and lifted her arms to feel it stroke them where her thin sleeves slipped back. Behind her a great, co-radiant light spread upward from the bluffs, announcing the majesty of the moon. All the way she went, along the pallid drifts of sand, to find her father. He might, and generally did, accept her good-night kiss mechanically, but he would miss it, she knew, should it fail to come. She found him in a little cove, where the shrunken brook came down over the stones with a monotonous, vapid murmur. He lay in a trough of the sand, listening to the mingled tale of waters, "like a sick man counting his own pulse," thought Dolly; and as she looked she felt a very mother to him.

"Good night, papa dear," she chanted, while yet she was a little way off; she knew he never liked to be surprised in his silent fits. Instead of answering, he sat up, opened one wing of his sand-cloak, and signed to her to sit beside him.

"What is Alan's business down the trail this time of night?" he asked her.

"He went with the newspapers for the men. I forgot to give them to Margaret."

"Is there any need of his staying so?"

"Oh, they just delight to have him; and it's Saturday night."

"He's keeping them out of their beds. But how should he know, that never did a day's work in his life, when bedtime comes to a man who's been up since five?"

"It's not quite altogether Alan's fault, is it, papa, that he has not enough to do?" Dolly offered.

Dunsmuir kicked the plaid from his feet.

"Not enough to do? Where are his books? He has enough to do there, I think. But no; the book of the range is Alan's study, with a cowboy for his tutor. He'd sooner be able to pick up his hat from the ground at a gallop, than take a stool in the first engineering house in London."

"I did not know there was any such place waiting for him," said Dolly, with deep simplicity.

"And if there was he is not fit for it. Let him first do well, or fairly well, at home. Where's the responsibility he has been tried with that he has n't refused, from fetching the wood for my office-fire, which he never did faithfully for one week at a time! No, I will not take shame to

myself; child or parent, each must 'dree his ain weird.' The cañon has not hurt my girl."

Dunsmuir drew his daughter to him with an absent-minded caress. His loquacity sat strangely on him, for as a rule he was a silent man in his thoughts. She shrank from being a party to this discussion of her brother's faults, and after a little she ventured to change the subject.

"What does Margaret mean when she talks of your saving their homestead? How saved it?"

"I never saved their land. Good faith! It's little they've ever saved through me."

"Well, you did something. It was something about taxes, by Margaret's way of it."

"Taxes, to be sure. Why, Job missed his reckoning, somehow, and the taxes went by default. They've a curious, inconsequent way, here, of collecting them. The claim was advertised in process of law, but Job did not see the newspaper. I happened by as the land was being cried at the court-house steps, and paid the tax, as any man would. They could have redeemed it afterward, had they been posted on the law; and I should have seen to that. Margaret's gratitude is the simplest thing about her."

"It would seem she likes to think you saved it; she has it over and over. Latterly she is always harping."

"And do you know why? To spare your pride, should you come to know they are trusting me for the best part of their wages, since wo years. I have paid them as I could, a little from time to time to keep the pot boiling, and they have scraped a little off their ranch, one way and another. But there's where it is; Margaret will not have us beholden, so she makes out there's a debt on their side to offset what we owe them."

"It need not hurt you to know it now," Dunsmuir added gently, seeing that Dolly was more troubled even than she was touched by the ingenuity of Margaret's devotion. "These sore matters will soon be straightened. We'll get our pay before long. It's a pity, though, since you speak of land, that Job took up his desert section four years ago this summer, when, as I thought, the scheme was ripe. The land is forfeit now; nobody has touched it but it will be covered with filings as soon as word gets out the canal is to go through. It is by my advice he used his right. It is a fortune lost. And I dare say they never speak of it, even to each other. They're honest, thrifty folk. I'd like to see them get the worth of their waiting. But what comes to me comes to all."

Dolly listened, but without the expected enthusiasm. She had heard such prophecies be-

fore. About every third year, as far back as her young remembrance went, the scheme had culminated, and always at this season, which was also the anniversary of the family's greatest sorrow. Dunsmuir's hopes had risen with the floods and waned as the river sank in its bed. The strain of these summers had been followed by dumb, dogged winters spent between the study and the "quarter-deck," as the children called the long, windy portico facing the river, where their father walked out his moods alone. Every day he would tramp down to the cabin to "count the force," as he said; "the force" consisting of Job and three men more. By spring he would come out of himself, white and worn; sort his garden-seeds, trim his rosebushes, and drive a little harder with the lessons, a sign by which the children knew when there was an inward rising to be quelled. Debarred of his own work the man loved to see things move where he had power to make them. It was fortunate for Dolly that Alan balked at his lessons; she would have gone far beyond her strength to please her father; but she hung back not to exhibit too great a distance between Alan and herself. When it was dead low water with Dunsmuir's hopes there was never a word said about the scheme, and Margaret was as tender to him as to a sick man under the doctor's sentence.

"At last!" he breathed, with the sigh of one who feels the screws relax. He turned his face toward the notch in the cañon wall, where the light of the west looked in:

"Yes; hope may with my strong desire keep pace,  
And I be undeluded, unbetrayed."

"I dread to hear you speak it," pleaded Dolly. "If the door is open at last, let us creep through softly, and not boast we are free. I am afraid—"

Her father turned to look at her. "Ah!" she cried, "listen to that!"

The climbing waters broke with a crash on the bar; the current, racing down, hurled them bodily through the sounding strait. Out of the darkness and clamor came a small, cold, mocking laugh, distinctly syllabled, but repeated on one note devoid of human expression. It was like a cold touch laid upon the spine.

"Come, come, you hear the water clapping in the breach. You'll hear it any night when the river is up, and the wind carries this way. Do you think it is the kelpie? We are after none of her secrets."

"But I hate it. Whatever it is, I wish it would hush."

"We will cry it hush, come high water another year. When the rife river heads into a lake, and leans its breast against the scarp of

the dam, you will hear no more of the water's gecking. The kelpie 'll be closed out, and so will the wearifu' crew of cacklers that cry 'Crank!' and 'Dreamer!' when a man is doing his best, and mostly failing at it. There, we will not speak of it. The worst of a long, slow fight is the bitterness it breeds."

His thoughts must have crowded hard upon him, for he checked himself, like one who feels that he has spoken overmuch. He took his daughter's hand and passed it gently over his face; from the steep forehead over the bony brow and sunken eyelid, down the cheek and over his mouth, breathing its softness as one inhales the cool virtue of a rose.

Tears gathered in Dolly's eyes. She made no secret of wiping them away. She loosened the beads that clung to her warm neck and choked her.

"Why do you cry, Dolly? I should be glad to see you take good news more simply. It comes late for some of us, but not for you and Alan. Can you not believe it?"

"I believe it, father, but I do not see it nor feel it yet."

"That is quite natural. Well, shall we go up now? See, the moon has swung out like a great ship from port; her course lies clear before her. God knows I am thankful this work is to be finished. I have been cruelly hampered in it."

"I knew it was for the work," said Dolly, proudly. "Some have said it was for a great fortune you have stayed here so long."

"Eh, you think your father should be above such toys as fortune-seeking? Well, there you are grandly mistaken. I am no philanthropist, and I am a man that needs money. But what matters a reason here or there?—romance it as you will. The man himself is his own best reason for what he does; and when the thing succeeds, all can see why he was bent on doing it."

"And if it fail?"

"There is no such word, my dear. Good work can wait; it never fails."

Dolly sighed tremulously. "I wish you *would* tell me why you have waited all these years. It could not have been just for money."

"Why have I waited?" he mused, with head erect and dreamy eye. "He that sees us as we are, our prideful mistakes and pitiful victories, kens why, and at what cost."

"May I ask you just this?" the girl persisted; "would you have kept on just the same had you known—"

"Ask me nothing! I gave up thinking years ago. I put my hand to the plow; the share cut deep, the furrow was long, and we are nearing the end of it. May God prosper the harvest!"

He took her by the shoulders, and shook

her, and kissed her hard. Dolly laughed, with the tears in her eyes. They went up the hill together, she with her arm under her father's, trying to keep step with his long, unheeding stride. On the crest the wind caught them. Dunsmuir opened his plaid and folded Dolly in it; the rowdy blast strained it tight. At the study door he took her by the pinioned arms and lifted her over the sill, setting her down again with a mighty hug. He was gay as a boy. Dolly trembled for him, he seemed so exaltedly, perilously secure.

"Well, what is it?" he asked presently, seeing that she hung about his room, looking as if she had something still on her mind. "As well out with it now as any time."

"Would you mind showing me the letter? I 'd like so much to see the very words."

Dunsmuir smiled in the negative. "I have no right to show you a letter which relates to other people's business," he said. "And you would not understand the half of it. One thing I may tell you; there will be no expert examination of the scheme. They have looked up my record, and are satisfied that I am competent to pronounce on it, and that nothing will be misrepresented."

"You will like to work for those people!" said Dolly, beaming. "And has no one ever come to look at the scheme?"

"Several people; before you could remember, perhaps."

"Why was it nothing came of those visits?"

"O ye of little faith! Generally speaking, a sinister little cloud has appeared, no bigger than a man's hand, the hand of Price Norrisson—may the Lord find better work for him than meddling with me! I have said I would never forgive him till he stood out of my sunlight. But these are not matters for you to take to bed with you. Remember, there comes a time when the best word is the word to hold by."

Between happiness and doubt Dolly lay awake long, and heard Alan's feet, about eleven o'clock, pounding on the sod past her bedroom window. At the same moment, from over the gulch, came Modoc's short, excited neigh—his call to Alan when his blood was up. It was not likely that Alan had been all this while at the cabin, thought Dolly; the conviction startled her that he had been racing over the hills on Modoc, reckless of his father's express conditions. Alan tried one and another of the rear doors; all were closed for the night. He then went around the house, quietly, to the front door; Dolly heard her father's voice in sharp tones of challenge and inquiry, followed by Alan's low, sullen replies.

She sat up in bed and rocked herself to and fro, in misery for them both.

## V.

## A CONFLICT OF SCHOOLS.

A TELEGRAM from Mr. Norrisson, awaiting Philip on his return from the cañon, announced the manager's return by train that night, bringing guests for whom rooms were to be prepared. The prompt wording of the despatch was like the click of a latch-key preceding his father's stamp in the hall. In his sleep that night he felt the hot breath of the cañon wind again upon his sunburned face. He sighed and tossed, and presently he was forcing his horse up those tottering rock-slides, slipping and falling, with a din of waters in his ears. Again it was along the brink of the bluffs he picked his way, and woke with a strong start as the footing dropped off and left him facing an abyss, the booming of the river confusing his senses. Later in the night he labored through a conversation with Alan that he felt to be critical, yet in which he was singularly helpless to say the right word. He attempted a comparative analysis of the genius of their respective fathers; he gave Alan good advice, and promised to assist him in his studies; to all of which Dolly seemed to listen, with sweet eyes of approval lingering upon him.

Great was Philip's relief, on waking, to find that none of these utterances were actually on record against him; yet he was loath to part with those tender dream-glances which the unconscious Dolly had given him, in the lawless travesty of sleep.

The air had changed to the chill of early morning. Carriages were rolling through the streets; one stopped, and Philip heard hushed sounds of an arrival in some distant part of the house. It was after this that he fell into his first deep slumber, which held him long past the breakfast hour. He was introduced to his father's guests only as the carriage drove up to make the party, including Mr. Norrisson, away; where, or for how long, Philip was not informed.

"Does my father give a dinner to-night?" he asked, chancing toward evening to pass through the dining-room, where Wong, in full starched panoply, was laying the table for six.

"Little dinner. Not muchee people. Two only."

"What time dinner?"

"Same time. Ha' pa' six."

"You will take in Miss Summercamp," Mr. Norrisson posted Philip, in the library, where they met before dinner. "She is a very pretty girl, though, I suspect, a trifle spoiled. The Summercamps have had hard luck with their children — this is the last one of five, and it's a pity, for there is plenty of money."

"Have I heard you speak of the Summercamps before?"

"Possibly not. The ladies came in with us

last night; they are stopping at the Transcontinental. Summercamp wants to go in on the new scheme, and his wife and daughter will take up a desert section apiece."

"Under Dunsmuir's ditch?" Philip inquired, surprised at the progress affairs were making.

"Under *our* ditch. We shall have the contractors here next week, or week after, to look over the work. The estimates must be ready for them. I must have a talk with you about that."

"And how have you managed with Dunsmuir?"

"Have n't approached him yet, directly. Our man in London has seen the people Dunsmuir has been working with. He had got things in very good shape; but our man put them on to the situation here, and they have concluded they don't want to buy a fight. It is the game we have worked before; but Dunsmuir has never before been so near the close of a bargain. It will cinch him, I expect. These men are his own crowd. He will never get a better hearing, and he knows it. When he's had time to think over their alternative, we will step in with an offer which he'll be forced to take. He has banked on this scheme about as long as he can. There's nothing left but the personal pull on men that he has n't paid; and, if I'm not mistaken, Dunsmuir's too proud a man to try to make that go."

Messrs. Leete and Maynard entered the room, and Philip heard no more at the time of his father's strategy.

The ladies were unfeignedly late. They had spent half an hour, they said, beating the dust from their traveling-dresses, to make themselves tolerably fit for a dinner-table. Both, in a breath, began praising the house — "Such a lovely house to be wasted on a couple of men!"

"Planned and built and furnished by men, Mrs. Summercamp," Mr. Norrisson retorted.

"Ah, but when you plan and build and furnish for yourselves, do you do it like this? You need not tell me there is no Mrs. Norrisson!"

Mrs. Summercamp approached her host on his domestic side with the fearlessness of a woman happy in her own relations.

"I hear there is a very charming Mrs. Norrisson," Mr. Maynard interposed, with flattering emphasis.

"There is," said that lady's husband, imperturbably; "but she looks upon this house as a sort of caravansary for the convenience of first-class tourists, like yourselves. It's rather too far inland to suit her."

"But she comes sometimes?"

"Well — she is waiting till we get rid of the smoke of the sage-brush bonfires."

"Why, I don't think it is at all noticeable,"

said Mrs. Summercamp, amiably surprised at this novel objection to the country. "Is it considered unhealthy?" There was a general laugh, and Mr. Norrisson admitted that he had been somewhat figurative in his reference to the virgin crop of the desert.

The dinner went forward as the dinners of a man of experience do. It was a trifle too elaborate, perhaps, but it suited the house and the host, and the ladies frankly enjoyed the display in their honor. The men discussed locations for water-power on the line of the new canal, probable town-sites and railroad-stations, and joked the ladies about their artless behavior in the land office, when asked to declare their intentions as desert settlers. The four travelers appeared to be old friends and to know one another's plans. There were frequent references to Mr. Summercamp as "papa," in a style of easy comradeship, and Miss Summercamp openly geyed her mother with fond impertinence, as if they were girls of one age. She was a pretty little coquette, with large eyes, deceptively solemn. She looked scarcely more than sixteen, whereas in the land office she had calmly sworn to twenty-five.

"I hope we shall have a nice day to-morrow for our picnic," she remarked to Philip.

He inquired, with polite interest, where the picnic was to be.

"Now, Mr. Norrisson," exclaimed Miss Summercamp, turning from Philip to his father, "what sort of an arrangement is this you have been putting up on us? Here is your son perfectly unconscious there 's to be a picnic, still less that he 's expected to take care of us, and show us the way!"

"My dear young lady, my son was not on hand this morning in time to go with us to look at the lands; and so he was n't aware there were any charming desert settlers in the party, and could n't offer his own services; so I did what I hold to be a father's duty—put in his bid for him. Was n't that right? I 'll own it was bad of me to forget to tell him this evening before you arrived; but in the matter of the invitation my conscience is clear. Consider how seldom such chances occur! Is a poor young fellow to be knocked out because he happens to oversleep himself? Not while he has a father to look out for him."

"Well, I consider the whole business canceled from this moment," cried Miss Summercamp. "I don't accept invitations by proxy."

"As a trifling matter of fact, Estelle, it was your mother who accepted," suggested quiet Mr. Leete.

"Well, mama may go if she chooses, but she will have to leave her daughter behind. Mr. Norrisson has trifled with my vanity in a way that can't be overlooked."

Philip submitted, with all due gratitude to his father, that his own vanity was in a more trampled condition than even Miss Summercamp's; and proposed the picnic should start afresh, with invitations at first hand.

"Now you 're talkin'," said the young lady, lightly, dropping into slang; "but remember the place must be the same. I don't know that anybody has mentioned that we are going to a place in a cañon called Dunsmuir's Location."

Nobody had, and Philip, taken by surprise, could not at once conceal his consternation; the cañon being the last place where he would have chosen to exhibit himself as Miss Summercamp's vassal, even of a summer's day. The idea struck him as a sort of comical profanation. "Behold the victim writhe," said she. "He can't hide his sufferings now the thing begins to look as if there was no getting out of it."

Neither could the young lady altogether hide the note of vexation in her voice. Her mother looked uncomfortable; and Mr. Norrisson tactfully turned to her with some commonplace about the next day's arrangements, taking it for granted that all was going forward as before.

Miss Summercamp quickly recovered herself, and graciously accepted Philip's offer to go with the party in the impersonal character of driver, since she would put no faith in his professions as a cavalier. The ladies took an early leave, escorted by their friends, who had telegrams to send out that night. The father and son were alone in the library, smoking their bedtime cigars.

"You must be tired," said Philip, observing the change in his father's features, from which the society smile had vanished, as a frugal host puts out the extra lights when the hall door closes upon company.

Mr. Norrisson passed over the remark with the abrupt question: "You were up the river yesterday, I hear, to look at the location?"

"I saw it, from a distance."

"It shows what it is—a natural dam-site, rock bottom and all."

"Is it known whether the rock bottom is continuous?" asked Philip. "There is one spot, in the middle, where the water boils up in a curious way. How does it look when the river is low?"

"The river is never so low over that spot, nor so quiet, that you can see what the channel bed is made of. Dunsmuir was never satisfied on that point. There was another—the capacity of the waste-weir. In every other particular his design for the head-works was complete. I have copies of his plans and drawings for the works. I wish you would look them over now, pretty soon, and, if you like his design, carry it out; and I 'll give you help about

working up the specifications. Or, if you can improve on it, why, of course, we want the latest advices. Engineering must have advanced some since Dunsmuir laid out his scheme."

"Do you mean, sir," asked Philip, in sheer amazement, "that you expect me to take charge of the building of the head-works in the cañon?"

"Certainly. What did you suppose I brought you over here for? To carry a chain?"

"But that is work for an engineer-in-chief of the first class; and I should not rank, on the government corps, above the grade of *ingénieur ordinaire*!"

"You are not working for the French government; you are working for me. You will have my advice in practice, and my knowledge of organization to help you, and I shall give you as good a consulting engineer as the country affords. I must have an engineer who will push things as I want him to — no buts, and ifs, and cheeky conditions. The conditions of this scheme nobody is going to dictate but myself. They are matters of finance first, and engineering afterward."

Philip was aware from a certain violence of manner that his father was arguing on a sore point, one on which he had learned to expect opposition. He got up from the table, where he felt cramped under observation, and went over to the fireplace. It was decorated with a mass of yellow and white azaleas in a blue Leeds pot, within the tiled jambs; the whole darkly reflected in the black marble hearth-slab. Philip stooped and picked up a petal that had fallen, rolling it in his cold fingers as he talked.

"I should have supposed that Dunsmuir would build the head-works. No one could carry out his plans so well as himself; and by this time he must have the facts he needed: he must have tabulated the river's rise and fall for every season he has watched it, and sounded every inch of the bottom. Those two points you speak of are the vital points in construction, I need not remind you. If time is an object, Dunsmuir has had plenty of it. No one, not the best man in the profession, could come in here and decide those two points off-hand."

"We need not discuss Dunsmuir's place on the work, my son. He is not going on it at all in a position of authority. That shall be my first condition when we come to terms on the compromise. I can't work with Dunsmuir. I could n't when he was fifteen years younger and suppler than he is now. If you are in charge expect you will defer on practical questions to the manager, and on technical ones the manager will defer to you; but the practical questions shall come first."

"I should call the size of the waste-weir, in country without records of rainfall, a practi-

cal question of the first magnitude in the building of a dam."

"There *are* records — just as good as public records; only Dunsmuir would never take any man's word for a fact unless he knew him to be a trained specialist in that particular line of observation. I can find plenty of old miners and log-drivers up and down this river who can give you the average flood-discharge of the Wallula for the last twenty-five years just as close as you could come to it with your scientific apparatus. Talk of training! Have n't they got eyes and ears — those fellows, trained like the beavers and the muskrats? Don't they stay on top of the earth by using the faculties nature gave them? When *they* make a mistake the penalty is death."

"Still, as a matter of experience," said Philip, pleased but not moved by his father's rhetoric, "testimony of that sort has not always been found trustworthy."

"Always, no; no testimony is always trustworthy."

"I find here among your blue-books a case in point, the chief engineer's report on the breaking of the Kali Nadi aqueduct — a most pathetic, manly document. He had no data on which to base his calculations but hearsay and the look of things; the records had been destroyed in the last Indian mutiny. And he made a mistake which cost the Government an unmentionable sum of money, and to a man of his reputation must have been worse than death."

"My dear boy, the Kali Nadi aqueduct be hanged! If we listened to all those tales of heroic failures, and counted the cost of them as so much likely to come out of our own pockets, there would n't be any need of ditches. The men who settled up this country did n't wait to hear about the failures; they went ahead, somehow, and did what they had to do. Our conditions here are no more mysterious than in hundreds of places in the West where big works have gone through — without records, without time to hunt up even such testimony as you despise — simply because they had to. The people could n't wait for a sure thing. Some of them were failures, but more of 'em have stood. I am not taking any serious chances on this scheme, mind you, though I have taken my share of chances, and maybe I've had more than my share of luck. I know what I'm offering you, and I am sorry you have n't the nerve to make the venture. I suppose it's the aim of your schools to lower a man's conceit of himself, but the modest layout can be overdone. I am not asking you, now, how little you know about engineering."

Philip looked down and trifled with the loop of his watch-guard. "Every one must work in

his own way," he said. "I am not prepared, myself, to take the plunge in the dark which seems to be called for here. Modesty is perhaps too charitable a name for it."

"Is it partly some scruple about Dunsmuir?" Mr. Norrisson asked. Philip did not reply.

"You are too fine-spun," said his father, observing him; "but I don't blame you. The school is everything."

"I am sorry you don't like my school."

"I do like it. It is a school I could never afford to work in myself, but if my son can, why, so much has been done for the improvement of the race."

"I hope you will believe how it pains me to disappoint you, sir. I hoped to show myself equal to whatever work you intended me for; but I had n't an idea so much would be expected."

"You are wrong, Philip — thinking I expect so much; I don't place this responsibility upon you alone. Don't you understand I intend to back you, straight through, with my experience? It looks to me more like distrust of your father than of yourself, this bashfulness of yours."

It was a difficult position for Philip; but he thought it altogether due his father that he should be answered with plainness equal to his own.

"Frankly," he said, "I should prefer to make my maiden venture under a professional engineer; but a chief's place I could not take under any man. I had rather work up to it, and hold it alone. Between Dunsmuir's design and my father's experience I should be a poor figure of a chief."

"I concluded there was pride, as well as modesty, at the bottom of it. The young West-erner is a more conservative man than his father, more careful of himself in every way. He can afford to pick his steps and take his time; but, by the Lord, he owes it to his father that he can."

Philip responded with such heartiness as the conversation had left him master of. He was a prouder man than his father, although his training had made him less self-confident. It was bitter to be judged by standards for which he had not been taught the highest respect; and the fact that his father was such a power in practical affairs, had done so much where he had done nothing, made his refusal to coöperate with him seem an exhibition of stupid, irrational, boyish conceit. They shook hands for the night earnestly, dissembling the slight chill of estrangement which both felt. Each had begun to analyze the other, comforting himself for the sense of mutual unlikeness, on the old theory of types inseparable from the generation which has produced them.

"My father is a man of resources, of practical foresight, of courage in combination; in a word, a born promoter," Philip asserted, in answer to the sad whisper which said, "You can never trust him as a counselor, nor yield him unquestioning obedience as a chief."

Mr. Norrisson put away from him, as he had done many another bitterness, the discovery that his son was a man of the Dunsmuir type, a stubborn, fastidious "obstructionist," a stickler for impossible ideals. But he never allowed himself to dwell upon a disappointment; it tended to weaken that nerve upon which he depended, as a professional man depends upon conviction, and the soundness of his method.

## VI.

## CAPITALISTS IN THE CAÑON.

THE effect of the cañon upon Miss Summercamp was to rouse in her a vivid and very practical curiosity as to the resident family; a phase of liveliness which her mother was too indolent or too indulgent to attempt to check, although it might have been seen to annoy their young host in his unsought part of showman. Miss Summercamp had caught sight of Alan picturesquely engaged in fishing from the rocks, a boyish pretense for the sake of seeing and being seen of a very striking young lady visitor, strolling with her friends on the sands below. As the group drew near, he recognized Philip, and snatched off his cap in greeting; but Philip managed to get his party headed another way. Miss Summercamp perceived that he was bent on frustrating her whenever she manoeuvred for a nearer view of the inmates of that queer, low house on the hill, the "asylum," she named it, "for victims of a scheme." Partly for teasing, and more because she resented his indifference to her pleasure, she set herself to gain her end in spite of him. She had heard, she said, that the Dunsmuir's were all cranks. The young man in the pink shirt did not look a crank; he was merely a beauty. Why could n't they ask him to show them that much-talked-of spot called "Dunsmuir's Location"? It was pointed out straight beyond her, but she could see nothing but two low, black buttes seated on opposite shores of the river. Still, it was interesting to know that a dam was "going in" there, and that water for her desert claim would eventually flow through the big cut, where they had lunched after the manner of picnickers, though without the festal paper-bag or beer-bottle left behind in token of their visit. Philip had been respectful to the place, nor did he vauntingly prophesy concerning the future canal; this he left to Messrs. Leete and Maynard, who had been posted by his father.

Miss Summercamp declined to drink the

warmish river-water; she would not accept any of the substitutes provided; apollinaris, claret, ginger-ale, she would none of them. Philip offered to fetch her some of the creek-water which came down the gulch above the house, and it pleased the young lady to go with him. The favor of her company he could not refuse, although he imagined she had an ulterior purpose in offering it. After a hot walk they rounded the wire fence, and came upon a clear pool some distance above Dunsmuir's boundaries. But this water, also, she refused to drink. It was tepid; it tasted of cattle; the pool was lined with decayed leaves.

"How very squeamish you seem to be about those people; one would think you were here to look out for them instead of us," she complained. "Are they really so peculiar that one may not ask for a glass of ice-water at the door?"

"I will ask for one, certainly. This is the first time you have mentioned ice-water."

"Are you going to leave me here to be hooked to death by wild cattle?"

"There is not a pair of horns in sight."

"A hundred will rise up the moment you get on the other side the fence. I declare, you treat me exactly as a bad brother treats a helpless little sister. I've a great mind to be one, and just tag you wherever you go."

"Very well," said Philip; "stick to your part, and I'll try to do justice to mine."

"But goodness! I cannot go as fast as that," she called after him, as he strode down the gulch.

"Bad brothers never wait for little sisters who tag," Philip answered. Nevertheless he did wait, and with gibes and laughter, and some ill humor on Philip's side, they arrived at length at a small gate in the fence, close to a circle of poplars which guarded some invisible retreat.

"Now," said Philip, opening the gate, "it will be perfectly safe for you to proceed. One is quite enough to ask for that glass of water, and bad brothers never wait upon their sisters if they can help it."

"You overdo the part," Miss Summercamp objected; "brothers are never so consistently bad."

"You have dubbed me; I am merely the creature of your fancy."

Miss Summercamp went through the gate alone, leaving it open, however, on the chance of Philip's changing his mind. He did so, after a little, not knowing how far her freak might carry her. The gate of the cañon garden led to the poplar alley, at the upper end of which the explorers had come out. Dunsmuir had modeled this feature of his plantation after the lady's walk at a small hacienda where he had

once spent a night on one of his southern journeys. This was before he had a lady of his own, but not before he had dreams wherewith to people such a moonlighted vista as that which he paced, alone, under the black-ash trees of Mexico *templada*. He had been forced to substitute poplars for his lady of the north; otherwise he had faithfully copied the little deserted *calzada*, even to the *glorieta* at the top of it, where the trees, opening in a circle, inclosed two stone benches that faced each other, in an appealing silence and emptiness, on opposite sides of a dry fountain. As if invoked by the spell of that resemblance he had fondly sought, silence had taken possession, and the stone benches held only drifts of yellow leaves.

When Dolly Dunsmuir first set up house-keeping with her dolls in the cañon arbor, and Alan occasionally consented to visit her, the sunken tank of the fountain was filled with dead leaves, and the white-painted urn was dingy and choked with dust. The following spring saw both children busy filling up the tank with earth, and planting it with such hardy perennials as they could beg from their father's beds. These, coming up in due time, brimmed the useless basin with life and color, while the urn overflowed with garlands of white and purple clematis. When Dunsmuir saw what the children were doing, he surreptitiously added to their humble collection a regal *Lilium Auratum* for his girl-gardener, and a "giant of battles" rose for the boy. Before many seasons both rose and lily were left to Dolly's tending. Alan had stepped forth into his bold teens, and took no more interest in gardening. He had fitted up a bower of his own,—the cave underneath the bluffs,—whence he could look afar and downward, and spy the cattle on the hills, and hoot and howl to his heart's content. But Dolly remained faithful to the place of their childish trysts. It was her out-door chamber of dreams, where she sat and mused with idle hands and bright, unseeing eyes. When the dream grew too strong, and pushed her hard, she would walk round and round, like a somnambulist, her face alight, her lips moving. What she whispered at such moments she would have died, girlishly speaking, sooner than have confessed. There was little heart in these dreams and not much real imagination; only the young instinct to people empty walls with pictures of action: and Dolly's fancy was limited by the material her narrow life and her reading supplied. The cañon could not make a genius of Dolly, neither could it spoil her for a happy woman.

The morning of the picnic being a Saturday, she had given her beautiful long hair its weekly washing, and now she had retired to the arbor, with a lapful of mending to employ the

time while her damp mane was drying. She had tucked up one slippered foot under her, the stone benches being high; her hair, which had recovered its natural color, with an added luster from the bath, began to creep and curl in the dry, electric air. She was pinning it back with a long, crooked shell pin, when she first became aware of voices and footsteps, not usual in that place or at that hour. She sat perfectly still, trying to catch their direction.

"Do come here, bad brother, if you want to see the Lady of Shalott."

Miss Summencamp had caught at the first fancy that crossed her to characterize the figure of Dolly sitting alone in the green light of the arbor, her face half-hidden in her spreading hair. There came no answer to this invitation; but as the voices and footsteps continued to hover distinctly about the place, Dolly gathered her work, flaming with indignation, and left the arbor. Never before had the mob been so bold.

Part way down the poplar walk she ran almost into the arms of Miss Summencamp, who with Philip behind her had just pushed between the tree-boles. The two girls sprang apart and stared at each other; Dolly, helpless with anger and conscious of her Ophelia-like locks, facing an alert, smiling little person, in a sailor hat and a smart mountain frock of colors as bright as a kingfisher's.

"Oh, excuse me!" Miss Summencamp began. "Would you be so good—"

But Dolly interrupted haughtily. "If you are wanting anything please ask at the house. We don't receive strangers by the cow-gate." With one glance at Philip from her gray eyes, now black with anger, she hurried past them, taking a near cut through the trees to spare herself the sense of being watched.

"Did you ever!" Miss Summencamp exclaimed. "Whyshe popped off just like an electric light when you jerk the chain. It reminds me of the way the creatures answer in 'Alice in Wonderland.' Would they throw things at us, do you suppose, if we knocked at the front door?"

THAT evening Philip was in such low spirits that his father remarked it, and asked if he felt unwell.

"I am afraid you are fretting over your decision of last night," said Mr. Norrisson. "It need not rest a feather's weight upon you. I may have taken a little pride thinking we could patch up a team, you and I, and see this work through; but let it go! There is always more than one way of doing a thing. I expect you'd like to get to work. Tell me what you feel yourself able for, and I will put you in the way of it."

"Yes; I think I had better go to work," Philip assented.

"Well, the fact is there is nothing out here for an intelligent man to do but work. We all work too hard just because we get bilious and are bored to death if we don't."

The consultation ended in Philip's being given charge of a reconnoissance for selecting reservoir-sites in the hill country above the cañon, with orders to meet his men at a stage station on the nearest divide, called the "Summit." Mr. Norrisson gave his son a horse, a Winchester rifle, and bade him go buy himself some dark flannel shirts, a broad-brimmed hat, and a pair of camp blankets. With this equipment Philip took the box-seat of the stage one dazzling, breezeless morning, and turned his face joyously to the hills. The old immigrant trail, now the stage-road to Idaho City and the mining region beyond, makes a long detour, after leaving the valley, to avoid the bluffs, and gains a fording-place some distance above the cañon. Every few miles there is a wayside post-office for the convenience of camps or outlying ranches. Philip made sketches in his notebook of one or two of these post-boxes, nailed to trunks of trees or propped upon posts within reach of Mosely, the stage-driver's hand. They were empty candle-boxes, or other chance receptacles, with the proprietor's name rudely lettered on one end; and all were open as birds' nests to the curiosity of a wayfaring public. In one that they passed, which bore the name of Joe Mutter, a druggist's parcel was left, a soup bone, a crumpled letter, and a loose brown paper bundle exposing a pair of woman's shoes sent to town for "two bits" worth of cobbling.

"They've got a sick baby at Mutter's," the driver remarked. "There comes the old woman now, on the lope, after that bottle of doctor's stuff."

Philip was drowsing along, his hat pulled over his eyes, when Mosely began rummaging in the boot again after the mail "for the cañon folks." Philip straightened up, and saw that they were at the foot of a long hill, the black crests of the lava bluffs out-cropping to the right, to the left only the swell of grassy slopes cutting off the sky.

On his own side of the road, not two rods away, sat Dolly on Alan's pony, waiting for the stage.

"Ain't that just like a woman?" Mosely chuckled. "Can't never remember which side the driver sets on. Now you'll have to hand her this newspaper truck."

"Where is their post-box?" Philip inquired.

"Don't have any. The old man don't like his letters and things hung out where everybody can handle 'em."

"Could n't they have a lock-box?"

"Well, when folks are so particular as that,

DRAWN BY MARY HALLOCK FOOTE.

ENGRAVED BY CHARLES STATE.

"SHE WENT ALL THE WAY ALONG THE BEACH TO FIND HER FATHER."

the best way is to come themselves. I can't set here and lock up people's boxes. Anything I can chuck in without gittin' down I don't mind botherin' with."

Mosely drew up the horses, and clapped down the brake. Dolly forced the pony close to the fore wheel and held up a leather satchel for the mail which Philip had in charge. She saw too late how stupidly she had placed herself on the wrong side, as if with intention, and gave him but a cold recognition. He accepted it as his meed for complicity in the Summercamp invasion. Meantime, the young people had bungled the mail business, so that a letter bearing a London postmark fell in the dust between them.

"Dear me, that 's an important one," thought Dolly, as she jumped from her saddle. Philip had his foot upon the wheel. "I 'll catch you up at the toll-gate," he said to Mosely, who nodded and drove on.

Dolly, though she was down first, allowed Philip to hand her the letter, not to cheat him of his thanks. He fastened the post-bag to the saddle, and stood at the pony's head expecting the pleasure of putting her on. But the wise lassie had no mind to attempt this delicate manœuvre, for the first time in her life, with a stranger's assistance.

"Oh, thanks, I 'm used to getting on by myself," she intimated cheerfully, as one who knows what she is about. She gathered the reins and placed her hands for a spring, while Philip stood aside to see her go up. But something happened: Modoc did something at the critical moment not in the program, and instead of finding herself where she had expected to be, Dolly was hopping through the dust on one foot, clinging with both hands to the saddle, and Modoc was steadily backing away from her. A very little of this sort of exercise suffices a proud girl on a warm day, with a sophisticated-looking stranger for spectator. When Dolly had got both feet once more upon the ground,

she hauled Modoc around with a vicious pull, and stood against his shoulder, trembling with a mixture of excitements, but ready now for assistance—not that she could not have mastered the pony easily had she been alone.

"He is acting in my interest," said Philip, coming up and making Modoc's acquaintance with a horseman's touch. "Shall we try it now?" He dropped into the proper attitude, and offered his right hand; it had a new, light-colored seal-leather glove upon it. But now Dolly hung back, blushing and weak with the ordeal before her. Philip might have given a hundred guesses; he could never have come near the cause of her sudden misery. She had put on that morning her worst shoes,—her tan buskins, of all things, for riding,—and had hurried away without changing them; they were scoured by the rocks, and whitened by alkali dust. How could she place a foot so disgracefully shod into the faultless hand held out to receive it with that particular air of homage so new and confusing? The contrast was too much! It took away all Dolly's nerve for the critical attempt, and though she knew quite well in theory what was to be done, the affair went off badly. Indeed, without going into details, it could hardly have been worse, from a bashful novice's point of view.

Dolly withdrew her weight from Philip's shoulder. He gave the rein tenderly into her hand, murmuring apologies, he hardly knew for what, unless that he could not feel as unhappy as she looked, nor quite regret her sweet awkwardness. Dolly rode home burning with the resolution to get a quiet hour with Alan behind the corral at once, and to make him teach her the trick of mounting from the ground beyond peradventure of accidents. As for the tan buskins—she put them into the kitchen range before she went to dress for lessons, Margaret protesting there was "wear in them yet," and asking if shoes grew on the bushes, that she could afford to be so reckless.

(To be continued.)

"JACKSON CLEARING HIS KITCHEN."

## EARLY POLITICAL CARICATURE IN AMERICA.

POLITICAL caricature in the United States virtually dates from the first administration of Andrew Jackson. There had been occasional efforts to use caricature as a political weapon previous to that time, but they were too crude in execution, too spasmodic in appearance, and too indefinite in purpose to be taken into consideration in tracing the beginnings of our modern school. The advent in national politics of so robust a personality as General Jackson seems not unnaturally to have stimulated a resort to pictorial means for both assailing and defending him. He had entered the presidency as the savior of his country, a military hero of indomitable valor. His fight against the United States Bank, his vociferous and unceremonious methods of conducting controversies with political opponents, the subversive conduct of his famous "kitchen cabinet," and its dissolution when Van Buren withdrew from it, had combined during his first term to enhance greatly his attractiveness as a popular idol. He appeared before the people as their only champion against the oppressive designs of a huge money monopoly in which the whole world was joined. He was the "People's Friend" in all crises; the giant who, sin-

gle-handed, was fighting their battles against enemies from all quarters. Every conspicuous act of his public life was performed amid uproar and turmoil. Even when his "kitchen cabinet" was dissolved, there was so much dramatic disturbance that one of the political caricatures of the time pictures him, armed with a churn-dasher, clearing the kitchen of all opponents as with the very besom of destruction.

Few of the earlier caricatures are to be found now. They were issued at frequent intervals, mainly in New York city, in lithograph sheets to be nailed upon walls or passed from hand to hand. They were crude in drawing, and sometimes coarse to the point of indecency. They bore evidence that their designers had gone abroad for inspiration, taking their ideas mainly from English caricaturists. In fact our modern school of caricature dates from almost the same time as that of England, and both followed closely after that of Italy, France, and Germany. In all these countries the first political caricatures were lithograph sheets, passed about from hand to hand; usually issued by the artists themselves at first, and subsequently by some publishing house. The founder of the modern school in England was James Gillray,

"A BOSTON NOTION FOR THE WORLD'S FAIR.—A NEW CRADLE OF LIBERTY."

who was born in 1757, a few years before the death of Hogarth. His earlier work, which was mainly social, partook largely of the character-

istics of the caricaturists who had preceded him. It was generally coarse, and it nearly always made its effect by use of exaggeration. In his

LOCO FOCO CANDIDATES TRAVELLING ON THE CANAL SYSTEM.

Casey, Mary, Douglas, Buchanan, Houston, Van Buren.

later years, however, between 1803 and 1811, he turned his attention to political caricature, beginning with Napoleon as a subject, and adopted methods from which the modern school has been developed. It would be more accurate to say that Gillray pointed the way to the founding of the modern school of political caricature, rather than that he was its founder. He never separated himself entirely from the tradition, as old almost as the art of drawing, that coarseness and exaggeration were the essential elements of humor as exhibited in caricature.

The first English artist to make that separation completely was John Doyle, father of Richard Doyle. He began to publish political caricatures in 1830, under the signature of "H. B.," and was the first caricaturist to preserve faithfully in all cases the likenesses of his subjects, and to give to them their individual attitudes and tricks of manner. He was the real founder of the "Punch" cartoon as it has been developed by Richard Doyle, John Leech, and John Tenniel. He preferred to draw single figures, though he sometimes produced groups with several figures, calling his productions "Political Sketches." It is a curious and interesting fact that the United States supplied the inspiration for one of his most successful pictures, and incidentally, perhaps, helped to lay the foundation for the double-page group-cartoon with which we are so familiar to-day. In 1836, Thomas D. Rice, the father of negro minstrelsy in America, went to London to introduce his invention. His "Jim Crow" song proved a great popular hit, and all London went to hear it and then went about singing it.

Doyle, with the quick eye which is the *sine qua non* of the true political caricaturist, drew and issued a large cartoon in which all the leading politicians of the day who had been changing their party affiliations or modifying their views were represented as assembled at a ball, and as being led forward one by one by Rice to be taught to "turn about and wheel about and jump Jim Crow."

The establishment of "Punch" in 1841 put an end to the lithograph sheet caricatures in England. The famous "Punch" cartoonists, Richard Doyle, John Leech, and John Tenniel, followed John Doyle's departure in preserving likenesses, but the double-page cartoon with many figures has been the exception with them rather than the rule. The typical "Punch" car-

toon is about half the size of a central "Puck" or "Judge" cartoon, and is confined to a few figures, frequently to one. While there has been a steady advance in artistic merit since 1841, there has been little change in the general style of political caricature in "Punch."

In the United States the many-figured group-cartoon appears to have been a steady favorite since Jackson's time. Its immediate inspirers were undoubtedly Gillray and John Doyle,

"YOUNG AMERICA."

more especially the latter, whose sketches had been filling the shop-windows of London for two years when similar productions began to appear on this side of the water. Doyle had followed Gillray at a considerable distance, however; for he was a far inferior artist in every way, having slight perception of humor and being hard and inflexible in his methods. What Doyle did was to take Gillray's occasional act of giving a correct likeness, and make it his own permanent practice. His sketches are valuable to-day chiefly for this quality, all his drawings of leading men of the period being veritable portraits of real historical value, some of them the best in existence. Our early American political caricaturists followed Doyle's example as faithfully as their

### THE GREAT PRESIDENTIAL SWEEPSTAKES OF 1856.

Free for all ages, "go as they please"

powers as draftsmen would permit. That they did not succeed very well in the beginning was not strange. Drawing was scarcely taught at all in this country at the time, and the only persons who were skilled in it had drifted here from abroad, and had little knowledge of our politics and public men. It was only in very rare instances, therefore, that a lithograph caricature of an earlier date than 1840 can be found which is even tolerable, either in conception or execution. There was a slight improvement after that period, and by 1850 a sufficient advance had been made to justify the assertion that the foundation of a school of American political caricature had been laid. In 1848 Messrs. Currier

and Ives began, in Nassau street, New York city, the publication of campaign caricatures in lithograph sheets similar to those which had been issued in London and other foreign cities. This was the year of the Taylor-Cass-Van Buren campaign which resulted in Taylor's election. Few of the caricatures of that year are obtainable now, or of those issued by the same firm in the following campaign of 1852. A complete set had been preserved by the publishers, but was stolen during a fire a few years ago.

I am indebted to Mr. James M. Ives, the surviving member of the firm, for much interesting information about the entire series of early caricatures, and for several of the earlier

sketches, including the original drawing of the Jackson kitchen-clearing picture printed at the head of this article. There was a contemporary caricature, now unobtainable, called "Rats Leaving a Falling House," which represented Jackson seated in a kitchen smoking, while five rats, bearing the heads of the members of his cabinet, were scurrying to get out by doors, windows, and other openings. Jackson had planted his foot on the tail of the one which bore Martin Van Buren's head, and was holding him fast. This caricature, as well as its

always his garb in the earlier American caricatures. The World's Fair referred to was that held in New York in 1844. Clay is also the author of the single representative we have of the triangular contest of 1848, when Taylor, Cass, and Van Buren were the presidential candidates. Marcy, the author of the phrase "To the victors belong the spoils," appears in this with a patch on his trousers marked "50 cents," which was an invariable feature of any caricature of him. It was based on a report that he had, while Governor of New York, included in a bill

### THE "MUSTANG" TEAM

companion, "Jackson Clearing his Kitchen," is believed to have been the work of an English artist named E. W. Clay. Both were published in 1831, soon after the dissolution of the "kitchen cabinet." The faces in the kitchen-clearing scene are all portraits: Van Buren, Nicholas Biddle, President of the United States Bank, and Calhoun stand nearest to Jackson; prostrate on the floor is Dixon H. Lewis, whose portly figure was a conspicuous feature of the Washington life of the time; and fleeing from the room with outstretched arms is Francis P. Blair, editor of the Jacksonian organ the "Globe."

An interesting caricature of a decade or so later is that called "A Boston Notion for the World's Fair." This was drawn by Clay, and was aimed at the Abolition movement, which was steadily making headway in Boston under the leadership of Garrison. Uncle Sam appears in this dressed in the style of Franklin, as was

against the State, for traveling expenses, a charge "to patching trousers—50 cents," his reason being that as he had torn the trousers while on business for the State, it was the State's duty to repair the damage. Van Buren is represented as towing the boat "up Salt River" because he was the candidate of a faction which had bolted from the nomination of Cass, and was thus making the latter's election impossible. Marcy appears in the caricature of the Pierce campaign of 1852, on page 221, with his hand covering the patch, he having obviously become weary of allusions to it by this time. In this picture Pierce, of whom a striking likeness is presented, is borne upon the shoulders of William R. King, who was the candidate for vice-president, while Stephen A. Douglas assists Marcy in supporting him.

In their original form, the cartoons here given were about the size of the ordinary

THE RIGHT MAN FOR THE RIGHT PLACE.

European artists abandoned the practice when they began to draw and compose their caricatures so well that they told their own story, with the aid of a title or a few words of dialogue beneath them. The early American caricaturists used the loop as generously as possible, as the specimens of their work given herewith testify. Their publishers found that the public demanded this, and that a picture without the loops would not sell. Yet the pictures told their story perfectly without these aids. In looking over

double-page cartoon in "Puck." With the exception of the two earliest, all of them were published by Currier and Ives. In all of them the faces are carefully drawn portraits, and the figures are presented in natural attitudes. The general style of the pictures is similar to that of the earlier political-caricature period in European countries. The figures are presented almost invariably without background, and each of them is represented as giving utterance to some sentiment which is inclosed in a loop over his head. This use of the loop had been abandoned in nearly or quite all European countries some time before its appearance here. It is to be found in some but not in all of the Gillray caricatures, in some of Doyle's, and very rarely in the earlier numbers of "Punch." The

large collection of them, I did not find one whose meaning was not made obvious by the title beneath it. Take the five relating to the campaign of 1856, for example, and see how plainly their meaning appears at a glance. In "The Great Presidential Sweepstakes" Fillmore is starting well in the lead, because, as the candidate of the American party, he had been the first nominee in the field. Next to him comes Buchanan, borne on the shoulders of Franklin Pierce, whose successor in the presidency he was to be; and bringing up the rear is a cart with Fremont in the driver's seat, Jessie Benton Fremont stowed snugly in behind, Mr. Beecher lifting at the wheel, and Horace Greeley coaxing the sorry-looking horse to pull his burden through the "Abolition cesspool" in which

THE DEMOCRATIC PLATFORM.

the whole party is allowing. "The Mustang Team" tells its story with equal directness. Here we have the three editors, Greeley, Bennett, and Raymond, astride Fremont's sorry nag, while another of the chief editors of the day, General James Watson Webb, is catching on behind. This is the forerunner of the oft-repeated cartoon of the present day, in which the editors of our great journals are frequently made to figure in even less favorable attitudes. The Fremont cart has the same look as in the first picture, with the addition of a bag for the "Bleeding Kansas Fund." It is noticeable that the face of Uncle Sam, who figures as toll-gatherer in this picture and who has changed his costume since the cartoon of 1843, is drawn without the chin-beard which he wears habitually in modern cartoons. In all the pictures of this period he is clean-shaven.

No word is necessary in explanation of the picture in which Farmer Fillmore is about to scatter the rats who are swarming about the "public crib" in the hope of getting possession of its contents. As a prophecy the picture was as bad a failure as its companion,— which represents Fillmore as standing between Fremont and Buchanan keeping them from each other's throats, and as destined presumably to triumph over them at the polls,—for Buchanan was subsequently victorious. The early appearance of the "public crib" as a synonym for the spoils of office is a point of some interest. It was evidently familiar at the time this picture was drawn, and may date back to Jackson's time, possibly far beyond that, coming to us from English usage. "The Democratic Platform" (page 224) gives us a full-length figure of Uncle Sam, without the beard, but with a costume

THE GREAT MATCH AT BALTIMORE, BETWEEN THE ILLINOIS BANTAM AND THE OLD COCK OF THE WHITE HOUSE.

"THE NIGGER" IN THE WOODPILE.

similar to that which is still assigned to him. The three supporters of the platform are Benton, Pierce, and John Van Buren. The latter was known as "Prince John," while his father, the ex-President, was known as the "Old Fox." In the caricature Prince John is talking to his father, who is presented as a fox peering from a hole. This picture, which has obvious points of strength, was a very successful one, and had a large sale.

The seven caricatures relating to the great campaign of 1860 were the most successful of the kind ever issued in this country. Probably the first of the series was that which represents Douglas as the victorious cock in the pit, crow-

AN HEIR TO THE THRONE,  
OR THE NEXT REPUBLICAN CANDIDATE.

ing upon the prostrate form of Buchanan after the Baltimore convention, for Douglas was the first of the four presidential candidates who took the field that year. This is one of the best-drawn and most vigorous pictures in the collection, and compares favorably with the caricatures of the present day. The two pictures in which Lincoln is the chief figure, "The Nigger in the Woodpile" and "An Heir to the Throne," came out soon after his nomination, and the likeness of him which is presented in both of them seems to be based on the photograph which was taken in Chicago in 1857. It is a powerful face, full of the same sad and noble dignity which became more deeply marked upon it in later years,—the face indeed, even then, of the "kindly-earnest, brave, foreseeing man" of Lowell's immortal ode.

The caricaturists of the period were quick to seize upon whatever happened to be uppermost in the public mind at the moment, with which to add point to their pictures. Thus Barnum's famous "What is it?" was used to make a point against the Abolition issue in Lincoln's election. The two companion pic-

"THE IMPENDING CRISIS"—OR CAUGHT IN THE ACT.

tures of this 1860 collection, "The Impending Crisis" and "The Irrepressible Conflict," had a very large sale, exceeding 50,000 copies each. They represent the failure of Seward to obtain the Republican nomination, and in both Horace Greeley is pictured as the chief agent of the disaster. In one instance Mr. Greeley is depicted as having pushed Mr. Seward off a wharf, and as having been caught in the act by Henry J. Raymond, while General Webb gives evidence as an eye-witness. In the other, Mr. Greeley is throwing Mr. Seward overboard from a boat which Lincoln is steering, and which is very heavily loaded with the leaders of the Republican party. Mr. Seward's famous phrase, which gives the picture its title, was uttered in October, 1858, and had passed almost imme-

diately into the political vocabulary of the people. One of the most peculiar of the caricatures of this 1860 campaign is that called "Progressive Democracy." The manner in which the heads of the Democratic candidates are placed upon the bodies of the mules in this picture is the same as that employed in all the earlier caricatures before the year 1800, and but rarely after that time. Early in the nineteenth century the caricaturists began to form the human features from the face of the animal, rather than to hang the human head in front of the animal's ears as is done in this picture. The prominent position occupied by the Tam-

many Indian gives evidence that the politics of that period did not differ in some respects from the politics of to-day. All these caricatures of 1856 and 1860 were drawn by Louis Maurer.

In the two specimens of the caricatures of 1861, which are here presented with those of later date, the most interesting is that called "The Secession Movement." This is an almost exact reproduction of a very successful caricature of Jackson's time. Its authorship is un-

Fessenden, as Secretary of the Treasury, is turning, shows a productive capacity which will attract the interest, and may excite the envy, of the fiat money advocates of the present time. But the caricature which outstripped all others in popularity in the early war period was that drawn by Frank Beard, called "Why Don't You Take It?" (page 231). This had a sale exceeding 100,000 copies, and went to all parts of the North. It was reproduced, in a weakened form, and placed on envelopes among the count-

### "THE IRREPRESSIBLE CONFLICT."

ON THE REPUBLICAN BARGE IN DANGER.

known. In its original form it represented Jackson "going the whole hog" in his quest for popularity, reaching out for a butterfly labeled "Popularity," and exclaiming, "By the Eternal, I'll get it!" He was mounted upon the hog which South Carolina is riding in the present picture, and behind him upon donkeys rode the members of his "kitchen cabinet," with the exception of Van Buren. The latter, mounted upon a fox, was taking the course pursued by Georgia in the later picture, and was uttering a phrase which he had made public in one of his letters, to the effect that, while he generally followed his illustrious leader, he had thought it advisable in the present emergency to "deviate a little." This fixes the date of the original picture at the beginning of the campaign of 1832, after Van Buren had resigned from the cabinet. The other specimen of the year 1861, "Running the Machine," shows Lincoln's cabinet in session, and gives us a poor portrait of him. The greenback-mill, which

less other devices which were used in that way to express Union sentiment. An interesting collection of these decorated envelopes is among the archives of the New York Historical Society. Mr. Beard's formidable bull-dog was intended to represent General Scott, and in some of the reduced reproductions Scott's name was placed upon his collar. The caricature hit the popular fancy when the Confederate army was threatening to advance upon Washington, and streets were made impassable wherever it was exhibited in shop-windows.

The publication of these lithograph caricatures was continued through the Lincoln-McClellan campaign of 1864, one specimen of which is presented on page 230, showing General McClellan as a peacemaker between Lincoln and Jefferson Davis. This likeness of Lincoln is so inaccurate as to be almost unrecognizable, and is by John Cameron, the artist who drew the cabinet group. Caricatures were issued also during the campaigns of 1868 and 1872, some

PROGRESSIVE DEMOCRACY - PROSPECT OF A SMASH UP.

of which are to be had now. They did not differ materially from the earlier ones, showing very little progress in either design or drawing.

The death-knell of the lithograph sheet caricature was sounded when the illustrated newspapers began to publish political caricatures. They did not do this till the close of the war, though Thomas Nast made his first appearance in "Harper's Weekly" while the war was in progress. His pictures during the war were serious in purpose, and cannot be classed as caricatures. He began his career as a political caricaturist when Andrew Johnson started to "swing round the circle," but his fame rests on achievements of a later period. His series of about fifty cartoons upon the Tammany Ring, during and following the exposures of 1871, constitute a distinct epoch in American political caricature. He was unlike any caricaturist who had preceded him, and his successors

have not followed his methods. He gave to the satiric art of caricature a power that it had never before known in this country, and seldom in any country. It is impossible to look at this work of his, in the light of what had preceded it and of what has come after it, and not say that Nast stands by himself, the creator of a school which not only began but ended with him. He had drawn political caricatures before he had Tweed and his allies for subjects, and he drew other political caricatures after his destructive, deadly work with them was finished, but his fame will rest on his work of that period. While he had no successor in artistic methods, the success of caricature in the pages of an illustrated newspaper was so clearly demonstrated by him, that he pointed the way to the establishing of the weekly journals devoted to that purpose which have since sprung up, and which have so completely occupied the field

LETTING THE CAT OUT OF THE BAG!!

that "Harper's Weekly" and other similar competitors have practically withdrawn from it.

The founder and chief developer of contemporary political caricature in America, as we behold it in the many-colored cartoons of "Puck" and "Judge," was a young artist and actor from Vienna, named Joseph Keppler, who reached St. Louis in 1868 in search of his fortune. He had studied drawing under the best teachers in Vienna's Academy of Fine Arts, but a strong

for a time, and also reappeared upon the local stage as an actor. In September, 1876, the first number of "Puck" of the present day was issued in German, and in March, 1877, the first number in English made its appearance. The "Puck" of those early days was a very different thing from what it is now. Its cartoons were drawn on wood, and were in white and black. The drawing was strong, but the composition of the pictures was almost as crude as that of

THE "SECESSION MOVEMENT".

inclination for acting had taken him upon the stage. During the first year or two after his arrival in America he went about the country as a member of a traveling theatrical troupe, appearing in the theaters of many cities, including those of St. Louis, New Orleans, and New York. His hand turned naturally to caricature, and after vain attempts to sell some of his drawings to daily newspapers in St. Louis, he started in that city in 1869 an illustrated lithographic weekly, in German, with the title "Die Vehme." The subject of his first caricature was Carl Schurz, at that time a conspicuous figure in St. Louis. The paper had a short life, and was succeeded in 1870 by a new venture called "Puck." Two volumes of this were issued, that of the first year being in German alone, and that of the second in both German and English. The enterprise was doing fairly well, when Keppler was compelled to abandon it. He went to New York city in 1873, where he did some work for a weekly illustrated paper

the old lithograph sheets. Keppler at first followed the French and Italian schools of caricature, exaggerating the size of the heads and the length of the legs. He very soon abandoned this, however, and began to feel his way toward the gradual unfolding of what under his guidance has become a distinctly American school of caricature. In 1878 he began to draw on stone, and in order to brighten the effect of his pictures he commenced to tint them slightly with a single color. In 1879 two colors or tints were used, and from that time on the growth has been steady and rapid until the bright and multicolored cartoon of the present day has been reached.

No one can look at the lithograph sheet caricatures of 1856 and 1860 and not be struck with the strong general resemblance which they bear to the cartoons of to-day. There is the same use of many figures in both, and the same mingling of editors, politicians, and other prominent personages in groups and situations illustrating

“RUNNING THE MACHINE”:

and ridiculing the political developments of the day. Instead of using the overhead loops to explain the meaning of the picture, however, our contemporary artists build up elaborate backgrounds and surround the central figures with details which, if the cartoon be a success, help to tell its story at a glance. The artistic merit of the modern cartoon is, of course, far in advance of its predecessors. The style is very different from that of the “Punch” cartoon, which has been developed from the same original source as the American. Both trace their pedigree straight back to Gillray and Doyle, but the development has been in different di-

rections. The “Punch” cartoon of to-day is confined in almost all instances to a few figures, and, except in the great advance made in artistic merit, does not differ in general style from the “Punch” cartoon of fifty years ago. The American cartoon, on the contrary, is a modern creation. It has taken the old group idea of Gillray and Doyle, has made it gorgeous with colors, has built it up and fortified it with backgrounds, and has imparted to the figures and faces of its personages a freedom of humor and a terrible vigor of satire which are peculiarly American. The author and gradual unfold-er of this cartoon is Keppler, who has the honor

THE TRUE ISSUE OR THATS WHATS THE MATTER.

WHY DON'T YOU TAKE IT!

not only of founding a school of American caricature, but of establishing successful comic journalism in America. He has had able disciples and coadjutors in Gillam, Taylor, Opper, Dalrymple, and others, and an invaluable associate and helper on the literary side in H. C. Bunner; but he was the pioneer, and it is to the constantly growing power of his strong, sure hand that the cartoon of to-day, and the success of

the comic journalism which embodies and surrounds it, owe their existence. It is an interesting fact that among the many imitators of "Puck" which have appeared in various places during the past few years, one is established in Berlin. It is modeled closely after the original, is named "Lustige Blaetter," and, after an existence of three years, is now regarded as an established success.

THE ATLANTIC STEAMSHIP.

I SAW thee stride upon the tossing sea  
 What time the pinions of all sail-borne craft  
 Were buffeted by mocking gales that laughed  
 And beat them down into the spumy lee;  
 But onward thou didst urge, erect and free,  
 In the gale's teeth; and streaming far abaft,  
 A league-long, darkling banner thou didst waft,  
 Signal of elemental victory.

A demiurgic triumph thou dost gain;  
 An equal god within thy breast is pent  
 To him who moves upon the whitening main;  
 Thou thronest with great Neptune, and art bent  
 To quell the empire of the stormy rain,  
 And work old ocean's utter vanquishment!

*Titus Munson Coan.*

# THE CHATELAINE OF LA TRINITÉ

BY HENRY B. FULLER.<sup>1</sup>

Author of "The Chevalier of Pensieri-Vani."

## I. NEUCHÂTEL: LAKE-DWELLERS, ANCIENT AND MODERN.

HE Chatelaine of La Trinité had laid her parasol on the churchyard's rugged little parapet, and her glance, ranging across the red-roofed town beneath her and the shimmering lake beyond, now rested fondly on the long line of snow-peaks that faintly finished the prospect toward the south. No sound mingled with the odorous freshness of a serene June morning save the jolting of a single wagon over the stony little street far below, and the decorous diversions of half a dozen children under the big walnut-tree that rose from the grass-plot before the cathedral door. Neither of these, however, had interfered with her brief inspection of the shiny little red book which she still held in her hand, and which she was just on the point of passing back to her companion with a smile that was more or less arch, and which a shade of deference prevented, perhaps, from being a trifle quizzical. This person, a young lady whose general effect was that of bright and restless elegance, took back the volume with the least shade of embarrassment, laid it on top of the parasol, and, giving the Chatelaine a quick interrogatory glance, seemed to put herself unreservedly into her friend's hands. She had purchased the book three days before in Paris; it contained a list of acceptable inns, a sectional map capable of being extended far beyond the cover inclosing it, a thoughtful essay on Alpine geology, and other features of interest to the conscientious and determined tourist. But Miss West now promptly and definitively renounced it, with an instant apprehension that the Chatelaine had tacitly undertaken to make any such commonplace assistance superfluous. And this, in effect, was what the Chatelaine's smile really

amounted to. She lightly threw the book of ready reference aside, picked up her parasol again, gaily extended it toward the long-drawn panorama of the Bernese Oberland, in discreet burlesque of that didactic person through whom pointer and blackboard complement each other, and proceeded to an immediate redemption of her promise.

Now, as a matter of fact, the learner—who had come through the Val Moutier only yesterday, and was totally guiltless of Switzerland, aside from the Jura—might have got much the same instruction from a certain mute mentor within the town itself; for there is a quiet old quay in Neuchâtel, bordered by a row of ancient, high-bred mansions, and shaded by a generous growth of

chestnut-trees, where a sturdy

little brass-plated dial enjoys a close intimacy with all the points of the compass, and faithfully indicates the name and quality of every peak that rears itself above the low foot-hills that close in the lake on its farther side. But Miss West, of course, knew nothing as yet of this fount of information; besides, what platform could be more advantageously placed than her present one, or what pedagogue more capable and sympathetic? So the voice and the sun-shade of the Chatelaine went on in perfect accord and understanding as she marshaled the whole snowy host with conscientious exactitude: the Mönch, the Eiger, the broad-bosomed Jungfrau; the Breithorn, the Schreckhorn, the Wetterhorn, the Finsteraarhorn; Mont Blanc, the serrated Dent du Midi, the sharp tip of the Matterhorn; and finally, best and grandest of all despite its sixty miles of distance, her own Mountain. And her eye sparkled, and her manner took on an added warmth, for beneath those spreading snow-fields stood her ancestral home, and in her mind's eye she saw again the high and rugged valley where her ordinary courtesy title took on a tinge of actuality, and through whose confines she swayed it, in a certain modest, graceful fashion, as chatelaine indeed.

All this time a sedate, serviceable, middle-aged person was pacing with a kind of steady shuffle along the walk at the back edge of the plateau, whence she varied an occasional glance toward her charge by a comparison of the twin spires of the church as they rose before the huddled roofs of the château just behind, or by now and then catching a sidelong glimpse, through the battlements of the wall she grazed, of the foundations of the château itself, as they rose from the vineyards that covered the slopes of the ravine; and to her it became apparent, as the Chatelaine stepped hither and thither with her firm, springy, self-assured tread,—Miss West following with her wavering high heels and her rattling *passementerie* as best she might,—that something, out of sight, indeed, but still at just the present moment more engrossingly interesting than anything actually *en évidence*, was the matter that her young mistress had set herself to elucidate. The matter was simply this: the Chatelaine's godfather, the Governor, had a little plantation between Morat and Avenches,—a trifle of eight or ten acres,—where, in such intervals of leisure as his scientific employments permitted, he engaged in the cultivation of Roman antiquities; and it was her effort precisely to locate this interesting tract, which was shut out from view by the range of hills which separates the Lake of Morat from the Lake of Neuchâtel, that thrust out the Chatelaine's arm and brought such an expression of painstaking peering to the face of her guest. And when, as her guest, this

young American had been received on the previous evening in one of those dim, fatigued, reticent old mansions down there on the edge of the water, the Governor, winding his way into the dusky drawing-room through numerous cases filled with specimens and preparations, and gazing down upon her with the benevolent interest which the professor is sometimes observed to show for his subject, had told her of his little farm and its perennial crop of antiquities, and had assured her of the pleasure it gave him to be able to start their brief course of instruction so nearly at the beginning.

This kindly old gentleman, who was ending his life at Neuchâtel, had spent the beginnings of it at Potsdam and Sans-Souci amidst a certain circle whose extreme altitude I must leave to your conjecture. He had considered himself born to *la haute politique*, and one of his early efforts, more daring than discreet, had ended in a banishment, more or less honorable, to Neuchâtel, then under Prussian rule. But even in this circumscribed field political activity was practicable enough for him; he harassed a succession of North German governors with suggestions and advice, and once, on the occasion of a sudden and unexpected interregnum, himself held the château a few months as acting governor. For all this, however, he never wore the title officially, and he was seldom addressed in such manner to his face; but any one who had a point to gain, or an ax to grind, never lessened his chances of success by whispering behind the old gentleman's back some such word as, "Yes; but would this please the Governor?" or "Perhaps so; but what will the Governor say to anything like that?" He might properly have been called the Professor; but when it comes to a question of title the one bird in the bush may be preferred to any number in hand.

The Governor might have returned to Berlin years and years ago, but Neuchâtel pleased him well enough; besides, where was the ideal cosmopolite to be found if not in a German with French affiliations? In the governor's chair he had attempted a military severity, and in his correspondence he was inclined to aim at an acidulous wit—Frederick and Voltaire rolled into one, you understand; but, when all's said, he remained simply a genial old gentleman, with an inordinate fondness for butterflies and a keen relish for his joke. In earlier years—years when he had regarded himself as quite a piece on the board, years a backward glance toward which almost revealed him to himself in the murky guise of a conspirator—he had been accustomed to read all the most ponderous political publications of the Continent; but in the course of time he tired, as everybody must, of those journalistic Jeremiahs who saw the

heavens falling every time two emperors came within fifty miles of each other, and most of his reading of late had been of a lighter nature. He had a sympathetic familiarity with most of the comic sheets from "Kladderadatsch" to "Pungolo," and found them, he declared, quite as trustworthy as the more serious ones, and infinitely more amusing. And if, as the years rolled on, the politician was overshadowed by the naturalist, it was not that he loved man less but nature more, and his conspiracies against the powers that be were diverted toward the Power that immemorially has been. He delighted in the insect world—when the insects were impaled in rows and correctly labeled; he exulted in the winged creation—when the creatures themselves were properly stuffed and mounted; he was overjoyed to bask in the great smile of nature—when that smile could be modified a trifle by the use of a little geological hammer. And the Chatelaine, who had passed an educational youth at Neuchâtel, and had accompanied her learned relative on many a scientific tramp, was as familiar with the various implements employed in the cosmical toilet as was the old gentleman himself.

Now on this very morning, and at the precise time when the Chatelaine was giving Aurelia West her introduction to the Alpine world, the Governor, with a crumpled letter in his hand, was pacing his library in a state of extreme excitement. This letter had come from the steward of his little inclosure on the Lake of Morat, and though the Governor's reading of it caused the immediate summoning of his chief neophyte from his own study, yet it is gratifying to recall that on receipt of it he was entirely alone. For within two minutes after tearing open the envelop he had abandoned himself to an ecstasy of joy such as might have been considered extreme even in one fifty years his junior. While he did not actually jump out of his slippers, he did give his head a triumphant wag that sent his skull-cap tumbling to the floor; and he started in a rapid walk to and fro through the big room, keyed up to a pitch of excitement that made him all regardless of a certain succession of reflections in the long mirror at the end of it—a fortunate circumstance, since where there are no eyes there is no spectacle, just as where there are no ears there is no sound.

As I have said, the Governor's cultivation of Roman ruins was carried on within a mile or two of Avenches; and Avenches is simply the ancient Aventicum, the capital of the Helvetii, the city beloved of Vespasian, and the most considerable of the Roman settlements in Switzerland—the tale of whose amphitheaters and temples, and basilicas and towered walls, you will find told, since you may never meet

the Governor personally, in any reputable work on Swiss antiquities. Well, the Governor read this old volume from the classic past, and read it very carefully; then he re-read it; then he began to edit it, with emendations and annotations; and at length the day came when he felt himself impelled to add an appendix to it—an appendix, like the original work, in stone and mortar. And the material for this was close at hand. If you have ever spent any time around Neuchâtel you may recall some of the more striking peculiarities of the Jurassic formations. A little scrambling over the Chaumont, or even a ramble on the slopes above St. Blaise, will show you how readily these rocks, block-shaped and lichen-grown, may take upon themselves the aspect of the antique, or even of the prehistoric. Heap a hundred of these upon one another in separating two pastures, and you have the relics of some human habitation antedating history. Pile another lot a little more liberally and judiciously and with a little more of conscious art, and you produce a something which the alert and sympathetic mind has no difficulty in connecting with the first historic civilization known to the land. And the mind of the Governor was a mind of this order. Beginning in a somewhat tentative way, he came in the course of a few years, with the help of a kindred spirit, a fanciful young stone-cutter at Morat, to be the possessor of such an array of baths, barracks, villas, and temples,—overlapping, overcrowding,—that only one other tract of equal size in all the world, the Roman Forum itself, could parallel this instance of infinite riches in a little room.

One year Aventicum Novum would be a wealthy and favored suburb of the older and larger place, when villas would spring up and spread around, and bas-reliefs and mosaic pavements were likely to develop. Another year it would be simply an extreme military outpost from which to keep a sharp eye on the aborigines on the opposite side of the lake, a state of things calculated to produce little beyond barracks and mile-stones. On a third year the same quarter was likely to be given over to the worship of some particular divinity especially affected by old campaigners; and to such a period as this was due a certain temple consisting of two and a half Corinthian columns and an ell or more of entablature; and along with the temple went a single strayed pine which had been partly persuaded, partly coerced, into a semblance of the flat-spreading Southern type, as well as a fractured marble bench set in a bower of laurel. You will judge from the Governor's temple that most of his edifices consisted of ninety-nine parts of imagination to one part of reality—a proportion that I would most earnestly recommend to any

propagator of ruins. Indeed, one who is unable to see a complete basilica in a short, low ridge of battered masonry hardly rising above the surface of the ground, or to pave an entire forum in the course of one forenoon, should avoid this particular department of husbandry.

During this current season the Governor's energies were bent on nothing less than a *marmorata* on the edge of the lake, a wharf at which the stone used in the construction of Aventicum the Elder had been landed after a rafting across from the shore below Mont Vully. To confess the exact truth, the Governor's purpose here was less esthetic than practical; he wished to enlarge his little property at the expense of the shallows before it, and he hoped that the building of a suitable landing-place might come to make Aventicum Novum an occasional port of call. Operations had been going on for two or three days with a greatly enlarged force of workmen, as many as five being occupied at one time — a necessary increase when the manual part of the undertaking so nearly equaled the imaginative part of it. And it was the director of this little force who had sped those startling tidings to his master in his library at Neuchâtel.

On receipt of these tidings, the Governor lost no time. He shook off his dressing-gown, shrugged himself into his street-coat, called loudly for his hat and gloves and walking-stick, detached his chief disciple from a case of beetles, and with him sallied forth. His first impulse was to find his confrères at the college; his second led him in search of the Chatelaine. She would know, would feel, would sympathize. For when you possess a little foothold on a lake in western Switzerland, and when your men report that excavations have devel-

oped rows of rotting piles deeply embedded in the slime and marl of the shore, it means one thing, and only one — lake-dwellings. Let him but communicate this simple fact to his godchild, and her mind would start up into throbbing activity as had his; like a rocket her thought would rush forth over a hundred yards of narrow, spindling causeway to explode brilliantly far out above the water in all the coruscations that must envelop a newly discovered lake-village through the imagery instantly conjured up in the scientific mind when fired by fancy. She, too, would instantaneously drive down a hundred thousand tree-trunks — oak, beech, fir, all trussed and wattled, which would quickly become overspread with a broad acreage of rude planking, which in turn would be covered over with a layer of beaten earth and embedded gravel. From this platform a multitude of huts would rise, built of brush and saplings, smeared over with clay, and roofed with bark and straw and rushes. The cattle would be stabled between, and the free-running pigs would feed their fatness on acorns and beechnuts. The women would grind their wheat and barley between their mealing-stones, and each would bake her cakes and boil her bison-meat on her

GEORGE WHARTON EDWARDS.

own hearthstone. The children, tethered by the foot to a post, would angle through the trapdoors for turtles, or twiddle derisive fingers at the wolf or boar that peered hungrily through the twilight from the strand; the hunter would toil over the causeway with his spoil of stag, or urus, or aurochs; the husbandman, on the main, would mind his wheat-field or his sheep-fold; the potter, with wheel or without, would pile up his product of jar and pipkin; the weaver at her clay-weighted loom would manipulate her hunks of flax; and the worker in skins, or arrow-heads, or fish-hooks would pursue his industrious way. Then some careless maid—oh, joy!—would let slip a bowl or jug through a chink in the rude flooring, or an impatient artisan would hurl a faulty hatchet-head far out over the water, and each would fall, and sink in the marl below, and wait there patiently three or four thousand years for a worthy old antiquarian to come into his own. And his new guest, instead of starting in with Roman readings in one syllable, might now begin with the very A B C of Swiss history, as rightfully she should. Such images as these churned in the Governor's excited brain as, accompanied by his secondary sympathizer, he rustled through the town and scaled the height behind it in search of his primary one.

But what pleasure is complete? The Governor, panting and perspiring, told off the last step of that stony incline, and gained the turf and shade of that churchly little rectangle only to find the field already in possession of another. This was a lithe, graceful, self-assured young man of twenty-five, whose manner seemed a perfect epitome of urban elegance, and whose fantastic costuming, blossoming into every sort of vernal wantonness, affronted those serene presences across the water with a jauntiness that approached blasphemy. Or so it seemed to the good Governor, whose balked impatience was hastening on to the discovery of other affronts more deadly still, when Miss West presented the new-comer as the young Fin-de-Siècle. The Count, she hastened to add, with a certain accent of complacent relish, was just twenty-four hours from Paris. The Governor found it impossible to maintain a complete rigidity before this suave and smiling young man, and therefore unbent sufficiently to present his own companion, the Baron Thus-and-So, mentioning one of the oldest, most famous, and most unmanageable names in all Tyrol, a name which for ordinary use the Governor unceremoniously metamorphosed into "Zeitgeist." The Baron Zeitgeist wore Tyrolean grays and greens, and had hastily slung a *jägerhut*, with one curling cock-feather, across his blond head; and the Governor, whose eye, indeed, was not altogether dimmed to pictorial effect, thought that

this was as far as any young man need go when posturing before the Alps.

The Chatelaine had not yet recovered from the shock which had come to her with the dawning of this brilliant Parisian apparition beneath the shadowed arch of the church door, and to the Governor the sight of that bright and knowing face lighted up a million gas-jets in competition with the blessed light of day, while every foot-fall of those dapper boots helped to spread a field of asphalt over the green churchyard turf; but Aurelia West had often seen the like before, and she lost no time in demanding of the Count, with an aggressive audacity, and a seeming consciousness of the superfluity of the question, what he was doing in Switzerland. Well, he was there as a fictionist; he was picking up material. This he said with the air of a man who thought one answer would do as well as another. No interest, he declared, was equal to the human interest. And humanity was never so interesting as when at a disadvantage. And it was never more at a disadvantage than when amusing its leisure; nor at a more supreme disadvantage than when this leisure found it disporting before the great front of nature. He looked calmly around the little group, waved his hand in a businesslike way toward the Jungfrau, and presently retired into the shrubbery to jot down this little string of epigrams. Not every one would think them worth saving, but the appreciation of values differs, and they were saved, and appeared in print in Paris in the autumn. I simply mention this fact here because the "Étude d'une Âme" may never have come to your notice.

The Governor, who inwardly confessed himself a little put out, but who hardly fancied himself as figuring to any great disadvantage, opined that for this sort of note-taking their own quiet little town might not be so good a field as Lucerne, for example, where a brass band might be listened to on the Schweitzerhof Quay, whence the Rigi might be ascended for the sunrise, and where, as he understood from the prints, Mlle. Pasdenom, also from Paris, was shortly expected to open out with an Offenbachian repertoire on the stage of the Casino. This last chance shot found lodgment somewhere, for the Count, a trifle dashed, hastened on rapidly to another set of reasons. This time he was merely winging his flight across a corner of the country on his way down to Italy; he was going to see his friend, the Marchese of Tempo-Rubato, who had a hunting-box in the mountains above Bergamo, and his father, the old Duke of Largo—everybody knew the Duke. All this, and much more, to Miss West; and that young lady, thankful to have gone no farther beyond bounds, and inwardly resolving hereafter to keep within bounds still more circumscribed, astutely started out on a little course

of thought quite her own. For one thing, she should beware in the future of any reason that seemed too plain, too simple. For another thing, she should certainly hear the band play on the Schweitzerhof Quay.

If Fin-de-Siècle, during his winter's acquaintance with Aurelia West, had given that indiscriminating young woman more admiration than respect, he was now bestowing on the Chatelaine a considerable degree of respect, no particular degree of admiration, and an insufferable degree of curiosity. He began his note-taking on the churchyard terrace with all the ardor that a new type inspires, and he continued it on the steamer deck, as they sped in all haste toward Morat, with an absorption that thrust landscape and antiquities equally into the background. The Governor had collected his little party with the least possible loss of time, and his satisfaction as to its composition was complete; for among the group of quiet, suave, well-fed old gentlemen aft was his great confrère and rival, Professor Saitoutetplus, whose complacency since the discovery of a lake-dwelling or so on his own frontage near Cortaillod had been a thorn in the Governor's side for many a year past. And the others, if less prominent as landed proprietors, were equally eminent as scientists; every one of them, at some reunion or other, had laid his "paper" on that dusky damask table-cover of the Governor's, and had contracted his eyebrows to stop the tinkling of the prisms on the tarnished candelabrum at his elbow. And now they sat there together on the shady side of the paddle-box, conversing amiably enough, but ready at any moment to sink the friend in the controversialist with a suddenness and completeness that would throw a stranger into a panic of apprehension. But the friend, although he sank, never failed to rise again; and the Chatelaine, when contentious voices began to rise, knew that conversational life-preservers were close at hand, and gave no evidence of being in any great degree disturbed. She, with the other young people, was well up toward the bow; and thus the *Hirondelle*, with youth at the prow and learning at the helm, sped on her way.

The Chatelaine, whose wardrobe was doubtless small and simple, wore for this excursion just what she had worn upon the terrace—a gray woolen gown, a small bonnet of brown straw, not altogether unlike a poke, and a garment which I venture, with some diffidence, to term a pelisse. To have called her aspect archaic would have been unjustly severe; yet to have called it wholly unfashionable would have been quite within the bounds of truth. But as this strong, serene, cool-eyed young woman trod firmly from one side of the boat to the other, her glance ranging freely over lake

and mountain, and her head raised finely to catch the freshening breeze that swept athwart the bow, Aurelia West could not but speed one shaft of envy toward this young creature set so high that she was able to ignore all current conventionalities and yet become in no degree absurd. As soon request the Alps themselves to change their robe of snow and pine-boughs as to ask the "taste for nature" to wax or wane or vacillate.

Meanwhile Fin-de-Siècle pursued his inquiries with an unabashed directness that a complete gentleman might well have hesitated to employ. When he learned that the Chatelaine's idea of dissipation was San Remo, he felt that he had made a point; when he discovered that her ideal of splendor was Geneva, he felt that he had made another; when she said that she had never witnessed a real dramatic representation, he squeezed his own elbows in ecstasy; and when she avowed that little in her reading had been more recent than "Paul et Virginie," he was almost charmed into silence. The Chatelaine was able to meet all his inquiries with serene composure, and at the same time to give some heed to the painstaking little profundities with which the young Baron Zeitgeist was trying to chain the wandering attention of Aurelia West; and once, too, when a group of peasant girls, who were attired in the sober holiday finery of the district, and who sat huddled together in an obscure corner not far away, began modestly to croon some old folk-songs, she added her own voice to theirs. Zeitgeist had been in America, as he had lost no time in informing the new arrival on meeting her in the Governor's salon, and his talk referred to a time and place quite other than the present. So did the talk of the Governor's friends, occasional bits of which floated now and then to Aurelia's ears. But she was giving very little heed to either the one or the other. Now and then she heard a word of the stone age, indeed, and again of the bronze age, and again of the age of iron; but she herself knew only one age—the age of flesh and blood. To the Chatelaine, of course, the proper study of mankind was antiquity; but from her own point of view the proper study of mankind was man, and the particular man now in her thoughts was the one who had followed her, or some one else, from Paris.

The steamer had now left the Lake of Neuchâtel, and was bumping on, as best it might, through the narrow channel of the Broye. The motion had become too violent and irregular for the singing peasantry, and they lapsed into silence. The steamer presently jarred against a scowful of mowers whose work grazed the edge of the stream; a boy who was knocked overboard from the stem of the scow was

brought up by a big boat-hook, and the intervention of the officer in command prevented the boarding of the *Hirondelle* by a horde of angry agriculturists. A quarter of a mile farther the boat grazed bottom, and a rod beyond this it stuck fast, and nothing but the straining, writhing, pushing, and shouting of the entire crew made the accomplishment of the trip a possibility. But none of these minor mishaps had cast a single drop of water on the flames of controversy now raging among the savants of Neuchâtel. The Chatelaine, looking back, observed that her godfather was quite red in the face, and that the worthy Saitoutetplus was moving his umbrella in a fashion totally foreign to the usual manipulation of the olive-branch. Monsieur was being requested to recall how it had turned out not merely at their own Concise or Yverdon, but also at Wauwyl, at Wangen, at Robenhausen, where by no chance could the potter's wheel have been employed. And again, would monsieur be pleased to remember that the jar had not been found in the peat itself, but in the first stratum beneath it—a consideration that rendered necessary a reconstruction of the entire theory. But, on the other hand, the *cher professeur* must not lose sight of the important fact that the jar had been clearly shown to contain not carbonized acorns, but beechnuts, which permitted an entirely different interpretation of the matter. Meanwhile the Chatelaine watched for the appearance of Morat's high-set castle-tower, with its pair of attendant poplars, and, seeing them, felt that deliverance was nigh.

Morat, rising steeply from behind its frontage of ruined sea-wall and its rounded clumps of willow, is a compact, bustling little place, and as picturesque, in a hearty, downright fashion, as a purely Protestant town can be. For a touch of the pensive and forlorn thriftlessness that the Church may bestow our friends waited for Estavayer, which had a place in the circuitous route that took them home. But Morat possesses two features which even the most troublesome esthete must appreciate—an inn which offers at once a good dinner and a good view across the lake from its high back windows, and a town-wall which, more than any dinner, must make the mouth of the discriminating visitor water. Our friends despatched their lunch in the big public room, crowded with a jostling, good-natured fair-throng, and then, in deference to the visitor from over sea, made a little excursion on the wall, a tiny semi-circle of less than half a mile, all told, with a huddle of steep roofs within and a fine spread of gardens and open meadows without. It is a rugged old fabric, broken through by a dozen awkward towers, and covered for its whole length with a rude peaked roof that rests on

a rough timber framework, set with wabbling lines of coarse old tiles; but it deserves a place among the minor promenades of Switzerland, it is so authentic, so accessible, so abounding in pleasant and ever-shifting glimpses of lake, town, mountain, and country-side.

But the Governor's impatience over Aventicum left very little time for any other place, and his guests presently found themselves seated under his famous old pear-trees near the Temple of Mars, while his chief Roman was offering them by way of refreshment the choice between gooseberries and buttermilk. Then they were shown the remains of the basilica of Aulus Perfidius, whose treachery to the Roman cause, as explained by Zeitgeist, was the reason for the removal of a good part of this structure in favor of a barrack for the Thirteenth Legion: a row of *cippi* commemorating various members of that body now formed a border for the asparagus-bed. They saw numerous other novelties and rarities, and on the way home they stopped at Payerne to glance at the old Benedictine abbey, from the broad archway of which half a hundred shrill-voiced school-children were being scattered broadcast, and to look in at the old church where the saddle of good Queen Bertha is to be seen, with its hole for her distaff. And they took time at Estavayer while waiting for the homeward steamer, to run over the causeways and through the courts of the fine old brick château; and they glided into the port at Neuchâtel as the stars were coming out and the dews were making it worth while to feel a new seat before taking it; and Aurelia West was fain to acknowledge to the Chatelaine, as they walked home along the darkling quay, that not for many a day had she been more completely filled with panorama, medievalism, and classicality. But the lake-dwellers? Yes, yes—that is a question I can answer; but it is one that I had hoped you might forgive to ask.

Well, none of us need to be told that a single whiff of real fact may quickly dissipate a whole bushel of antiquarian chaff. And all of us can understand that the humbler the fount of information the harder it is to gulp down its gushings. There are certain features connected with that afternoon at Aventicum Novum which the Governor never cared to linger on, and which were never afterward referred to in his presence. The plain facts are these: the Governor's steward had a father; this father, an octogenarian down in a cottage by the shore, had a memory; and this memory was able to connect the work of the lake-dwellers with certain work of his own lost both to sight and recollection for fully fifty years. That was all. The Governor's fancy had gone up as rockets do, and had come down as rockets will; and now, when the worthy Sai-

toutetplus is minded to take a bit of a stroll among the lacustrine relics at the college, he does it without the company of his friend.

The Governor, before returning to Neuchâtel, left directions with his steward—the same to be forwarded at once to Morat—for a handsome sarcophagus in which suitably to inter a young lady whose biography he had just improvised, and with whose monument he wished to begin a prospective Street of Tombs. The name of this fair unfortunate was Julia Placidia, and she had accompanied her father, the commander of the Thirteenth Legion, from Rome. The general, who was no

great novel-reader, was at a loss to understand why his daughter should have insisted upon following him to so remote and inhospitable a region; but we of this modern day know without the telling that she was secretly attached to one of her father's subordinate officers, a very handsome and promising young man. The Governor hesitated whether to make the cause of her death pulmonary or pectoral; had she died of consumption or of heart-break? Most of the young people—so near to the end of the century are we come—pronounced in favor of delicate lungs, but the old gentlemen from the college pleaded unanimously for a broken heart. I do not know what decision was reached, or, indeed, whether the inscription specified the cause of her demise at all, my

Latin is so indifferent; but be that as it may, the soft-hearted young sculptor at Morat was able to give to the sarcophagus the last refined touches of pathetic mutilation, and the untimely taking-off of this fair young thing filled the Governor himself with a pensive complacency for fully a fortnight.

## II.

### THE JURA: BOUND TO THE CHARIOT-WHEELS.

AFTER the obsequies of Julia Placidia the Chatelaine and her friends set about the recovery of their spirits by means of a series of little fêtes and excursions, not too hilarious and not too suddenly begun. They started with a sedate ramble over the heights of the Chaumont, and they continued with a little run, partly by rail and partly on foot, up through the glories of the Val de Travers. One day came a picnic on the grassy slopes above the towered and gabled old manor of Cornaux, whence the Lake of Biemme, along with red-tiled Neuveville and the inviting Isle of St. Peter, spread out a soothing little sonatina in quietly blended blues, reds, and greens; and on another day they betook themselves up to La Chaux-de-Fonds to spend a few hours among the watchmakers, much to the delight of Aurelia West, in whose breast the shopping instinct, like hope, sprang eternal, and in whose eyes the pleasant peculiarities of the Jura landscapes had not yet lost their

charm. And in the course of a week they had so far left their grief behind as to attempt a quiet little fête in the prim old garden behind the Governor's house. They summoned hither half a dozen shy young students and a corresponding number of straight, self-conscious maidens,—the daughters and nieces of professors,—and attempted a bit of dancing *en*

*plein air* to the music of a flute, a violin, and a violoncello. The cello was manned by Zeitgeist, and the flute was looked after by the Governor himself, who would have resented the least imputation of rheumatic finger-joints as the worst of insults; and the efforts of both were directed by the violinist,—a townsman and a professional,—a nervous, elderly little man whose interest in the occasion rather overshadowed the deference that he should have shown to such distinguished amateurs, whose slightest slip he rebuked and corrected with Draconic severity. The Governor was brought to book half a dozen times or more, and at last was smilingly obliged to confess himself rather out of practice; but Zeitgeist, whose instrument was his constant traveling companion and in almost daily use, escaped with merely a rap or two. Miss West, who had observed the peregrinations of the cello with some amusement and little less concern, once made bold to ask its owner why he had not chosen something smaller; but she learned at once that nothing else could quite meet his particular requirements. The violin was too shrill and shrieking; the viola was too robust and ramageous; only the soulful sonority of the violoncello could give adequate expression to his passion and his pain. But to the Chatelaine there was nothing that required special comment in the journeyings of that big green bag; for more than once she had seen an unwieldy sitz-bath bumping its way up the Nicolaithal to Zermatt, and last year she had made the acquaintance of an elderly *Anglaise* who had carried a parrot in an enormous cage all the way from Plymouth to Pontresina and back again.

The days went on quickly and pleasantly, and Aurelia West was pleased to find herself slipping more easily and more completely into the round of cheerful serenities that marked the course of life at Neuchâtel. This was precisely what she had come for, and it would be agreeable enough for a few weeks, after the distractions of Paris and the diversions of the Riviera. It was on this southern shore that the two young women had first become acquainted, during a month passed between Mentone and San Remo, and the Chatelaine had left La Trinité for Neuchâtel in order to meet her guest, as I may say, upon the threshold. Yet, while the Governor's little fêtes and excursions had half rubbed the Rue de la Paix from her memory, and had jostled the last Battle of Flowers two or three degrees along the road to ancient history, still they had not done much to quiet the feeling of doubt and surprise and general uncertainty which rose and fluttered whenever she looked back on that day's journey of hers from Paris to the Alps.

She had made the journey alone. When I say "alone," I use the word in a narrow, technical sense; she was accompanied by no friend, no relative, no chaperon. The relatives in whose care she was to have gone were obliged to give up their idea of Basel at the last moment, and to this independent young woman the eight-hour trip across France by daylight did not present itself as an undertaking of any extreme difficulty. But as for company unrelated,—company in the plain, ordinary sense,—she had enough and to spare, as you shall see.

She had made all her arrangements to depart with the *éclat* proper to one of the colony who was so fair, so young, and of a position so assured. Her costume was distinctly in the mode, and that mode at its highest. Her traveling-wrap was in a large, light plaid, which, even in the piece, looked striking enough; her hat showed a width of brim and a wealth of adornment that more than met the necessities of the case; and the handle of her parasol was incredibly long and ornate. Still, whatever her aunt may or may not have said, before or after, there was nothing in her get-up—as she invariably insisted when looking back upon this curious day—that was not completely justified by the plates in "*La Mode Illustrée*." Her bags and other belongings were equally modish, a dozen people of consequence had assembled at the Gare de l'Est to see her off, and nothing in the world had been wanting to give her departure the proper effect except a minute or two of time. But a wretched accident had delayed her five or more, and when her uncle hurried her through the *salle d'attente* to the platform, a dozen apprehensive friends, who had bought tickets to the first station out that they might pass the guard, had given her up; the porters were running along swiftly as they slammed the doors of the carriages, and her attendant, wrenching open one of the compartments, had only time to push her in when the train started, even before she had found her seat. No bonbons, no flowers, no hand-shaking, no kisses; but as the train pulled out she was solaced by a momentary glimpse of a traveler more unfortunate still. A young man—a *boulevardier*, it seemed—came struggling through the crowd with a new portmanteau in one hand, an immense bouquet in the other, and an evident intention on the carriage before hers in his every movement. His figure seemed familiar enough, but his hat was jammed down over his eyes and nose. He stumbled and fell. The portmanteau burst open. The bouquet flew to pieces. What became of the youth himself she had no time to see. Nor was she disturbed by the spectacle which her uncle presently offered to those remaining behind—rushing after the train with outstretched arms, as if to pull it back by main

force, and finally being carried off to the waiting-room to quiet down and to pull his scattered wits together.

She found herself in a third-class compartment; it was none too clean and it was very crowded. The occupants were both men and women—about half and half. They were not old, nor were many of them exactly young. None of them, taken singly, would have caused a second thought, perhaps; but their associated effect was peculiar. In the mass there was a singularity of attire, a curious, intimate, democratic, though half-smothered, familiarity of association, and a certain noticeable sameness in physiognomy not to be overlooked. Nor did they, on their part, ignore her own attire and physiognomy. They scanned her, studied her—men and women both—with a stealthy, furtive, insistent interest which presently began to annoy and even to alarm her. After a little time one or two of them spoke to her, and with a certain civility; but it was a civility that came more from policy than from good will. And before long they showed less of civility and more of a sense of restraint and injury, and she began to feel that she was the discordant element. This discovery pained her; she had no wish to act as a wet blanket on anybody's holiday. But doubtless these good people would be getting off after another five or ten or fifteen miles, and if she could stand it, they might, too. But they did not get off after five or ten or fifteen miles. They went on as long as she did—and longer.

Presently sounds of joy began to issue from the compartment next behind. There were two or three shrieks of laughter in high female voices, and the tones of a big bass voice, which must have proceeded from a head thrust out of the next window, came bawlingly into theirs. Then there was a noise as of some one pounding on the partition close to her head with a bottle—a sign of greeting, as it seemed, to the people locked in with her. She started; but of those around her more frowned than smiled, and she realized bitterly that she was a kill-joy indeed. A large, round-shouldered man, who had not shaved himself that morning, and whose taste in neckwear she could not approve, sat opposite her. He was humming a jerky little tune under his breath, and was accompanying himself by strumming on the window-pane with a set of fingers adorned with a large and valueless ruby. At the first stoppage he ceased his impatient exercise, left the carriage, and forgot to come back again. And a woman, whose oily black hair was laid in great scollops against her temples, and whose full throat was encircled by a coarse-meshed collar of dubious point, looked after him as if she would like to follow.

The forenoon wore on, and other stops now

and then gave Miss West glimpses of other passengers. The most conspicuous of these were certain gentlemen—quite a number of them, too—who were dressed in an exaggeration of the prevailing mode, and who were most active whenever a stop gave easy access to a restaurant or a buffet. They carried little glasses of cognac or kirschwasser, or anything else that offered, and their steps invariably led them to one particular carriage—the first or second ahead of her own. She saw them again and again; and presently it occurred to her that none of the old passengers were leaving the train and that no new ones seemed to have boarded it. Many of the station-masters, too, were showing an interest more personal than was common to that indifferent gild, and that interest followed close on the convoy of kirschwasser and cognac.

The hours dragged on wearily and uncomfortably enough. They passed Nogent, Troyes, Bar-sur-Aube, and in due time they reached Chaumont, where there was a longer wait than usual. Here she saw the window-strummer on the platform, and noticed that he was pointing to her compartment. And presently one of the bearers of kirschwasser came walking down past the long succession of open doors, and paused at hers. He wore a dark, pointed beard, his trousers-legs had the sensuous, undulating swing so dear to the Parisian tailor, and his collar displayed the low cut so beloved by artists of a certain circle. He carried a little glass of liqueur in a hand on which the manicure had exercised an exaggerated care, and he offered his refreshment with a smile whose intent was that of the most attentive assiduity. As he approached her the women opposite bridled most self-consciously, and when she drew back with alarm and offense so plainly in her face that he could only retire with a stare and a shrug, her traveling companions finally lost all patience with her. The people in the next compartment were trolling the drinking-song from "Giroflé-Girofla" with a spirit and precision that quite surprised her, and now the people in her own threw off all restraint, and joined in with them.

She retired into her book, and the loosened tongues around her began to do a little wagging. They talked brokenly, abruptly, of a variety of things that she found herself unable to follow; it seemed to be the phonetic shop-talk of some established but exceptional profession. They spoke now and then of *la Duchesse*. Once a reference to this personage was attended by the throwing up of a thumb over a shoulder in the direction of the carriage ahead, and Miss West found herself wondering whether it was the Duchess whose thirst was so unquenchable and required such constant ministrations.

Presently one of the women stooped down, thrust her hand under the seat, and pulled up a package of sandwiches and a bottle of *ordinaire*. She studied the situation for a moment, and then, with a manner which she could not make non-committal enough to meet her own views, tendered a share in these refreshments to our uncomfortable traveler. Miss West was hungry enough to accept food and drink even at the hands of a duchess's tirewoman or kitchen-maid, and it seemed to be the general sentiment of the compartment, as she bit into her sandwich, that she was coming to her senses.

At the next stop she ventured to alight and to take a few steps up and down, for she felt very tired, cramped, and uncomfortable. The deserter from her own compartment pointed her out to two or three of his fellows, who followed her movements with a curious interest, and now and then some other man from a higher social stratum seemed half prompted to the tender of some civility which in the end he reconsidered and withheld. She glanced along the train. There was one goods-van more than might have been expected from the limited number of carriages, and it was noticeably larger than the average. Yes; the great lady, whoever she might be and wherever going, was moving along *en grande tenue*, and was carrying her whole household with her. But why not have added a few extra carriages to the train? Why compel one who was accustomed to the drawing-room to travel, as it were, in the kitchen? She looked toward the carriage that she fancied to be occupied by the *grande dame* herself, but the door was closed, and the kirschwasser was handed in through the half-curtained window by a *garçon* who came tripping out from the buffet, and who carried back a five-franc piece with the empty glass. How pitiful, thought Miss West, for an elderly lady to become so confirmed in such a habit; though, to be sure, almost every member of the aristocracy had some engaging little eccentricity or other.

The afternoon was wearing on. The long, straight white roads, and the long, straight, interminable poplar-rows of mid-France had been left behind some time since; the country had become broken, hilly, even mildly mountainous — at least there were suggestions of the mountainous that made the passing show worthy of more attention; most of the ducal retainers had dropped off to sleep, lying back in uncomfortable and unprepossessing attitudes; but from somewhere or other above the ceaseless click-click of the wheels came faintly and intermittently the squeaking notes of a violin. Then it seemed as if there might be two of them, and that they were running informally

through a little passage in thirds and sixths; and presently above the dull b-r-r-r from the rails there seemed to beat itself in on her fast-dulling ear a familiar snatch from "La Jolie Par — La Jolie — La Jol —" She nodded, caught herself, the train slackened, and they were at Delle, on the Swiss frontier.

She decided to do what she could toward getting the Duchess and her vast establishment through the customs, and so left her compartment once more. But the examinations were not so searching as she had expected, nor was she herself as alertly wide-awake as she had judged; and but for a strong arm, dexterously exercised, she might have been left behind altogether. This arm belonged to a gentleman whom she had seen only once before during the day, but to whom she had assigned a high position in the ducal household — the eldest son, in all probability. He, as the train was moving off, seized her firmly, thrust her into the nearest open door, promptly followed her himself, and gave the door a slam behind them.

She found herself in a first-class compartment, comfortably spaced and luxuriously appointed. The velvet rug was littered with broken biscuits and crumpled rose-leaves, and four people already occupied the four corners: a lady, her maid, and two gentlemen, one of whom held a bird-cage containing a pair of parrakeets, while the other was trying to amuse a pug-dog whose harness was set off with bells and blue ribbons. The third gentleman, her rescuer, signed her to a seat between the dog and the birds, and placed himself between mistress and maid. He was a man who was approaching thirty — he was twenty-eight, let us say. His aspect was one of richness and distinction; his manner had breadth, freedom, mastery. He seemed a patrician who could hold his high estate, or lapse away from it and gain it again, all with equal ease, grace, and elasticity, and wholly uninjured in the opinion of himself or his associates. He had a devil in each eye; one was laughing, the other — not. It was the laughing one that flickered before Aurelia West as he presented her with an off-hand informality, difficult to describe or to endure, to the lady opposite her, whom he simply designated as the Duchess. As to her own identity, that appeared to be understood by everybody, the Duchess included.

In this personage Aurelia West was surprised to find a woman not more than a year or two older than herself, though a first casual glance might have made her four or five. With her feet crossed she lolled back against the quilted head-rest in a costume in which Miss West found ample justification for her own. She wore her hair in a bold, original fashion, which was much too eccentric and unauthorized for

anything like imitation, and her elaborate complexion was applied with a careless frankness that only a very great lady would have dared to employ. She did not suggest the Faubourg St. Germain, by any means; but Compiègne, in the later days of the Empire, was not altogether beyond the pale of consideration. She turned a pair of big, dilated eyes on this new and sudden arrival, made an indifferent effort to extend a hand, and carelessly asked her, in an accent not completely Parisian, how she was standing the journey. Then, with an air of knowing everything and everybody and all about them, she brought back her wandering attention and chained it to her own personality. Her conversation was chiefly with the athlete who had made the immediate continuation of Aurelia West's Swiss journey a possibility. She addressed him sometimes as *cher Marquis* and sometimes as *caro Marchese*, and at irregular intervals she mumbled bits of Italian at him without turning her head. Her associates took as much for granted and gave as little heed; the gentleman with the bird-cage was the one who had made the offer of refreshment, and he gave even less. He ignored the newcomer completely, and Aurelia West began to feel even more uncomfortable and out of place than she had felt in her other quarters. She was tolerated only because she was there, and there unavoidably; and the more assured they seemed as to her identity the more uncertain she became about it herself.

They had left Porrentruy and its castle a few miles behind, and the scenery, now that they were fully within the Juras, was taking on its most acutely characteristic aspect. And with this Aurelia West was fain to solace herself for the discomforts and mortifications of her present position as best she might. True enough, the outlook on the side of the bird-cage was closed, but the other side was free; and so between the pug and the maid she gazed out upon the rapid succession of heights and depths and crags and streams and

fleeting shadows that marks this entrance into Switzerland. At Ste. Ursanne the train crosses loftily over the picturesque valley of the Doubs, and pauses long enough for a brief look at the quaint old town and its ruined castle set high up on a precipitous steep, and the suddenly doubling river winding far below between its craggy banks. Aurelia West

was taking this first glimpse as an earnest of other glories yet to come, and she gave no great heed to the person who stood there with his hand on the carriage door in low-voiced conversation with the Duchess. He was of middle age, and his face expressed a fairly successful union of the practical and the esthetic. He looked, too, as if he had the weight of the universe on his shoulders—the universe plus the Duchess. And the Duchess was adding to the weight by a series of sharp, insistent questions. Where, for example, had he been all this time? Why must he bestow so much time on Mlle. La Rossignole and her needs. Was n't she old and experienced enough to look out for herself? And why had there been no kirschwasser for poor Chou-Chou back there at Porrentruy?—the little beast, meanwhile, thrusting out his pop-eyes and jingling his bells as if insisting on an answer, too. And why—why was it necessary to have the new contralto in this particular compartment? Could no other place have been found for her? And how was anybody to get along with one so glum, so rude, so unsympathetic?

Eh, Mademoiselle, the new contralto? *Mais, oui*; surely a place had been found for her—one in his own carriage.

In monsieur's own carriage? Then who, *juste ciel!* was—? and his puzzled questioner shrugged her shoulder in the direction of the absorbed Aurelia.

There was an exchange of glances and a lifting of eyebrows all around. The man of affairs shut the door and hurried away, leaving his associates to adjust themselves to this altered state of affairs. The *prima donna asso-*

*luta* exchanged a few words with the Marquis in Italian, and Miss West presently found herself the object of a slightly increased interest. The less she belonged to them, the more, it seemed, they cared for her; and when they learned that her destination was not Basel, but Neuchâtel, their interest quickened still a little more. For in that event Mademoiselle must change at Delémont, and Delémont was barely

ten miles ahead, a change presently made to the easing of all involved. The gentlemen civilly assisted her to alight, her luggage was bundled out from her former quarters with a hearty good will, and as their train sped away in the twilight the words of a deplorable couplet from "Le Petit Faust" floated back from the raucous throats of a score of men packed in the last carriage.

(To be continued.)

Henry B. Fuller.

## ITALIAN OLD MASTERS.

VITTORE CARPACCIO.—1440 (?)—1520 (?).

ARPACCIO is one of those masters of the great period of Venetian art about whose lives we know the least. We know that he was born in Istria, then one of the possessions of Venice; and we first hear of him as a painter in connection with Lazzaro Bastiani (of whom Vasari makes two persons, brothers of Carpaccio), who was a member of the school of S. Girolamo, in Venice, in 1470. It is a rational conjecture that as the two were friends so close as to be reported by Vasari to be brothers, they were of approximately the same age and could hardly have been admitted painters earlier than thirty. As Cavalcaselle points out, Carpaccio's later works show the decay of his powers, and were painted about 1519; so he may be accepted as having lived till 1520, and to have died at a ripe age, which, for want of any clue, we may guess to be eighty. We have no more precise indications of the date of either his birth or his death. He was a pupil of the elder Vivarini, and afterward of Giovanni Bellini. He is reported to have accompanied Gentile Bellini to Constantinople, to which experience may be attributed his fondness for Oriental costumes in his pictures. The great series of subjects from the life of St. Ursula, now in the Academy at Venice, which gives the best as well as the most favorable conception of his work, was executed after 1490. The series of pictures in S. Giorgio degli Schiavoni, which Ruskin has brought into great prominence in the history of art in Venice, was painted by order of the confraternity of the Hospital of St. George. This confraternity, founded in 1451, received from the prior of the monastery of St. John of Jerusalem a hospice from among the buildings of the priory, and this building having become ruinous, the confraternity replaced it by a more splendid one, with a chapel which was com-

pleted in 1501, and dedicated to St. George and St. Trifon, a Dalmatian saint and martyr. An early historian of the principality of Montenegro, then the principality of the Zeta, says that its last sovereign, George Cernoieitch, married a noble Venetian lady, who, tired of the bleak seclusion of the rugged home to which she had come, persuaded her husband to return with her to Venice. Accordingly he took up his permanent abode there, and, finding no orthodox church in the city, had one built which he dedicated to St. George. His name appears for the last time in the records of Cetinje, the capital of Montenegro, in 1495, and his will exists, dated at Milan in 1499. The association of St. George of the Slavonians and St. Trifon, an orthodox and Slavonic saint, with the avowed purpose of making a refuge for the mariners at Dalmatia, which was then as now mainly an orthodox country in its lower provinces, and the coincidence of times and names, leave no room for doubt that S. Giorgio degli Schiavoni is the church of George Cernoieitch, since it is the only one to which we can refer the data. There had been for several generations an alliance between the Zeta and Venice against the Turks. The sea-coast along the part of Dalmatia opposite the Zeta was in the possession of Venice, and the Zetans served as guards to the caravans from the Adriatic across the Balkans to the Black Sea and Trebizond. Before taking a wife from a noble Venetian family, George Cernoieitch had been inscribed in the Golden Book of the nobility of the state.

The pictures in S. Giorgio were painted between 1502 and 1508, in the early portion of Carpaccio's most masterly period; but I cannot agree with Ruskin's laudation of the art in them, considered in relation to the other works of Carpaccio, any more than with what seems to me his extravagant praise of the art of Carpaccio in relation to the rest of Venetian art.

A DETAIL FROM THE LEGEND OF ST. URSULA, BY CARPACCIO.

Speaking of the "St. George and the Dragon" in the series, and especially of the distant figures of the sultan and his daughter, Ruskin says :

For truly,—and with hard-earned and secure knowledge of such matters, I tell you, through all this round world of ours, searching what the best life of it has done of brightest in all its times and years,—you shall not find another piece quite like of that little piece of work, for supreme, serene, unassuming, unflinching sweetness of painter's perfect art. Over every other precious thing, of such things known to me, it rises, in the compass of its simplicity; in being able to gather the perfections of the joy of extreme childhood, and the joy of a hermit's age, with the strength and sunshine of mid-life, all in one. Which is indeed more or less true of all Carpaccio's work and mind; but in this piece you have it set in close jewellery, radiant, inestimable.

No one can dispute Ruskin's enjoyment of this phase of art, or his right to establish his own standard of art for his own enjoyment and teaching. I can only point out that the standard is one which does not conform to that of the greater experts in art, the painters themselves, or with my view of a healthy definition of art itself. The infirmity of his judgment is further shown in what he says of some little pictures in the church of St. Alvise, which he attributes to Carpaccio, but which the highest living authority in that particular line of judgment,—not only in my opinion but in that of Cavalcaselle, and whose knowledge is even admitted by Mr. Ruskin,—C. F. Murray, distinctly declares to have no trace of the workmanship of Carpaccio beyond the evident imitation of some of his peculiarities of drawing by a follower whose inherent feebleness Ruskin mistakes for the youth of the master. But he says, with that peremptoriness of opinion which leaves no chance of modification, except in confession of ignorance, that "in all these pictures the qualities of Carpaccio are already entirely pronounced; the grace, quaintness, simplicity, and deep intentness on the meaning of incidents." It is true that Crowe and Cavalcaselle enter these pictures in the catalogue of works of Carpaccio, but as "school pictures," a term at which Ruskin inveighs, but which is in precise accordance with the opinion of Mr. Murray. To give the best view of such an extraordinary estimate of the qualities of Carpaccio, I can only say that Ruskin forms his opinion of the painter (and to a great extent of all art) on the quality of story-telling, which I hold is not, properly speaking, the art at all, but is the thought of the man, and is always to be held utterly distinct from the manner in which the story is presented, which is his art.

The "History of St. Ursula" gives higher proof of Carpaccio's preëminence as a story-

teller than do the pictures in S. Giorgio degli Schiavoni. Though he afterward painted some pictures which are to be ranked higher as art, they are more under the technical influence of the greater painters of the school in which he had his training—a training which, like that of Tintoretto, was interfered with by what must be considered as a refractory originality. He had the Venetian sense of color in a high degree, but in his use of the material he never attained the technical perfection of the secondary masters, such as Palma and Lotto. The telling of his story was evidently more important to him than his technic, and the painting in the Slavonian series is thin and in parts slovenly. What is said of his method by Cavalcaselle, referring to his best work, I accept as proof that he had never attained the complete mastery of oils that some of his contemporaries gained. He began like Bellini with tempera, but unlike Bellini he never rid himself of the influence of his original method of working.

That a glowing, ruddy, perhaps uniform tone was habitual to him in these days, is proved by the "Christ at Emmaus" preserved in San Salvatore at Venice, under the name of Giovanni Bellini; a picture in which we neither notice Bellini's types, nor his feeling as a colorist, nor his line as a draughtsman. If we look at the contrasts of tints and their harmony, we detect the art familiar to Carpaccio in pitting one shade against another to make up the chord; there is no subtle agency at work to blend tints together, the flesh is not broken up or varied to produce effect. Warmth, on the contrary, is obtained by an even red film thrown over all, and without partial glazes.

This is the method of a painter whose mastery of the technical appliances is incomplete. A great colorist would never be obliged to complete his harmony by a general glaze warming the entire scheme, this being a rude device to cure a recognized crudeness.

As a story-teller Carpaccio has had no superior in the school of Venice, and perhaps none in Italian art. His imagination is wayward, subtle, full of minute inventions and happy surprises, and his originality is distinct and, in his most matured and characteristic work, almost separates him from the contemporary Venetian art, though in his methods he at times adheres to one or another of the teachers with whom he was associated in his early training. He leaves upon me the impression of an artist in whom the subject had always overpowered the art, in whom invention ran so far ahead of the power of delivery that he had no time to wait for his brush to do its work completely. To the dilettante who studies him completely, and who is not led aside from the

intellectual conception by the critical study of methods and technical mastery, he offers more intense satisfaction than some of the greater painters—a satisfaction which I must hold to be apart from the purely artistic standard. It is on this ground that Ruskin does him honor. Living and dying as he did in the midst of a community in which the technical appre-

ciation of art had been fed to the utmost by daily study of the greatest triumphs of color the world has seen, his life and his exit from it, as well as his works, attracted less attention than they merited. Thus it is that we know nothing of Carpaccio personally, and know not when or where he was born and died.

*W. J. Stillman.*

NOTES BY TIMOTHY COLE.

THE Carpaccio detail is taken from the large picture in the Venice Academy, which is itself one of a series of nine large works showing scenes from the legend of St. Ursula. The entire picture represents the ambassadors of the king of England before the king of Brittany to prefer their prince's request for the hand of his daughter Ursula. The compartment to the right of the picture, separated from it by a pillar and showing conventionally another room of the palace, is the detail that I have chosen. It is in itself a complete composition, and very charming it certainly is.

Much embarrassed, the king has retired from the council to his private chamber; for he knows that his daughter has made a vow of perpetual chastity and has dedicated herself to Christ, yet he fears to offend the powerful monarch of England by refusing his suit. He has delayed the answer till the morrow, and now sits meditating his reply. He leans his head upon one hand. The other, gloved, still holds the letter of the king of England. While in this mood his daughter Ursula enters, and, learning the cause of his melancholy, bids him be of good cheer, and proceeds to detail to him the conditions under which she will wed the king.

First, he shall give to me as my ladies and companions ten virgins of the noblest blood in his kingdom, and to every one of these a thousand attendants, and to me also a thousand maidens to wait on me. Second, he shall permit me for the space of three years to honor my virginity, and with my companions to visit the holy shrines where repose the bodies of the saints. And my third demand is [we can imagine the maid in the picture

as in the act of telling this, for she is touching her third finger] that the king and his court shall receive baptism; for other than a perfect Christian I cannot wed.

The size of the entire work is 8 feet 9½ inches high by 19 feet 3 inches long. That of the detail given is 3 feet 3 inches wide by 5 feet 6 inches high. It is painted on canvas, and is very rich and soft in color. It is broadly and simply treated, though upon close inspection we find it full of the most exquisite detail. The king's robe, for instance, is richly worked in embroidery too delicate to allow of engraving on so small a scale. I have stippled it, and have thus given some impression of its rich effect. It is of a glowing, soft tone of yellow like old gold. This is relieved against the white bedspread and the canopy above, which is of a rich, soft red. The background is warm gray, and appears to be of marble. Through the grating above is seen the ceiling of another room. The Madonna on the wall is enshrined in a yellow frame like gold. The casing of the window is of a soft, dull red, the book beneath it of a brighter red, and under all there is a charming dado of flowers. The head of the princess is relieved against a dark panel. Her complexion and hair are fair. She is clothed in a delicate, soft, neutral blue, draped with a mantle of rich, bright red. The combination of the whole is most harmonious and pleasing.

St. Ursula is the patroness of young girls, particularly school-girls, and of all women who devote themselves especially to the care and education of their own sex.

*T. Cole.*

## THE GREAT UNKNOWN.

In mare multa latent.

OPPIAN.

MR CHARLES LYELL, the eminent geologist, and a most intelligent observer of natural phenomena, while in this country asked his friend Colonel Perkins of Boston what he knew of the so-called sea-serpent. The latter replied, "Unfortunately, I have seen it." The guarded qualification of his remark betrays the chronic condition of wounded sensibility entertained by the eye-witnesses of the "strange occurrence" at that time.

Ridicule had dealt most bitterly with the gentle souls who in the innocence of their well-assured integrity had given a heartless world their simple "word for it." It was now a temptation to forswear, or at least to ignore, all knowledge of any strange creature, marine or terrestrial; though all the while, in mental reserve, they were ready to affirm with Galileo, "E pur si muove"; or, perhaps, with the righteous old negro preacher, in equal faith and with like spirit, to insist that "the sun do move."

Students of the present day have become so familiar with the remarkable remains of extinct reptilian forms, of species differing essentially in size and aspect from those of the present, yet evidently nearly allied, that it has come to be a rational and legitimate thought that

. . . Such things be,  
And overcome us like a summer's cloud,  
Without our special wonder.

It is a well-known scientific truth that races of terrestrial and aquatic animals now extinct,

proportions, correspond so nearly to the living ocean creature which has been seen in various parts of the Atlantic Ocean and is known as the "sea-serpent," that it is tolerably well settled among zoölogists that the existence of such an animal in the present geological time is not improbable.

Up to the present our recorded knowledge of such creatures, quite aside from the idle tales that periodically appear in print, has originated from the most respectable sources; and it is most fortunate that in several instances the observers chanced to be practical zoölogists.

DRAWN BY W. TABER.

WATCHING THE SEA-SERPENT.

but not far removed from some present living forms, were of the most surprising magnitude.

The examples of "findings" pointing strongly to the coetaneous relations of man and mastodon are accumulating with much significance. In the phosphate beds of South Carolina, and in the greensands of New Jersey, lie the bones of gigantic reptiles, cetaceans, and sharks. The "Bad Lands" of Kansas and the adjacent Territories teem with buried forms, all strange and all gigantic. The halls of Princeton, Yale, and Columbia, and the Central Park Museum of Natural History, contain many a "cross-bone" and cranium, pelvis and vertebra, whose restored relations would greatly astonish us. The great mosasaurs, plesiosaurs, ichthyosaurs, and numerous other sea-reptiles, whose bones are found buried along the Atlantic shores and represent creatures of gigantic

Small wonder, therefore, that the theme, albeit peculiarly susceptible to misconstruction, should be held by zoölogists as involving great possibilities.

It is the all but actual discovery lately of a great creature evidently allied to the "Unknown" that has prompted the gathering of these scraps of history appertaining to the subject.

Having been familiar with the early testimony concerning the appearance on the New England coast of the so-called sea-serpent, and having had personal acquaintance with some of the eye-witnesses,—now all passed away,—and having personal knowledge of the views

of the elder Agassiz, and some other eminent zoölogists, whose faith in the probable existence of such was well known, I have recorded from time to time any facts tending to elucidate the theme. Some recent developments, to be referred to anon, tended to strengthen the interest, and it seemed most advisable that whatever has borne the semblance of truth in the several remarkable testimonies should be brought to the archives of science for preservation.

At a recent session of the New York Academy of Sciences I had the pleasure of presenting a résumé of the subject, which was subsequently published in the Academy's "Transactions," with some appropriate remarks by the president, Dr. J. S. Newberry, and others, eliciting the fact that a general feeling exists favorable to the views herein expressed.

The subject is interesting, and tempts one to give a historical presentation, but the valuable pages of *THE CENTURY* cry aloud for conciseness. It is necessary, therefore, to present the historical connections "by title."

As in all that appertains to human book knowledge, Aristotle forms the starting-point of this history. Pliny follows, and tells some startling, if not altogether reliable, things. Then follow the usual learned authors whose ponderous folios and great copper-etchings, elaborate and costly, picture all that is told about sea-monsters with a latitude sufficient, perhaps, for the liveliest imagination.

Some of the later of the ancient authors speak of sea-serpents that inhabit the Indian Ocean and some parts of the Pacific. These records have been verified, but the length of the creatures is never more than twelve feet. It is now well known in scientific ichthyology that there are several species of the genera *Pelamys*, *Hydrophis*, and *Platurus* inhabiting the oceans mentioned, that they are true ocean-snakes, and are more or less venomous. Several small forms of the genera are in the collection at Central Park. The tails are flattened vertically, and serve the purpose of oars, "sculling" being their true method of propulsion. In the Catacombs of Rome several sarcophagi were found containing remains of early Christians. On one of the inscriptions is a likeness of a great serpent swallowing a man, though it is entitled "Jonah and the Whale." The oldest chronicler of "sea-serpent" lore, independent of the purely imaginary tales, is Olaus Magnus, Archbishop of Upsala, who devotes an entire chapter to the subject. Bishop Pontoppidan, whose "Natural History of Norway" is so well known, fills a notable place in the literature of

our theme. His descriptions and figures, so much like those of modern times, have been preserved in his great folio.

All the above-mentioned authors gravely refer to the fact that they have carefully procured "affidavit," and "from the proper authorities," but the requirements of science in those days were not hedged about by the keen

DRAWN BY J. SMIT.

HYDROPHIS CYANICINCTA.

ENGRAVED BY J. DALZIEL.

vision of profound, exacting research which obtains at present.

It is not altogether the fact that few or many good people subscribe under oath to what they have seen that can satisfy the modern zoölogist. It is the fact that the actual bony remains of precisely such creatures as have been described as "sea-serpents" are found in various places on our coast. It is this more than all else that induces a belief in the probable existence of similar creatures in the great depths.

Near the close of the second decade of the present century there appeared off the coast of Massachusetts Bay one or more strange creatures, differing essentially in general aspect from anything hitherto observed. They were evidently sea-going creatures, oceanic ones, and impressed all of their many observers as serpentine or saurian-like in shape and movements.

Colonel Perkins of Boston communicated his observations of one of these "appearances" to the "Boston Daily Advertiser" at the time.

Wishing to satisfy myself on a subject on which there existed a great excitement, I visited Gloucester, Cape Ann, with Mr. Lee. We met several persons returning who reported that the creature had not been seen during several days. We, however, continued on our route to Gloucester. All the town, as you may suppose, were on the alert, and almost every individual, both great and small, had been gratified, at a greater

PLATURUS FASCIATUS.

or less distance, with a sight of him. The weather was fine, the sea smooth, and Mr. Lee and myself sat on a point of land overlooking the harbor, and about fifty feet from the water. In a few moments I saw on the opposite side of the harbor, at about two miles' distance from where I had been sitting, an object moving with a rapid motion up the harbor on the western shore. As he approached us it was easy to see that his motion was not that of a common snake, either on land or in the water, but evidently the vertical movement of a caterpillar. As nearly as I could judge there was visible at a time about forty feet of his body. It was very evident that the length must have been much greater than what appeared, as in his movements he left a considerable wake in his rear.

I had a fine glass, and was within a third of a mile of him. The head was flat in the water, and the animal was, as far as I could distinguish, of a chocolate color.

There were a great many people collected, many of whom had seen the same object. From the time I first saw him until he passed by where I stood, and soon after disappeared, was about twenty minutes.

One of the revenue cutters, whilst in the neighborhood of Cape Ann, had an excellent view of the animal at a few yards' distance. He moved slowly, and at the approach of the vessel sank, and was not seen again.

In 1817, the Linnæan Society of Boston, Massachusetts, published a "Report relative to the appearance of a large marine monster, supposed to be a sea-serpent, seen near Cape Ann, Massachusetts, in August of that year." A good deal of care was taken to obtain evidence, and the depositions of eleven witnesses of marked integrity were taken. There was great uniformity in the testimony.

The Hon. Amos Lawrence, one of the most eminent of Boston's citizens, gave similar testimony from personal observation. His cottage

was situated on high ground overlooking the bay, within less than a mile of the creature at times.

Colonel Harris, commanding at Fort Independence, Boston Harbor, stated that such a creature had been seen and reported by his sentinels, while it was swimming around the fort in the early hours.

Many other accounts were stated and recorded, agreeing in the main with the above. I select that of Mr. Nathan D. Chase of Lynn, Massachusetts, as especially trustworthy and valuable from the fact that he was one accustomed to observe closely, and to record his observations in the light of much reading on semi-technical subjects. I am inclined to give unusual weight to his statement, also, from having known him intimately through life as a neighbor and friend, and, as such, having heard from him the "oft-told tale." The following refers to the second appearance of the sea-serpent, in 1819, at Lynn. In a letter written in 1881 for the purpose of conveying concisely all he knew of the circumstances, with reference to recording them, Mr. Chase says:

In relation to the account given by myself of a strange fish, serpent, or other marine animal, I have to say that I saw him on a pleasant, calm summer morning of August, 1819, from Long Beach, Lynn, now called Nahant. The water was smooth, and the creature seemed about a quarter of a mile away; consequently we could see him distinctly, and the motion of his body. Later in the day I saw him again off Red Rock. He then passed along about one hundred feet from where I stood, with head about two feet out of the water. His speed was about that of an ordinary steamer.

What I saw of his length was about sixty feet. It was difficult to count the humps, or undulations,

DRAWN BY J. SMIT.

ENGRAVED BY J. DALZIEL.

PELAMYS BICOLOR.

on his back, as they did not all appear at once. This accounts in part for the varied descriptions given of him by other parties. His appearance on the surface was occasional and but for a short time. The color of his skin was dark, differing but little from that of the water, or the back of any common fish. This is the best description I can give of him from my own observation. I saw the creature just as truly, though not quite as clearly, as I ever saw anything. I have no doubt that this uncommon, strange rover, which was seen by hundreds of men and boys, is a form of snake, Plesiosaurus, or some such form of marine animal.

Five other persons have given definite testimony

I have given, I was well acquainted with Mr. Marston, and knew him to be a truthful and skilled seaman. He says :

While walking over Nahant Beach in common with many others who had been aroused by the excitement, I saw in the water, within two or three hundred yards of the shore, a singular-looking fish in the form of a serpent. His head was out of water, and he remained in view about twenty minutes, when he swam off toward King's Beach. I should say that the creature was at least eighty feet in length. I saw the entire body, not his wake. It would rise in the water with an undulating motion, and then all his body would sink

DRAWN BY W. TABER.

FOLLOWING ALONG THE BEACH.

besides myself. Hon. Amos Lawrence of Boston, James Prince of Boston, Benjamin F. Newhall of Saugus, and John Marston of Swampscott.

(Signed) NATHAN D. CHASE.

The Hon. Amos Lawrence of Boston writes of the same occurrence :

I have not had any doubt of the existence of the sea-serpent since the morning he was seen off Nahant by old Marshal Prince, through his famous spy-glass.

Mr. Benjamin F. Newhall, one of those who testify to the same circumstances, was an especially reliable person, a citizen of the highest character, well known to me for many years, and one accustomed to observe correctly and to record his observations. He says :

As he approached the shore about 9 A. M., he raised his head apparently about six feet, and moved very rapidly. I could see the white spray on each side of his neck, as he plunged through the water. He came so near as to startle many of the spectators, and then suddenly retreated. As he turned short, the snake-like form became apparent, the body bending like an eel. I could see plainly what appeared a succession of humps upon the back.

The testimony of Mr. John Marston is of value as coming from an experienced fisherman. As in the case of the individuals whose

except his head. This would be repeated. The sea was quite calm at the time. I have been constantly engaged in fishing since my youth, but never saw anything like this before.

The eminent geologist, Dr. Dawson of Montreal, Canada, gives an instance which ranges near the above in the circumstances.

A sea-monster appeared at Maringomish, in the Gulf of St. Lawrence, judged to be a hundred feet in length. It was seen by two intelligent observers, nearly aground, in calm waters, within two hundred feet of the beach.

Several other prominent Boston and Lynn names are recorded in this connection, but the following is, perhaps, most important on account of its circumstantial details.

James Prince, Marshal of the district, wrote to Judge Davis as follows :

MY DEAR JUDGE: I presume I have seen what is generally called the "sea-serpent." . . . I will state that which in the presence of more than two hundred other witnesses took place near the Long Beach of Nahant on Saturday morning last.

Intending to pass a few days with my family at Nahant, we left Boston early on Saturday. On passing near the beach, I was informed that the sea-serpent had been seen that day at Nahant Beach, and that vast numbers of people had gone from Lynn. I was glad that I had with me my

DRAWN BY FREDERICK A. LUCAS.

CARCASS FOUND AT INDIAN RIVER, FLORIDA.

FROM AUTHOR'S SKETCH-BOOK.

famous masthead spy-glass. On our arrival at the beach, we associated with a considerable number of people, on foot and in carriages. Very soon an arrival of the fish kind made an appearance. His head appeared to be about three feet above water. I counted thirteen bunches on his back. My family thought there were more. He passed three times at a moderate rate across the bay, but so fleet as to occasion a foam in the water. We judged it to be from fifty to eighty feet in length. . . .

As he swam up the bay, we, as well as other spectators, moved on and kept nearly abreast of him. He occasionally withdrew himself under water, remaining about eight minutes.

Mrs. Prince and the coachman, having better eyes than myself, were of great assistance to me in marking the progress of the animal. They would say, "He 's now turning," and by the aid of a glass I could distinguish the movement. I had seven distinct views of him from Long Beach, and at some of them the animal was not more than a hundred yards distant. After we had been at the beach about two hours, the animal disappeared.

On passing over to the beach of Little Nahant, on our way homeward, we were again gratified by a sight of him beyond even what we saw in the other bay. We concluded he had left the latter place in consequence of the numbers of boats that were chasing him, the noise of whose oars must have disturbed him. We had here more than a dozen views of him, and each similar to the other; one, however, so near that the coachman exclaimed, "Oh, see his glistening eye!"

We will now place in order some testimony derived from English sources. That delightful English writer on zoölogical subjects, Philip Henry Gosse, F. R. S., in his "Romance of Natural History," devotes a long chapter to what he terms "The Unknown," or so-called sea-serpent. He gives us an exhaustive consideration of the subject, mostly, however, by means of European examples. We are impressed, however, with the fact that the occurrences of this nature, as related by the New England observers, are vastly more striking than the others, as they were witnessed from the mainland.

The eminent Captain Beechey, of the Royal Navy, gave testimony to the appearance of a

sea-serpent near his vessel. Several officers of the Norwegian navy have placed on record similar testimony. A writer of distinction in the London "Times" of November 2, 1848, suggests affinity of the so-called sea-serpent with the *Enaliosauria*, and, particularly, with the fossil genus *Plesiosaurus*. The Bombay "Times," in the year 1849, contained a valuable note of occurrences touching this subject, by R. Davidson, Superintendent-Surgeon, Indian Army, Lieutenant-Colonel Steele, Coldstream Guards, British Army, *en route* to India, "saw a serpentine form corresponding closely to those described by other observers."

Mr. Gosse sums up by saying: "Carefully comparing these independent narratives, we have a creature possessing the following characteristics: The general form of a serpent, as seen by many observers; great length, by all"; etc. The author continues, after considerable detail: "I express my confident persuasion that there exists some oceanic animal of immense proportions which has not yet been received into the category of scientific zoölogy; and my strong opinion that it possesses close affinities with the *Enaliosauria* of the Lias."

That some undescribed vertebrate animal has been seen at various times, and by many individuals, several of whom fortunately were versed in zoölogy, is indisputable.

The presence of so large a creature off the New England coast, and within the comparatively narrow bays of Lynn and Nahant; the fact of its presence there during several days, and its being visible during many hours; its presence near so many people as spectators,—well nigh the entire populace,—who even without glasses were enabled to inspect it at leisure—all these are circumstances sufficiently convincing to any rational mind; and are worth more to us in forming our judgment than all the other relations of such occurrences extant.

Consider how striking must have been the scenes during these few days. The entire population of southern Essex and Norfolk counties was aroused by the wonderful tales, and great numbers gathered on the heights and promontories, looking down upon an area of sea which

DRAWN BY FREDERICK A. LUCAS.

FROM REPORT OF U. S. GEOLOGICAL SURVEY, 1875.

SKELETON OF THE CLIDASTES, FOUND IN THE BAD LANDS OF KANSAS.

is hemmed in by the projecting headlands of Swampscott and Nahant. How completely they must have scanned the unfamiliar form, and have watched its evolutions in the smooth sea then prevailing. Why, no better exhibition of a great aquatic creature could have been devised. All the ocean views of him, described by many observers, were meager and unsatisfactory compared with this. The relation of these circumstances remains fresh in my memory, told by more than one who only a few years before had witnessed them. An uprisen people saw the sight, and some were even terrified, so close inshore was the monster. It should also be remembered that the creature was seen at Gloucester, Cape Ann, and at several other points during those years.

Only a few years since large *Octopi* were found in the Mediterranean, and now, were the simple truth here printed about the late discoveries of gigantic squids, or cuttlefish, on the Grand Banks, surprise would be great indeed. If such enormous creatures have existed, and only lately have become known to science, small wonder that the more active wandering ocean saurian should escape capture.

We have now to make the first record of the actual presence on our coast of a marine—probably saurian—creature of the nature of the so-called sea-serpent.

The facts are as follows:

In the spring of 1885 the Rev. Mr. Gordon of Milwaukee, President of the United States Humane Society, chanced to visit, in the course of his duties, a remote and obscure portion of the Atlantic shores of Florida. While lying at anchor in New River Inlet the flukes of the anchor became foul with what proved to be a carcass of considerable length. Mr. Gordon quickly observed that it was a vertebrate, and at first thought it probably a cetacean. But, on examination, it was seen to have features more suggestive of the saurians. Its total length was forty-two feet. Its girth was six feet. The head was absent; two flippers,

or fore-limbs, were noticed, and a somewhat slender neck, which measured six feet in length. The carcass was in a state of decomposition; the abdomen was open, and the intestines protruded.

The striking slenderness of the thorax as compared with the great length of body and tail very naturally suggested to Mr. Gordon, whose reading served him well, the form of some of the great saurians whose bones have so frequently been found in several localities along the Atlantic coast. No cetacean known to science has such a slender body and such a well-marked and slender neck. All indications were suggestive of the great *Enaliosauria*, and, appreciating the great importance of securing the entire carcass, Mr. Gordon had it hauled above high-water mark, and took all possible precautions to preserve the bones until they could be removed. Through his love of science, Mr. Gordon very kindly reported these facts, and our arrangements were most ample for the recovery and transportation of the bones to New York. Most unfortunately their presence was all too short.

Mr. Gordon was impressed with the conviction that he had found the first flesh and frame of the hitherto elusive creature, which has been regarded as a tardy example of an extinct race. With no suitable implements at hand, he was obliged to trust its safe-keeping to the shore above tides. He counted without the possible treacherous hurricane; the waters of the "Still-vexed Bermoothes," envious of their own, recalled the strange waif. This was as unexpected as undesirable. The facts, however, remain.

We have borrowed from Professor Cope's report of the United States Geological Survey for 1875 the figure of the *Chidastes*, the bones of which were found in the Bad Lands of Kansas. It is placed beneath the figure drawn from Mr. Gordon's description of the waif. The measurements of both are very nearly the same.

J. B. Holder.

## THE GIRL AND THE PROBLEM.

WITH PICTURES BY F. V. DU MOND.

"T'S a great problem, of course," said Miss Nancy Randolph Rutledge, folding her hands in front of her portly person, "yet I can but feel that in this case Beulah has chosen wisely. Genius has more rights in some ways, and in some it has less. She should n't feel that she is free to fold her talent in a napkin; she does n't."

"No, no," murmured little Mrs. Garner; "but it seems mighty hard, and—and difficult, does n't it? Do you think she minded giving him up very much? They had been engaged so long," she added apologetically.

"She's absorbed in her art," replied Miss Nancy, impressively; "her life is consecrated to it."

The pair were sitting in Miss Nancy's flat in 97th street, and the room in itself was a biography. The walls were hung with what Miss Nancy called (and I capitalize according to her sentiment) Ancestral Portraits—five of them, and wonderful things they were. In one corner was a tiny, brown old Érard piano, the first Érard ever made, I should think. It was still capable of sending forth an odd, pleasant eighteenth-century-like tinkle. Some battered old pieces of silver, a cake-basket and a tea-pot taking the honors, stood in solemn dignity on the elaborate, shiny, new hard-wood mantel-piece.

Miss Nancy Rutledge was an elderly and unmarried lady, but if you allow yourself to turn toward her any of your usual slighting and condescending sentiments for spinsters, you are offering her the first patronage she ever received in this world. Miss Nancy, in the kindest, most unconscious way, patronized creation. Never out of the South was an unmarried woman so generally and simply allowed precedence over all matrons as was given Miss Nancy in her own world. It was not that these Southerners loved marriage less,—far from it,—but that they loved intellect more; and intellect was what Miss Nancy tacitly and firmly claimed to have, was supposed to have, and did have, the amount thereof in question declining slightly with each successive step of this statement.

Miss Nancy had come north to live off the enemy amid the prayers and plaudits of admiring friends, and their prayers and plaudits had echoed around her throughout the five years in which she had gallantly triumphed

over bankruptcy in New York. In that time she had played many parts: she had written for the papers; had taught mathematics in a school; had assisted in the editorship of a new and impecunious paper devoted, as its title-page stated, to developing the resources of the South; and had given lectures on the history of Virginia in the parlors of some rich people who could never forget—though sometimes sorely tempted—that they were born south of Mason and Dixon's line; and of late, in the midst of work upon a life of General Lee, for the Southern subscription trade, she had found a new resource in the care of a small proportion of that army of Southern girls which is now constantly encamped among us. She had three in the house with her, and devoted some attention to several living elsewhere. The office of chaperon suited Miss Nancy; according to her all her girls were lovely,—most of them beautiful, "perfect belles at home,"—and the pleasure of devoting her stores of garnered wisdom to their service renewed her joy in life. She was benevolent, sincerely so, and believed, with a good showing of reason, in her power to guide and instruct humanity at large, and also was humanly susceptible to the charms of appreciation. The very groundwork of Miss Nancy's claims was common sense; you could see that in every line of her matronly figure, and hear it in every note of her pleasant, hearty voice, and in her large-featured face and bright gray eyes common sense was enthroned.

But, contrary to popular prejudice, human beings are constantly rendered unknown quantities by the possession of quite contradictory qualities, and Miss Nancy, to tell the truth, had been subject in her life to a few enthusiasms which left her common sense—sometimes for better, sometimes for worse—far behind. One among those young ladies whom she now called "her girls" was the object of a veneration that must be considered to have had its rise in the romantic, the higher, side of Miss Nancy's nature. She had known her since she was in long clothes, but not till about a year before this conversation with Mrs. Garner did she honor her with more notice than lay in that general, amiable patronage of which I have spoken, and which she constantly dispensed about her like a perfume—bergamot, say. This girl was, of course, the heroine of Mrs. Garner's speculations, so you already know

that she had genius, an art, and a lover—a decent equipment, I take it, for her position as my heroine.

A little more than a year before, Miss Nancy had visited Beulah's mother, and during that visit she had conceived an entirely new idea of Beulah, like every other Southern girl at home, was generally—according to the formula—voted mighty sweet, and right pretty,—that is, pretty a little,—but it was only recently that she had developed any special claims to distinction. Now Miss Nancy found that she was an artist, not fully fledged perhaps,—oh, no; to be sure not,—but unmistakably an artist; and to that title, which Miss Nancy gave only to painters and sculptors, she bowed with the most curious and common blind reverence in the world. It would be impossible to exaggerate the simplicity of Miss Nancy's attitude toward these arts; in a word, it was of that familiar sort which feels an oil-painting to be an oil-painting, and a very imposing thing too. Of course Beulah did not make oil-paintings; with all her genius she had not yet arrived at that stage—but let us go back for a moment to the beginning of her artistic career.

When the Baptist Female College of her town added a new drawing-master to its "faculty," several young ladies of society, Beulah among the number, had been moved by the fame of his accomplishments so far to renew their connection with the school as to take a course of lessons from him. Beulah had always had clever fingers; she had done beautiful "tattooing" when she was only a little girl, and now she distinguished herself in the drawing-class; she was soon drawing her own embroidery patterns, and beginning her ascent of that pinnacle of fame on which ere long she was to sit enthroned. She enjoyed this new outlet for her abundant energies, and in the nature of things she enjoyed the new consideration she won. She began to feel a certain tradition-born awe of her own gifts. Her position toward art was exactly Miss Nancy's own; she felt for it, or rather for the name, the superstitious, unsympathetic veneration which some philosophers explain as a result of art's dependence on religion in the middle ages. At any rate, when Beulah found herself making a recognizable sketch of the water-pitcher,—for the new master was very advanced, and insisted on study from the object,—her heart palpitated with the magnitude of the dreams of glory that floated in upon her mind. Then came Miss Nancy. Miss Nancy gazed upon the water-pitcher and the flower-embroidery patterns with profound emotion. She urged Beulah to come to New York and have the best instruction, and finally Beulah came. By chance she fell upon the plan of going to the Art Students' League; and now she had had

one season's instruction there, and was beginning her second year.

Naturally within this year her ideas had undergone some changes, but for the greatest change of all—the determination not to marry Tom M'Grath—the League could hardly be held directly responsible. Southerners have a pleasant reputation for friendliness with strangers, because they so readily suppose others to be "nice people," various evidences of niceness being more conclusive in the old Southern world than they are at present in New York; but if Southerners do not feel sure that you are of their own kind, if they are even puzzled as to where you belong (according to their remarkably simple ideas of classification), they are little likely to be friendly, not being apt to care for social experiments. All this is but a preface to the statement that Beulah had scant acquaintance with her fellow-students. She thought the young women generally given to queer clothes, and that the young men lacked what she called "polish"; polish in her language meaning—though perhaps she had never thought of it—deference to women. So the dear girl let her social chances for League associations, with all their educational influences, slip by her in the gentlest, firmest little way in the world—in exactly a nice nineteen-year-old way, in fact. She was a dear girl, and she showed it in failing to become utterly insufferable under the adulation that now—away from the League—surged around her. This it was that might be said to have brought about the momentous change I have spoken of—this adulation and Miss Nancy's hearty and insistent fostering of all the dreams it excited. Miss Nancy had just been explaining Beulah's present position to Mrs. Garner. Mrs. Garner was a friend who lived in Beulah's home county, and was now visiting New York.

"She took a great many sketches home with her last summer," said Miss Nancy, "and everybody was astonished. I reckon a great many people felt that it was a great pity to see a girl with gifts like that just settle down into the ordinary humdrum."

"The duties of a wife and mother," began Mrs. Garner, with slightly agitated solemnity—she was very humble with Miss Nancy, but the "ordinary humdrum" was a phrase that provoked even her to turn to the arsenal of platitudes for a weapon. She had it in her heart to try to remind Miss Nancy that the most important offices of life were the very ones she had never been called upon to fill.

But little could she cope with Miss Nancy, who, secretly amused, swam beneficently on with the conversation, wishing to soothe the little woman's feelings, and without the faintest conception of the complexity of her senti-

ments—“The duties of a wife and mother are sacred, Molly; but without her art Beulah, though she is a sweet girl, might likely enough be a humdrum person. I don't think she has the feeling for duty that you have, for instance, and that you always had, Molly; but her art lifts her above herself. For a long time she seemed to have less feeling about her talent than her friends did; but I talked to her—I did that much. I would not urge her one way or the other about her marriage, but I wanted her to realize what a great trust a gift like that was, and to make her choice solemnly. It is n't even as if Tom M'Grath were going to live in Virginia; in Texas she will be out of the way of instruction, and of all those associations that would stimulate her and give her something to work for. And then we know, under the best of circumstances—” Miss Nancy shook her head and sighed. Despite expressed views as to its desirability, in her secret heart she really could but look on matrimony as an abyss that swallowed up many high hopes; in her day she had put such a deal of enthusiasm into teaching girls who—got married.

“So she made up her mind?” said Mrs. Garner, with a suspended inflection.

“Yes; at last. Her pa and ma did n't urge her one way or the other. I think Mrs. Hunt herself would a little rather she had married—she's very conservative, you know; but Mr. Hunt never wanted her to, anyhow, and they both felt the responsibility of the great future there was before her. I reckon she settled it just before she came back.” And then it was that Miss Nancy had admitted the harmonizing of woman's development and woman's sphere to be a great problem.

Presently Beulah entered; she was just home from her work at the League rooms, and had a sketch-book under her arm. Mrs. Garner got up to greet her in a little flutter of excitement.

“O Beulah, you've become a great woman since I saw you.”

Beulah stooped a little to kiss her, and said serenely, “I'm just beginning, Miss Molly.”

“I so long to see some of your wonderful things. You'll show me some, won't you?”

“You are very kind; I'll be delighted to,” said Beulah, and, excusing herself a moment, she went to her room, laid aside her coat and hat, ran a comb through the dark curls on her forehead, powdered her face afresh, and then without loss of time got out an armful of sketches and studies from the bottom of her wardrobe, and, smiling and polite, walked back to Mrs. Garner. She sat down beside her, drew up a chair to rest the pile upon, and showed them all to her, conscientiously, one by one, telling her in the mean time which were the hour sketches, and which had had a favorable

word from her teachers—telling, in short, in the most instinctively calculated manner all the things that Mrs. Garner would understand as reflecting credit upon herself.

“This girl did n't have a very nice complexion, did she?—that's why you've made it so dark and reddish, is n't it?” said Mrs. Garner, hesitatingly, after various half-articulate murmurs of admiration. She could not repress a little automatic effort to find out why these things, which were so much less pretty than the pictures in an illustrated weekly, were so much more wonderful, a fact she never dreamed of questioning.

“Oh, no,” said Beulah; “she had a very nice complexion, but the light was not strong on it, and then you see these things are done in such a hurry we only try to get the figure, the action.”

It did not annoy her in the least when people did not understand; she liked to explain a little, and she never doubted their admiration—their admiration of her for making the pictures. She was quite astute enough to feel that the admiration of the things themselves was not always a spontaneous burst; it did not disturb her that many of her friends suffered a little disappointment with themselves over the dullness of their sensations before real hand-paintings; she realized that the tradition of their value remained unshaken.

Mrs. Garner looked at the last drawing, and then leaned back and gazed with emotion upon Beulah—Beulah looking so pleasant and simple behind the collection of her complete works.

“It's very wonderful—wonderful,” Mrs. Garner murmured, shaking her head slowly, and thinking of more things than one.

Beulah smiled sweetly.

“And it makes you very happy, does it, dear?”

Beulah detected a thread of curiosity in the question that she resented, but she still smiled as she rose with the works on her arm, and said:

“Yes, indeed, Miss Molly; I could not be happy without my art.” And Miss Nancy nodded her approval.

Life went on serenely in our household for several months after this. Southern visitors continually dropped in, and all, like Mrs. Garner, were treated to a sight of Beulah's productions. Miss Nancy called for them if no one else did, and she was apt to give an awe-inspiring hint, when Beulah was out of the room, as to the sacrifices the girl had made for her art's sake. After a while a change began to show in Beulah; she worked harder than ever, she painted early and late, and she grew more and more silent, and on Sunday, when she could not paint, more and more restless. She was no longer content to hide her story-book in her lap for solace while she dutifully and

“IT'S VERY WONDERFUL—WONDERFUL.”

ENGRAVED BY H. DAVIDSON.

patiently sat and preserved the look of listening through long chapters of Jeremiah read aloud by short-sighted Miss Nancy.

"I'm afraid, Beulah, my child," said Miss Nancy, solemnly, one morning, stopping and laying her open book upon her lap—"I'm much afraid you are letting your delight in an earthly gift and your love of an earthly art draw you away from your interest in things eternal."

Beulah had been fidgeting from one window to another, after having three times found excuses for leaving the room; now she still stood at a window, and answered, without turning around, "I'm afraid I am, Miss Nancy." But afterward she sat down and remained quiet through the next chapter, though sustained by no other distraction than her own thoughts. To do Beulah justice, she was always willing to do as much through one chapter; that, she said, she had been raised to.

Miss Nancy had not expressed her fears fully. What she said to Beulah was what she said to herself, but down in the depths of her being lurked a faint uneasiness that she did not acknowledge. It was very annoying the way one person and another began to remark that Beulah was not looking well, that she was losing flesh. How could she look well when even after dinner, at home, she got out paper and charcoal and fell again upon the work that had occupied her all day? Genius, of course, often did burn itself out in that way, but she had always felt that she had reason to hope Beulah was better balanced. She was so far shaken out of her usual noble poise as to protest crossly, several times, against so much work; but one night after one of these scoldings she heard the girl walking up and down in the drawing-room till three o'clock in the morning, and instead of the sense of intolerant outrage with which she would usually have greeted such a performance, an odd forbearance fell upon her. After a month in which Beulah's appetite and color did not improve, Miss Nancy got a letter in which, among other bits of gossip, she read this: "Mary has had a letter from her nephew from San Antonio, and he says he has heard that Tom M'Grath is courting a girl in Houston; that people think it will be a match."

Miss Nancy's heart lightened; if you will believe it, she thought to herself that now Beulah's pride would come to her rescue, and make her forget a man who had so soon forgotten her. This hope was her first admission to herself of her fears, and you see from it that Miss Nancy had exalted ideas as to the offices and possibilities of womanly pride, and also that she had the usual feminine and profound attachment to the most romantic ideal of constancy—constancy under the most discouraging circumstances—for men. She meditated on how

easily and lightly to put before Beulah the base fickleness of the discarded one, but the more she thought about it the less she knew how to do it. If ever there was an old maid in every fiber of her being it was the hearty, wholesome, large-minded Miss Nancy, and consequently her theories of love and love-affairs were of the most assured, definite, comprehensive character; but there was something about Beulah these days that gave her pause, and for once in a lifetime penetrated her soul with an unacknowledged but dreadful doubt of her own complete understanding of all the mysteries of human life.

Before she found a way to speak to Beulah of Tom M'Grath's lightness she got a letter from Beulah's mother mentioning the same subject as a hearsay report, and adding that she had written of it to Beulah—why, she did not say, and who knows?

The day that this letter came Beulah did not come home to dinner. It was eight o'clock when Miss Nancy heard the door of the flat hall open, and, hurrying to the parlor entrance with unaccustomed speed, saw Beulah dragging herself wearily into her own tiny bedroom. A feeling of relief was succeeded by a righteous and tempered indignation in Miss Nancy's heart. She had not intimated to the other girls that Beulah's absence was to her unexpected; on the contrary, so far as was consistent with her ideas of Presbyterian doctrine, she had intimated exactly the other thing. She was disposed to maintain something like boarding-school discipline over her girls, and they, she well knew, with their associations, were all too likely to imbibe the odious doctrines of youthful feminine freedom with which the dreadful Sunday papers reeked. She now thought that to go at once and speak to Beulah alone would be the best way of maintaining discipline. She knocked at the door, and, immediately opening it, found herself face to face with a very white, wide-eyed young woman, who stood in front of her chaperon as if barring the way.

"Beulah, my dear child," began Miss Nancy, in her most sadly serious way, her hands resting upon her stomach, "I cannot feel that this evening you have treated me or my household with the respect that is my due, and I feel that it is for your own—"

"Because I did not come home to dinner?" Beulah broke in, in an unfamiliar, hard voice, and without the slightest apparent consciousness of the rudeness of her interruption. "I beg your pardon; I am very sorry."

"Where have you been, Beulah?" said Miss Nancy, still trying to live up to her standard of an ideal disciplinarian.

"Been?" Beulah repeated, pushing her hair away from her forehead, and looking through

space. "I don't know; oh, I have been walking." She brought her eyes back to Miss Nancy's, and then added quickly, "I had my lunch very late; I don't want any dinner. I have been taking a little exercise in the park."

This explanation was a small concession to duty and decency, to be sure, but Miss Nancy's well-trained ear was conscious of a singular indifference in the girl's tone. She was uncomfortable, she felt like retreating, she did retreat; but not till she had covered that move by saying: "Very well, Beulah, but I don't expect this to occur again; it is not proper conduct. I will go and fix you a plate of bread and butter, and make you a cup of coffee, and bring them to you. It is my duty"—raising her voice a trifle in answer to Beulah's impatient wave of protest—"to see that you do not injure your health by your own—your own folly. I shall expect you to eat something."

Miss Nancy's inward sense of weakness had driven her into an irritation uncommon with her. She was now moved to martyr herself to arrange the little lunch instead of asking the servant to do it. When she returned with a tray in her hand she opened the door without knocking. Beulah was seated on the floor with her writing-desk in her lap; she closed it as Miss Nancy came in, but for a moment she did not get up. When she awoke to the demands of courtesy she fulfilled them rather scantily, and Miss Nancy carried herself out with unsoftened dignity. She did not disturb Beulah again that night, although she kept an eye on the girl's transom long after she herself went to bed, and at one o'clock saw the gas burning in that room with the complex emotions of a householder, a guardian of youth, and a good woman who, despite herself, feared that a great mistake had been made, and that she shared the responsibility for it.

During the next week her uneasiness declined; life went on comfortably enough. Beulah worked hard, but she ate her meals and talked to people, and altogether behaved more like a Christian than she had done in a long time.

"Thank heaven! that girl has come to her senses," said Miss Nancy to herself, and her complacency as a guide, philosopher, and friend renewed its strength like the eagle. But the week after this did not begin so well. On its last day Beulah came home at three o'clock in the afternoon, a very unusual thing. One of the other girls met her as she came in and exclaimed about her white face. A minute later she heard a heavy fall in Beulah's room and, rushing in, saw her, looking so pitifully slight and young in her sore trouble, lying unconscious on the floor. When Beulah came to herself she would say nothing

to any one. She simply lay there, white as her pillow, with her eyes shut, shaking her head sometimes with a little suffering scowl when she was spoken to. Miss Nancy was absolutely cowed; she was too far gone to put down the little buzz of sympathetic and interested gossip going on around her, for you may be sure these other girls had their ideas of the trouble, though, to do Beulah justice, she had made no confidences, and was temperamentally attached to the dignity of secrecy.

But the time had come when her well-ordered personal reserve was to break down. One of the girls—the one she liked best—was detailed to sit with her, and when Miss Nancy stole away from the eye of man, and the other went about her affairs, the little nurse laid her curly head down on the foot of the bed and broke into tearful sobs. It was a most heterodox thing for a nurse to do, but Beulah opened her eyes, and then held out her arms, and as the two young things clasped each other, she fell into a wild weeping that was the most merciful thing in the world.

"I knew it would come, I knew it, Patty," she cried at last in a loud, strained whisper—"I knew it. I knew I'd suffer like this some time. I did n't at first; I did n't mind. I did n't feel as if I cared about being married. They said I'd be a great artist; I wanted to be, but I knew this would come. I did not say it to myself, but I knew."

After a while she talked a little more calmly, and poured into Patty's small, palpitating bosom a deal of innocent young history.

"We'd been engaged ever since we were nothing but children," she said, holding tight to Patty's hand, and drawing herself toward her, as if she felt that in some way Patty might help her. "He wanted to be married before, but I thought I'd rather be a girl a little longer; and then came the painting, and Miss Nancy and everybody said I'd—oh, what does it matter, what does all that matter? When you are engaged a long time like that you get to think you don't care so much, but it's only because 'way down you care more. And Tom never said a hard word to me; maybe he did n't mind—but he did, oh, he did then. Why should he remember, when I could do such a thing?"

Wide-eyed Patty opened her brave little mouth to speak, and the way Beulah half raised herself, leaning forward with eyes straining to read what she should say before the words were formed, was a heart-sickening revelation of distraught, hopeless hopes of help.

"Tell him, tell him now," whispered Patty; but she was frightened enough when Beulah flung her hand away, and, burying her face in the pillows, sought to stifle a burst of hysterical cries. When she could Beulah pressed her hand

"HOLDING TIGHT TO PATTY'S HAND."

an instant again, but begged her to go away — go away, and make everybody leave her alone.

The next morning when Miss Nancy went in and found her still lying as she had left her, but with open eyes that some way looked as if she had not closed them through all the night, she said that she must send for a doctor. Beulah turned her head, looked at her, and then said very distinctly:

"Miss Nancy, you must not send for a doctor till I tell you to. When I can I'll see one, if I need; but I have got to manage my own life now. Please leave me alone. Thank you for your kindness." And she turned her face to the wall.

Miss Nancy could only pulse with an indignation that her other emotions were powerless to override; but she had an indefinable fear of a conflict, and she went away and stayed away. Beulah lay there silent all day. It was after dinner when Patty, going into the dimly lighted room again, heard her speak.

"Patty," she said, in a wooden, steady voice, "I have written. That's what's so terrible."

"When?" asked the intelligent Patty.

"More than two weeks ago."

"All sorts of things happen to letters."

"Not really, not in thousands and thousands of times. Why should he answer me? I knew he would n't."

"He will," said Patty, with the inflection proper to an axiomatic statement.

"Do you think so — do you, Patty?" Beulah, the elder, the genius, the once self-contained, kind mentor of the younger girl, spoke now as if Patty were an oracle of heaven.

Patty was equal to the position. "I know it," she said. Then, as Beulah's eyes besought her for more, she went on: "Probably he was away, and did n't get the letter for some time, and then probably he set in to arrange to come right up North to see you, and did n't think about writing. Men do like that; pa does. Why, maybe he's coming now; or maybe he's gotten here to-night after it seemed too late to call on you, and is waiting till in the morning."

Little did Patty realize, in her infantine castle-building, what she was laying out for herself.

"Do you think so?" cried Beulah, softly. Then she said in a voice more like every-day life, but vibrating with suppressed excitement, "Where is Miss Nancy?"

"In the dining-room."

"No one else there?"

"No," said Patty, wondering.

"Come," said Beulah, getting up and catching at Patty's shoulder for support.

"Oh, you must n't!" wailed the little girl.

"Be good to me now; help me, Patty," said Beulah, starting for the door; and then Patty went with her to the dining-room.

Beulah propped herself against the table when she got there, and Miss Nancy started toward her, forgetting her grievances, and crying affectionately: "My child, my child!"

"Please sit down, Miss Nancy; don't let me give any more trouble than I must. I know I am fearfully selfish now. I can't help it. No, I can't sit down, not now; in a moment. I am going to be more selfish than ever."

Beulah had spoken with self-control, but now her legs seemed to give way under her, and she sat down upon the floor, and with all her effort she could not get her breath without a gasping struggle.

"You'll think I'm crazy; so I am, mighty near, but I'm trying to get hold of myself; I will, Miss Nancy; only do something for me." She was speaking faster and faster, but with breaks and pauses, catching hold of the other woman's dress, after imperiously stilling all effort to stop or lift her.

"Oh, do one great thing," she hurried on; "go to the hotels—and see if Tom M'Grath is here." She bent her face into her hands. "Don't do anything but just that: find out if he is here, and if I know you are doing it, that you've done it, whether he is or not, I won't lose my mind." Her voice sank in a whisper.

Miss Nancy had already been saying, "Yes, yes, Beulah," and now she lifted her up, assuring her that she would start at once, and Beulah lay down upon the old sofa, where Miss Nancy thought she would get a rest from her own bed. But she had one more thing to ask.

"I want Patty to go with you, Miss Nancy," she said.

"My dear child, I cannot," Miss Nancy began.

"Miss Nancy," Beulah interrupted, "I can't let you go alone; you can't take Anne if she's out; please take Patty with you; she'll be willing to go, I know she will. It's bad enough to have you go. I'll never get over the shame of it; how can I stand it if you go alone?"

Just then Patty, who had stepped out of the room, returned, and Beulah appealed to her. Yes; she would gladly go with Miss Nancy.

"Very well, then," Miss Nancy agreed, in a muffled manner, and disappeared. She had gone so far in reversing all her ideas and standards that a little more or less did not matter much; but she was embarrassed at the loss of her own identity.

When she was gone Beulah called Patty to her, and, holding her hand hard between both her own, said: "Patty, you are not to let her—" she stopped and her face flushed—"you are not to let her—let Mr. M'Grath know—if you should find him. You know how a woman would feel, don't you?"

Patty solemnly nodded her whirling young head.

"Miss Nancy does n't," Beulah went on. "She just thinks about what's proper, and she's too scared now to care about that, or she would n't go. But I could n't live and have Tom know,—that is, have him think I meant him to know,—you understand. Keep her from—exposing me, Patty," and Beulah sank back upon her sofa.

So you see what faith Beulah put in those views of womanly pride and dignity which we have seen her disappoint.

In a few minutes Miss Nancy, not knowing in her ignorance how wildly hopeless a search she was beginning, started out with Patty into the stormy March night, upon her mission.

With what dignity of mien Miss Nancy quelled the hotel clerks; with what persistence she pursued them; finally with what helplessness she succumbed to the madness of the chase, under the hallucination that by a sufficient display of determination she could force Tom M'Grath to materialize—all this in time came to be recounted by Patty with gusto; but on this night her relish of it was slight, and before they came home, at three o'clock in the morning, she had fallen into a weary, dream-like apathy. From this you will infer, correctly, that their efforts were fruitless. Beulah heard this in silence, and silence she maintained.

Miss Nancy now contemplated the step she dreaded most—sending for Beulah's mother. But here again she was paralyzed by fear of the girl's stubborn resistance, and dread of the effect opposition might have on her. Never before had Miss Nancy viewed self-will—outside of herself—as aught but something to be righteously and immediately put down; never before had she doubted her power to put it down in any one subject to her authority legally or spiritually. Now her soul was full of darkness. The next morning while she was lying down, and Patty was sleeping, the door-bell rang, and the servant brought a telegram to the girl who was in the parlor pretending to study, but who was really reveling in bewildered, sympathetic, delighted speculation upon the household tragedy. The telegram was for Beulah, and she carried it to her pleased with the chance of entering the forbidden chamber. Beulah did not answer when she rapped; she went in, and Beulah did not stir till she heard the word "telegram"; then she sat up and tried

to open it, but it fell from her shaking fingers; she picked it up and tried again; she could not command the clever little hands whose skill had wrought her all this woe. With an effort she held out the envelop to the other girl. "Read it," she said.

In a twinkling it was open, and she heard these words:

"Been on ranch. Am coming to you. On road now. Tom."

"Thank you," said Beulah, with sweet civility, taking the telegram. "I am so much obliged; a telegram is so alarming, you know, and then it's always nothing at all," and she smiled, though her breath was coming a little hard, and nodded a polite dismissal.

In half an hour she came out of her room, clothed and in her right mind, and sought Miss Nancy. Kissing her cheek, she said:

"I feel very much better, Miss Nancy. I am so sorry for all the trouble and anxiety I have given you. You've been so good—I shall never forget. Is Patty up? Poor little Patty, I must go speak to her." Then from the doorway: "I've just had a telegram from Mr. M'Grath, Miss Nancy. He's on his way to New York," and she disappeared.

And then Miss Nancy at that late day learned the real aptness of the worn old phrase about being torn by conflicting emotions.

Between this time and that of Mr. M'Grath's arrival, Beulah, after all her storms, found herself moved to sit down over her sketches in tender contemplation of the glories she was foregoing, the glories of personal aggrandizement, though she never thought of putting it that way. In the secret chambers of her mind the phrase about "all for love and the world well lost" reiterated itself with a pensive, sweet personal application, and she sighed occasionally out of the fullness of her joy of sacrifice.

Meanwhile she was missing her classes at the League; but it happened, for a wonder, that her name came up between two of her teachers there, in a private discussion of their sorrows.

"Life would be more cheerful," said one young man, "if being D. F.'s did n't seem to insure their turning their attention to art. They undertake it not only when they've no eye, and no feeling, but with broken matches for fingers."

"I don't think those are the worst," said the other. "They don't get out into the light to do much harm. I hate 'em worst when they've got the fingers and nothing else, and are ready pretty soon to help fill the maw of the Philistine. There's that Virginia girl I pointed out to you—Hunt's her name, I believe. She has n't an atom of talent, or even real intelligence about art—no color, hopelessly bad in

her drawing, but she's got a sort of superficial facility." And he went on condemning Beulah, whose self-satisfaction had roused his ire, to a life that he declared below an honest washer-woman's in dignity.

When Mr. M'Grath arrived, before he had been in the parlor twenty minutes he wanted to take Beulah out walking—to the puzzled vexation of the ladies who had vacated it for the lovers' convenience. Beulah came to the dining-room where the household was assembled, as self-possessed as ever, and asked Patty to go with her. Miss Nancy could only snort feebly, so cowed was she by all that had passed; and when Beulah said that Tom was most anxious to meet her, though he was in something of a hurry just now, and that he hoped to see her in an hour or so, when they all came back, she put on a mollified air, and counseled Patty to go.

While they were putting on their hats, Beulah said, as she carefully adjusted hers, and, with her eyes on the mirror, stuck in a long pin:

"Patty, I don't think Miss Nancy would be quite so horrid as to tell Tom anything,—to talk to him about things, you know,—do you?"

"N-o-o," said Patty, staring at the face in the glass; "I'm sure she would n't."

"I reckon I'll just not give her much chance," said Beulah, abstractedly, as she put on her gloves.

When they returned Mr. M'Grath was introduced to Miss Nancy. He was a tall young man with a firm-set mouth, pleasant dark eyes, and a broad soft hat.

"Now I'll return the favor," he said, when his acquaintance with the lady was properly established; "I'll introduce you to my wife. Sit right down here, Miss Nancy. You must n't lay it up against her if you think we have n't treated you just right. It was n't her fault. You know you've got a mighty lot of influence over her, Miss Nancy, and the truth is, I was n't right sure it all worked my way,—yes, I know,—and I was n't right sure she'd find me as valuable in the hand as in the bush, so I just insisted that we get this business fixed before we said anything to you about it. I feel bad about the pictures, too, Miss Nancy. I know you were right about all that,—I know you were,—but, you see, we'd gotten ourselves into a tangle before we knew she was a genius, and it was too late—" His voice dropped into a sad little affectionate cadence as he fixed his eyes on the floor. Then he looked up at Beulah. "I can't say I'm sorry, Miss Nancy, but I'm willing to be a little sorry for her, and I'll lay out to make it up to her as far as I can. If she can paint any in Texas, she shall."

Beulah smiled, and as she smiled she sighed a little sigh.

## A SIMPLE CASE.

WITH PICTURES BY E. W. KEMBLE.

"THAT 'S IT — GO PITCHING INTO ME."

THE justice's office was over Shackleton & Podley's Trade Headquarters. It was reached by a flight of plank stairs tacked to the outer wall of the building and supported by wooden props. Huntley preceded Cleary up the steps, but before the small pine door which represented to him the portal of those precincts wherein dwelt the law, he drew back; and as he followed Cleary into the room he was half minded to remove his hat. He saw, however, that the lawyer went in with his head covered, and, vaguely relying on this precedent, plunged his hand into his trousers' pocket again. Perhaps this was the only time in his life that Mr. Huntley was visited by a doubt on a point of etiquette.

The justice was an enormously fat old man, with so great an expanse of bald head that one might easily find out countries on it. Topographically it might have been described as ranging from rough and broken over the forehead to fine, undulating table-land on the crown of the head. He wore a pair of round-eyed spectacles, and he wore them so constantly that there were two red ravines on each side of his face, diverging at the top of his ears; one running up over his temples, and the other leading to the corners of his pale blue eyes, which were so fat and wide and round that they seemed to have accumulated adipose tissue along with his body.

As the lawyer, followed by Huntley, approached the table, Justice Snagley laid down his paper, lifted his spectacles to the upper ravine, and turned slowly around in his cushioned, revolving office-chair. Cleary laid the paper on the table before the justice, smoothing it out for him as he said:

"Mr. Huntley here wants to make this affidavit before you, Judge."

The justice fixed his glasses, and read the affidavit; then he laid it on the table, and looked up at Huntley. Huntley stood before him stoop-shouldered, loose-jointed, gawky, his hands stuck into his trousers' pockets, his shapeless slouch-hat on the back of his head. His neck and ears were grimy with dust, and his lank, sunburned cheeks were stubbled over with a week's growth of red beard. He was looking down at Snagley with a kind of mild-eyed interest, and when the justice looked up he responded at once with a grin. Snagley lifted a flat-palmed right hand to the level of his shoulder and made three or four short upward motions with it. Huntley observed this little dramatization with a touch of bewilderment. He stared an instant at the hand; then, feeling that something was expected of him, grinned still more broadly, and nodded approvingly at Snagley; whereat the justice, being naturally somewhat irascible, glared hard at Huntley, swore a little, and sharply bade him to hold up his right hand and take off his hat.

His judicial function being discharged, Mr. Snagley unbent somewhat.

"Goin' to stan' 'im a suit, eh?" he said to Huntley, as he indorsed the affidavit.

"I think I ought-a beat 'im, don't you?" Huntley asked, eager for a shred of comfort.

Snagley rolled up his round eyes. "Law-suits, Mr. Huntley, is gol darn uncertain," he replied wisely, and with a touch of dignity in his voice.

"You get out the writ, Judge," said Cleary, starting for the door, "and I 'll go find Smiley."

"You 'll find Mr. Wentworth workin' on the street over by Risley's," Mr. Snagley returned severely.

To Lawyer Cleary the constable was Smiley, notwithstanding the rebuke of the justice. Cleary was of that disposition termed ungodly by old-fashioned and orthodox folk. Sufficient unto himself was Mr. Cleary. If a grateful community ever erected a statue to his memory, he would doubtless be shown

standing with his broad, flat feet well apart, one hand buried up to the knuckles in his trousers' pocket, and the other elevated before his breast and wagging an argumentative forefinger. He always wore a long, black frock-coat, a celluloid standing collar, and no necktie. His hair was red and thin, as were his eyebrows; his eyes were watery blue, set wide apart; he had the flattest, most indefensible failure of a nose; his mouth could be likened to nothing but a gash in a pumpkin; and his complexion was violently sanguine. But these things trou-

displayed on the other. Shackleton and Podley were at the back of the room talking with a real-estate agent, who sat humped over on the counter, smoking a corn-cob pipe. As Huntley approached, Shackleton turned around:

"Anything to-day, Mr. Huntley?" he asked in a business-like way.

"Oh, I jes dropped in," Huntley replied uncertainly, glancing at the opposite wall.

"Say, Huntley, I hear Risley got your mules," said the real-estate agent, tentatively, as Huntley lifted himself up on the counter and looked

"THE TRIAL 'S NEXT WEDNESDAY."

bled Mr. Cleary not a whit. If other people's opinions coincided with his, he congratulated them; if they differed from his, he pitied them: and he did both with equal sincerity. When word came that the Supreme Court had decided the Skinner county-seat case against him and his colleagues, he read the telegram over carefully, then shoved his hat back, and exclaimed in a tone of some annoyance, "Well, dad burr 'em! they guessed wrong—that 's all."

As Cleary went to find the constable, Huntley, left to himself, wandered to the bottom of the stairs, and furtively peered into the windows of Shackleton & Podley's, where on one side there was a pyramid of tin fruit-cans, and on the other an array of white and hickory shirts, silk handkerchiefs, and plow-shoes. He hesitated a few moments, then lounged in at the door, and walked slowly and somewhat uncertainly down the store, casting a glance now at the calico prints on one side and now at the groceries

about for a convenient place to discharge his mouthful of tobacco. The questioner had a shrewd, droll little face that all puckered toward a round rabbit mouth.

"Well, yes, he 's got 'em; but he won't have 'em long," Huntley replied, lounging forward and resting his forearms across his knees.

Podley rolled his fat little head to one side and looked sagaciously up at Huntley.

"How was that transaction, anyway, Mr. Huntley? How did you come to give that note?" he asked with an air of discreet interest. His precise utterance contrasted oddly with the slipshod speech of the other men.

"Well, you see," Huntley began, "long about thirty days ago a feller come to my place sellin' a patent churn—'n' it was a darn good churn too. My woman can make butter with it now twicet as quick 's she can with the old un'. Well, this chap he pertended to be appointin' agents; 'n' he went on with 'is lingo about bein' recommended to come to me, 'n'

about how much I could make out of it, 'n' all that kind o' talk. 'N' 'e did n't want no money— I was jes to sign a receipt fer the churn 'at 'e left fer me to use fer a sample, 'n' to sign a contrack to turn over the money less my commission, 'n' all that sort o' thing. 'N' where 'e fooled me, you see, he read over the receipt 'n' the contrack all right, but 'e 'ad a lot o' papers there on the table, 'n' when I come to sign, you see, 'e mixed 'em in the shuffle somehow, 'n' I s'pose I signed a note 'n' mortgage instead of a receipt 'n' contrack. I hain't much of a scholar, 'n' his jes readin' 'em over, 'course I s'posed they was the same 's 'e read. The woman wa'n't to home that day, so I up 'n' signed 'em. 'N' the mortgage— darn 'f 'e did n't do that pretty slick. He says, you know, that I 've got to give 'im a description of the mules, so 's the company 'll know I 've got a team to travel around with and do the canvassin'. 'N' 'e writes the description of the mules jes as I give it in the paper there— what I s'posed was the contrack; 'n' that 's how he got the description of the mules. I 've replevied the mules now. Course if I can prove 'at Mr. Risley wa'n't no innocent purchaser of the note, I 'll keep 'em."

"You say Risley has the mules now?" Podley asked.

"He did have 'em, but I 'm replevinin' 'em now," Huntley replied, looking at the door. "Course, soon 's the feller got the note he come here 'n' sold it to Risley— er pertended he did. Cleary 's been over to the county-seat 'n' looked at the mortgage, 'n' 'e says 'at it was printed right here by Potts to the 'Herald' office. Cleary says more 'n' likely Risley 'n' this chap was in cahoots all the time. Potts tol' me 'isself that 'e printed a lot of blanks fer this chap."

There was a little silence; then Huntley looked up with a doubtful grin.

"Gosh ding it! you see, I can't afford to lose them mules. I was all hailed out this spring, 'n' I got to have the mules to earn some money to keep the kids with this winter."

"Well, gentlemen, it 's an outrage," said the real-estate man, slipping from the counter; "it 's an outrage."

"Shameful, sir, shameful," said Mr. Podley, walking toward the front part of the store.

"I hope you will win your case, anyway, Huntley, and keep your mules," the real-estate man said as he followed Podley.

When they were out of hearing, Huntley turned to Shackleton. "How 's it goin' to be about gettin' a jag a flour, Shackleton?" he asked. "This blame lawin' 's goin' to take all my money right now, 'n' we 're about out up to the ranch."

Shackleton shook his head. "Could n't do t possibly," he said briskly. "Be glad to ac-

commodate you if we could; but we could n't do it. Too much out; too many bills to meet. Can't do it to-day, possibly."

Huntley looked down at the floor a moment. "I thought maybe you might lemme have fifty pound er so," he said meditatively, scratching his leg. "Get this darn business fixed up, I can pay you in ten days."

Huntley looked up, but Shackleton shook his head. "Too uncertain," he replied confidently. Then, laying both hands on Huntley's shoulders in the most brotherly manner, he said cheerily, "Do it in a minute, Lem, if we could; but the way things are now, we could n't possibly."

With his eyes upon the floor, Huntley loitered slowly toward the door. As he gained it, the constable appeared on the sidewalk, and gently waved his hand toward the opposite side of the street. "There 's your mules, Mr. Huntley," he said in a voice of subdued emotion, much as though he had conjured them up out of the ground and presented them to Huntley. In that event the sleek little bodies of those two bay mules could not have awakened more joy in Huntley's breast. He hurried across the street, and climbed into the wagon.

The mules set their brisk little legs in motion, and the wagon rattled out of town. Just outside of the corporation there was a slight rise of ground, and as the mules trotted up the gentle ascent, Huntley turned in his seat and looked back at the village below. On the opposite side of the town the railroad was laid along the level prairie with hardly any grading. There was a tall, glaringly red elevator and a little brown depot at the foot of the one straggling business street. Spreading out from the business street, comprising the remainder of Centropolis, were isolated, rambling dwellings, all of wood and mostly one-storied. Some slender saplings, at a little distance hardly distinguishable from bean-poles, set in a few of the front yards, made the only attempt toward shrubbery. Shade there was none, and the little collection of pine buildings stood broiling and frying under the intolerable August sun. Beyond the town the level prairie stretched away to a gauzy blue line on the horizon, made by the timber along the banks of the Sam River. The land was more undulating on Huntley's side, but there was not a hill or a tree in sight to break the wavy expanse of prairie. The grass was drying up, and the fields of ripe wheat, twenty, forty, sixty acres in a patch, made only yellower dots here and there in the waste of light brown and dingy green. The scattered "shacks" of the settlers, primitive board structures, covered in some cases with black tarpaper, scarcely made an impression upon the wildness of the scene.

As he rode along, Huntley observed the appearance of the wheat-fields, and noted that, like his own, some of the straw roofs of the stables needed patching. He watched a hawk sailing in long, graceful downward curves, and he listened to the cries of the killdees; he looked awhile at the up-twinkling hoofs of the mules, and occupied himself for some time in chasing a persistent horse-fly over Jimmy's back with the end of his whip. Finally, having exhausted all the apparent sources of amusement, he put the remainder of the tobacco into his mouth, slouched forward in his seat, with his arms resting across his knees, and gave himself up to the unwonted exercise of reflecting. When Huntley went into a committee of ways and means, his first expedient was always to consider what he could borrow. Now, the prospect in that direction was not encouraging. The "claim" was mortgaged, and probably for all he could get on it; he had just given Cleary a mortgage on the cow and pigs for costs and attorney's fees, and nobody would take a mortgage on the mules until the suit was decided. He might borrow enough plug tobacco "to run him through"—that was the term he always used, and it meant probably until he could get some more money. With that possibility in his mind, he checked off the first source of revenue. Crops all destroyed by hail; and he checked that item off. If he won the lawsuit and kept the mules, he could mortgage them for enough to pay Cleary and "run him through," and go back to his job of grading in Johnson County. Clearly, it all hinged on the lawsuit, and, having arrived at that satisfactory conclusion, Mr. Huntley dropped the inquiry, and turned for a moment to retrospection. Notwithstanding the hail-destroyed wheat, he had done so well with his grading that the perennial mortgage on the mules and the cow had actually been paid off, and he had ten or twelve dollars ahead. All kinds of astonishing vistas of unmortgaged ease and affluence had been stretching before his mental vision when that patent dasher came along and operated upon his hopes.

All this brought Mr. Huntley again to that no-thoroughfare of the lawsuit, and by this time the mules had brought Mr. Huntley home and were turning in from the road, which was a mere wagon-track over the grass, by a "shack" built of boards and covered with tar-paper. As the wagon creaked by the house, a round-faced, fat, stubby-legged little form, clad in waist and breeches, came running to the door, and with a cry of, "'Ere 's papp,'" darted after the wagon. "'Ere 's pappy,'" shrilled a small treble, and a smaller, rounder-faced, more stubby-legged form in a gingham dress came running after the first one. As the two left the house an infantile wail went up from within, and a form

all roundness and fatness came lumbering on all fours to the door. A little way from the house a cow was "lariated" on the prairie, and as Huntley drew up at the straw-roofed sod stable and began unharnessing the mules, a woman came hurrying across the grass toward the house carrying a tin milk-pail. She was tall and thin and stoop-shouldered. She wore an old, limp sunbonnet and a calico wrapper that, back and front, fell in straight lines from her head to her heels. As she came to the stable door Huntley was opening his jack-knife for "Oddy."

"Pap ain't got no candy fer you to-day, son," he said, with a big, homely smile that hurt him clear down to the bottom of his big, homely heart as he saw the little fellow's face fall. Mrs. Huntley peered in at the little brown beasts that were already munching their hay.

"Did you get the mules, Lem?" she cried eagerly.

Huntley looked at her with his slow, deprecatory smile. "Not fer keeps yet, 'Randy,'" he said. At his tone and expression the eagerness faded from the woman's face, leaving it seamed and dull. Huntley took the pail from his wife's hand, and the two walked together to the house, where he set the milk on the table, and then came out and lounged down on the grass while the wife sat on the door-sill. "Well?" she said, shoving her sunbonnet back and drawing her hand across her brows. Her form was bent, and her hands were as marred by work as his own; her face was lean and sallow, but there was a remarkable intelligence in her large, dark eyes, and she looked the daughter of a daring and self-reliant race.

"Well," her husband drawled, "we 've replevied the mules. The trial 's next Wednesday." He paused a moment, rasping his hand over his chin, and then went on: "I was talkin' with Cleary, 'n' he says 'at we 'll win 'er if we can get the right sort of a jury. He says 'at the feller had the papers—the contracts 'n' such—printed to the 'Herald' office, 'n' more 'n likely Risley knowed all about it. If we can jes prove 'at Risley knowed about the printin' of the contracts, that 'll knock 'im out. He says 'at Risley kind o' owns the printin'-office, somehow, 'n' if Potts 'll tell the truth about the printin', we 'll win 'er. Cleary says 'at if we get a jury o' farmers they 'll knock Risley out, anyhow, on gen'ral principles. I reckon mos' farmers don't have no love fer money-lenders." To Huntley, the plural pronoun, which he got from Cleary, represented himself the plaintiff, and Cleary the attorney, and all that part of the mysterious machinery of the law which he supposed somehow to be operating in his favor by virtue of Mr. Cleary's efforts.

"Seems like it 's too bad, Lem, to get into

trouble jes when we was gettin' along first-rate — a top of all the bad luck you 've had," said Mrs. Huntley.

"I know it, 'Randy. I know I ought n't to 'a' done it. I ought 'a' be'n cuter. But I thought it was a chance to make somethin' 'ithout leavin' you 'n' the young ones alone." Huntley confessed this awkwardly, and with his eyes on the ground.

"Oh, I ain't a-blamin' you, Lem. You thought it was all fer the best." She clapped her brown hands over her knees, and looked out over the ruined wheat-fields. Then she burst out with, "What can you expect when such scoundrels is left runnin' over the country?" — expressing as best she could the hot sense of outrage and rebellion which possessed her. She shut her lips a moment, and then asked quietly, "What 'll this lawin' cost you, Lem?"

Huntley looked up at her and then down at the ground. "I 'ad to give Cleary a mortgage on the cow 'n' pigs fer forty dollars to git the bond — 'n' the costs 'n' his fees," he said.

Mrs. Huntley laid her hand on his shoulder. "Lem, s'pos'n' you lose the mules, what 'll we do this winter with the cow 'n' pigs gone, 'n' you can't earn no more money gradin'?" she asked.

Huntley pulled his hat down over his brows. "Gawd knows, 'Randy," he said. He said "God" when he swore, and "Gawd" when he spoke reverently. He plucked up spears of the dried grass and tore them with his fingers, keeping his eyes on the ground. "I could n't get no flour to-day," he said, still looking down. He rasped his hand over his chin once or twice, and gave a choked laugh. "If the fros' don' nip that little patch o' corn, we can have some corn-dodgers by and by, I reckon," he added.

Mrs. Huntley's face had cleared by this time. "We 'll get along somehow 'nother, I reckon," she said, not hopelessly, as she arose.

Huntley pulled himself up slowly, and stood for a moment with his hand in his pocket, looking over the prairie. "Yes," he said dubiously; "I guess we 'll get along somehow. We 'most allus have — somehow."

## II.

POTTS locked the door of his printing-office, dropped the big, jointed key into his trousers' pocket, swung his coat over his shoulders, and started home. It was Friday night, and the week's issue was "off." At such times Potts usually walked briskly and held his head up; but to-night, though he walked rapidly, his step was slouching and his head bent down. He turned off from the business street, and at the end of two blocks came to the square, white

one-storied house to which he was fond of referring in the "Centropolis Herald" as "ye editor's domicile." Here, he constantly gave his readers to understand, the bosom of his family resided. James Garfield and Rutherford Hayes were playing with dust-heaps in the road; the twins were worrying the cat beside the house; and inside, pacing up and down the room and appearing at the door at the end of every beat, the eldest, Hildegard Evangeline, carried the youngest, Evelina Rosaline. In the Potts family the prerogative of naming the boys was Mr. Potts's, while his consort ransacked a memory well stuffed with long and wildly romantic names for the girls. The room, which took up half the space inclosed by the four walls of the house, was low. A worn and faded rag carpet did its level best to cover the floor, and, except for a ragged hole in the middle, succeeded very well with about two thirds of it. There were three or four straight-backed chairs; a pine table against one wall, and opposite a lounge of home manufacture, covered with a straw-stuffed tick of green calico; and a big, old-fashioned rocking-chair, which was indisputably the property of Mrs. Potts. Indeed, she occupied it now. Mrs. Potts was a fat and flabby woman, all of whose foundations seemed to have given away and left her hopelessly sagging and rickety. Her heavy eyelids drooped over her pale eyes, the corners of her mouth drooped, and even her fat, colorless under-lip drooped. Her round, heavy shoulders sagged forward, and her big, oily hands moved listlessly. She was occupied with trying the effect of a pale-pink cloth rose and a short, bright, straight red feather on her last summer's hat. As Potts entered, the child set up a peevish cry, and Mrs. Potts let the hat and its decorations fall into her lap.

"Ain't that child to sleep yet?" she asked grievously. "Take it into the bedroom, Hilly, and see if you can't rock it to sleep. It's 'mos' time for you to get supper." She said, "Is 'mos' time." Mrs. Potts was too tired to sound more letters than were necessary to convey her meaning.

Potts laid his coat and hat on the table and dropped into a chair. "Well," he said, as the girl and the baby left the room, "I've been subpoenaed in that Risley and Huntley case."

His wife looked disconsolately down at the pale rose and the bright feather in her lap. "Wad da they want o' you?" she asked.

"It's just this way, Gracie," said Mr. Potts, stroking his red chin-whiskers. "There's no doubt that that man Hawk was a little — not exactly square." Mr. Potts felt most apologetic to Mr. Hawk for being obliged to make this statement, but, having made it, he grew more courageous. "He swindled that Hunt-

ley; got him to sign the note and mortgage somehow, and Risley claims to have bought the note in good faith. And those blanks that I printed for Hawk—those—there was a correction on two of the proofs in Captain Risley's handwriting, which might have the look, or be made to appear, somehow, as though Captain Risley had some foreknowledge. Of course I don't think Captain Risley's the man to go into a barefaced fraud; and yet—" And yet those pencil-written words on the proof in Captain Risley's peculiar hand stared up at him.

"And they expect you to go and testify to that and get you in a scrape with Captain Risley," Mrs. Potts said, with a kind of sagged resentment.

"Of course Captain Risley never said a word to me about the blanks, nor I to him. All I know is those corrections," Potts hurried to say.

"Then wad da ye want to say anything about it for?" Gracie demanded.

Potts got up, and mopped his forehead. "If I'm put on the stand, Gracie," he said, "I'll have to tell the truth."

"Well, wad da you know to tell? You said he never said nothing to you, or you to him. Ain't that enough? Wad da you want to go lugging in the other about the proofs for," Mrs. Potts persisted dolorously.

Potts was nervously pacing up and down the room. "But, my dear," he expostulated, "it's not a question of lugging in anything. You don't seem to understand. Here's Huntley, a citizen, entitled to equality before the law. He calls upon me for my testimony. I am bound—it's my duty—my duty—" Potts felt that he was getting his feet on firm ground; but his wife rolled back with:

"Well, I don't know what that Huntley's ever done for you that he can expect you to get into a mess with Captain Risley for him."

"It ain't Huntley at all," Potts cried; "Huntley's got nothing to do with it—that is, with me." Mr. Potts paused a moment and untangled himself. "It's not what I owe to Huntley; it's what I owe to—civilization," and Mr. Potts spread out both his arms as though to express by the gesture the broad idea for which he could find no adequate word.

"And you're never thinking what you owe to Risley," his wife retorted. "That's just like you—you're always going off after some fool thing like that and letting the rest go. Look at what Risley's done for you—you know he's got a mortgage on everything you've got." Mrs. Potts was getting her spirit up; she even turned one flabby hand palm downward.

"But what do I owe to my conscience?

What do I owe to my Maker? What do I owe to my fellow-men? What—would you have me dishonest?" Potts cried vehemently, standing in front of his wife, and gesticulating.

At this Mrs. Potts began to whimper. "That's it—go pitching into me, go hectoring me," she said. "And what do you owe to your poor family? We can be turned out, and be outcas's. You ain't got no feeling for us."

"Why, my dear, I'm sure I did n't mean to speak harshly. I'm sure, my dear wife, the happiness of you and the children is my first consideration. I'm sure I did n't intend—I only wanted to show you how necessary it was that I should hold up my head with honest men—"

"And you don't care about me holding up my head. I can be a beggar; I can be nobody. Only to-day Mrs. Risley called on me, and asked me to come up and bring the children." Mrs. Potts gazed down at the finery in her lap, and at the decaying hopes which it represented to her; she wept afresh.

"Why, I certainly wish you to be somebody. I wish you and the children—" Mr. Potts began.

"No, you don't," his wife wailed. "You ain't got the feelings of a man. We can be turned out; we can be beggars and outcas's. We can go back to preaching, and be dogs, and you don't care."

Potts stood alternately gnawing and pawing his fiery whiskers.

"But, Gracie, my dear, consider," he appealed frantically.

"No, you ain't," she blubbered. "You know you ain't."

Potts stood for a moment beside the table, chewing fiercely at his beard, and overwhelmed with grief, penitence, and oddly mingled rage; then he seized his hat and bolted from the room. He went through the lot to a board shed at the rear, which had once harbored the cow of a more prosperous tenant. Entering this, he sat down on the cool, trampled dirt, with his feet stuck straight out before him, and, holding his hands over his chest, gave himself up to meditation.

Potts felt that the problem of life, never easy of solution, had suddenly snarled and drawn into a hard knot for him. He had been reared in primitive orthodoxy, and had begun life as a Methodist minister. To him the commands of the Bible were "Yea, yea," and "Nay, nay." "Thou shalt not bear false witness" were the words now. To commit flat perjury would have been to him as hurling a defiance at God, as leaping into a literal hell. It was that which troubled him; but the temptation in the words of his wife buzzed and whispered to him. He could say truthfully that Risley had never spoken a word to him about the printing of those blanks, and that he had

spoken no word to Risley; certainly Hawk had never mentioned Risley. There were those two peculiar words—but, after all, what were they, that merely on the strength of them he should accuse Captain Risley of fraud? To Potts the prospect of opposing Risley was only less terrifying than that of defying God. That Risley had him in his power in a material way did not count for so much with him; but in the year and a half of their intercourse Risley's strong will had gained a great ascendancy over him, and that he, Potts, should publicly bear witness that impugned Risley—the thought startled him, and, besides, how could it be true? As he thought of it in this light it all became easy to him. He could answer every question promptly; he could say that Risley never said, or wrote, or intimated a thing in connection with those blanks, and could come down from the stand with Risley smiling, his wife pacified, and himself unhurt. And what of those pencil-marks, anyway? Some accident would one day account for them, for it was not possible that Risley could be guilty of a deliberate villainy. He thought over the probable examination, imagining the questions one by one. He answered one after another. The attorney pressed closer and closer. He turned, equivocated, finally lied downright. Then the attorney leveled a threatening finger at him, and thundered, "Do you dare swear to this court, sir, that there are not two words on those proofs written in Captain Risley's hand?" The perspiration stood on Potts's brow. He saw himself stepping off from the only way of life that he had ever known or thought it possible to know, and wandering away into a great, dark unknown somewhere. The straight path was before him, so hard to follow, but so safe; away from that, what was there? A vague and fatal region at which he shuddered.

Again he imagined himself braving Risley, suffering his wife, facing rage, persecution, starvation; and he grew quite heroic over it, and clenched his little fists against his breast. Then his wife's peevish voice, and Risley's dull, persistent eyes and square mouth, came to him, and he unclasped his hands and mopped his face in his shirt-sleeve. There was something in Potts's mind back of this; namely, his idea of his peculiar relations to the Deity. As a Methodist minister he had followed the call until at length the slow, persistent opposition of his wife had worn away his resolution, and he had renounced the ministry to come to Centropolis and found the "Herald." The one thing about Mrs. Potts besides flesh was a kind of social ambition "to be somebody," and the position of a preacher's wife did not suit her at all. When Potts gave up his charge, he did not consider himself a lost man, but he had a

notion that God regarded him askance and with a kind of sorrowing doubtfulness. His prayers were largely apologetic, and he resorted to them with a shamed humility.

## III.

BESIDES his own desk, there was in Justice Snagley's court-room a long, narrow table of rough board, more like a broad, long-legged bench, for the lawyers; one bench for the jury; and two other benches and an awkward squad of wooden chairs, of different styles and in different stages of dilapidation, for the spectators.

Haggis, attorney for Risley, sat at one end of the table, bolt upright in his chair, and examining some papers. Haggis was of the build colloquially termed "sawed off," and he had big blue eyes that popped out at you with an expression of pompous surprise. Cleary hoisted his feet comfortably on the other side of the table, and tilted back in his chair. Mr. Cleary was in very good humor. Whatever he knew of Risley's connection with the printing of those blanks, he felt now that Potts's testimony was of minor importance. He looked across the table at the six stupid, honest faces ranged along the jury-bench, and he gleefully assured himself that not a man of them but had paid Risley his three per cent. a month. As he contemplated them his mouth expanded in that incredible grin.

Potts sat on one end of the bench, his hat held between the thumb and forefinger of one hand, and both hands clasped between his thin knees. His coat and vest were unbuttoned, and his mouth was open, taking in the air in long, laborious inspirations.

Huntley sat beside Cleary with his arms resting on the table, and feeling some recompense for the worry and trouble of the past week in his temporary importance—for Huntley had an idea that it was his show. As the spectators dropped in he looked at them with a most hospitable expression, and wished them to feel entirely welcome.

The justice straightened up in his chair, and said, "Well, gentlemen," and the trial began.

When Risley took the stand he fixed his small, wary eyes on Haggis and answered his questions promptly, pulling now and then at his dusty mustache. He testified that he knew nothing of any churn or agency, but supposed the note against Huntley to be given for value, and that he bought it in good faith. Cleary took him in hand with a manner of the blindest confidence; but Risley kept his small, wary eyes upon him, and his small, wary brain, too, and Cleary got nothing from him. He wagged his coercive forefinger in vain; he even smiled at him once or twice without effect. The witness

was very positive that he had no knowledge of any blanks used in the procuring of the note and mortgage, and very, very positive that he had nothing whatever to do with the preparing or printing of such blanks. He was quite willing to swear to this court, as Mr. Cleary threateningly requested him to do, that he never saw any such blanks nor any copy for such blanks. As Risley answered in his calm, monotonous tone, Potts felt a mighty load lifting from his mind. With Mr. Risley's example before him, testifying did not seem so difficult a matter after all.

Potts walked to the chair occupied by the witnesses with a firm step. He squared his shoulders, put his feet together, held up his head, looked the justice square in the face, and took the oath without a tremor. The turmoil of doubt and dismay left his mind, and all his faculties were bent in awaiting the trial; but he was aware in one instant of inward illumination that the question of what he was to say was still undetermined—that it was still to commit perjury or to tell the truth. He informed the court promptly, at Mr. Cleary's request, that his name was Victor C. Potts; that he resided in Centropolis; and that his occupation was editing the "Centropolis Herald" and running the "Herald" printing-office. He knew Hawk, the churn-man, and had done some printing for him; had printed some contracts and some deeds, some notes and some chattel mortgages. He denied that H. Risley was owner, or proprietor, or silent partner of or in the "Herald" establishment, or that he had any supervision over or connection with the printing-office in any way; and he admitted that he had pecuniary relations with Risley, and that Risley was often about the office.

"Now, Mr. Potts, who gave you the order for printing those patent-churn agency-blanks?"

"Hawk."

"Did Hawk ever say anything to you which led you to think that Risley had any connection with, or any knowledge of, the preparing or printing of those blanks?"

"No, sir; he did not."

"Did you ever mention them to Risley?"

"No, sir."

"Ever show them to him, either the blanks or the proofs or the copy for the blanks?"

"No, sir; never."

"Did Risley ever say anything to you in regard to them?"

"Never, sir."

"Was Risley ever in your printing-office while they were being printed?"

"Very likely he was; he comes there often."

"Are you very sure that he never saw them there?"

"I don't think he ever did. Certainly, I don't know that he ever did."

Cleary paused a moment, and pulled at his mustache.

"Then, Mr. Potts, you don't know that Risley ever saw those blanks, or the copy for them, or the proofs of them?"

"I'm certain he never saw them in my presence."

Cleary pulled at his mustache, and Potts held himself for the next question. He felt himself at an extreme tension, and he had a desperate wish to plunge through and have done with it. He was aware of Huntley's long, anxious face beyond Cleary, and of the justice's head across from Huntley.

Cleary considered a moment and then he said, "That 's all; take the witness."

As Cleary spoke, and Potts realized that his examination was ended, he experienced a sensation of relief which changed and sank back instantly into an overwhelming fear and depression. He felt a kind of awe and quailing, and he felt himself condemned and cast out. A curtain fell behind him, a lump came into his throat, and there was a palpable heaviness at his heart. Haggis was speaking to him, and Potts turned toward him.

"Your testimony is, then, Mr. Potts," he said, "that, so far as you know, Mr. Risley had no knowledge of those blanks?"

Potts gripped the arms of his chair. He felt his heart hammering in his breast, and his nerves tightened.

"No," he said, fixing his eyes upon the justice and speaking slowly and laboriously; "there were two words—corrections—on the proof in Captain Risley's handwriting."

Haggis bent forward, and his eyes threatened Potts. "There were—what?" he asked incredulously.

"There were two words—corrections—written on the proofs in Captain Risley's hand."

"Are you certain of that? Can you swear that those words were in Captain Risley's hand?"

"I am very familiar with Captain Risley's hand,—it is peculiar,—and I am positive that the writing on the proof is exactly similar to his."

Potts took in a huge breath. He was quite pale, and there was a deafening rush in his brain.

"Have you those proofs—can you produce them?" Haggis demanded threateningly.

"I can," Potts answered.

Potts walked from the room with his eyes fixed straight before him; and when he came back with the proofs in his hand he fastened his eyes on the justice the moment he entered

the door, and never moved them until he was safely in the witness-chair. Other witnesses testified to the similarity between the words on the proof and Captain Riskey's handwriting. Riskey was recalled, and simply and stolidly denied the writing.

For half an hour Cleary shrilled against bankers, usury, fraud, and oppression; and for a full hour Haggis bellowed anathemas at trickery, shiftlessness, and printers. In that community, dependent for its material and political support upon the bucolic population, a lawyer would as soon have inveighed against the Constitution and the Ten Commandments as to have whispered a suspicion that farmers were not the deserving and oppressed of earth. It took the six farmers and laborers who composed the jury not six minutes to return a verdict for the plaintiff.

As the crowd was leaving the room, Huntley, for a moment, turned his huge and jubi-

lant grin upon Potts, at whom Cleary also ducked his head and smiled. At the door Riskey brushed by, and Potts clenched his hands and looked him squarely in the face. The banker's malevolent glance fell, and he walked on with long, heavy steps.

At six o'clock, as the mules trotted by the "shack," Huntley's face still wore that enormous grin. There was flour in the wagon, and in his pocket, besides red stick candy and plug tobacco, there was actually a roll of bills: for Mr. Huntley had mortgaged the mules, paid Cleary, and had money enough left "to run him through."

Potts went down to his printing-office, where he locked himself in for half an hour. When he came out there was dust on the knees of his trousers; but his freckled, red-whiskered little face was serene, and he walked home with a step in which there was no hesitation.

*Will Payne.*

## LAND OF THE LIVING CLIFF-DWELLERS.

NE of the most interesting and least known portions of the North American continent is that lying along the boundary line between the Mexican States of Chihuahua and Sonora, in the

northern part of that republic. Early in March, 1889, a small party under my charge crossed the boundary between the two republics just south of Deming, New Mexico. On crossing the boundary we came to a rich and fertile country that contrasted strikingly with the well-known arid region of the southwestern part of our own Territory. Beautiful mountain streams spring from the flanks of the Sierra Madre range, and water profusely the foot-hills of the Cordilleras in a country which, judging from our own near by, we expected to find almost barren of water. Here the wild Apaches loved to graze their ponies on the sweet grasses of the rolling hills, and in view of its fertility the obstinacy with which for many years they closed this country to civilization can be easily understood.

In this portion of Chihuahua we found ruins of houses, villages, and towns along the valleys, most numerous where the soil was richest, while there were terraces and irrigating-ditches along the hillsides, which plainly spoke of a peaceful mode of life; yet on the hilltops and crests of cliffs were undoubted signs of old fortifications, which showed the warrior element among them. I had expected to find many ruins in my travels through this part of the country, but I

confess that the great profusion of them surprised me. In one day I made a wide circuit back into the mountains, returning by another trail to my camp on the Piedras Verdes River, and in that thirty miles of almost continuous riding I believe I saw from 100 to 150 separate and distinct ruins.

Far back in the Sierra Madre range there are one or two curiously combined cave- and cliff-dwellings, long since abandoned, that are ingeniously supplied with water. At one place a deep cave has been divided into many small rooms, one of them containing a huge jar that takes up the whole interior of the compartment, and which, unless the cave was densely populated, must have furnished a water-supply for a week at least; and sieges by predatory tribes probably could not have been maintained longer than that. In the other cave the plan was more ingenious, and a greater supply was secured. Instead of one reservoir, there was a series of them, each just below its fellow, so as to receive its overflow, the top one fed by a sweet-water spring and the last emptying over the cliff into the stream below. The proximity of water coupled with the reservoirs clearly indicated defense in both cases, giving force to the conjecture that the stone piles and ridges seen elsewhere on the hilltops overlooking other ruins were for a similar purpose. Stone axes and hatchets were found in comparative profusion around these numerous ruins. The deserted dwellings suggested to my mind that there was probably some connection between the ancient cliff-dwellers of

Arizona and New Mexico and the living cave- and cliff-dwellers of southwestern Chihuahua, toward whom we were traveling.

The country of the Sierra Madre in the land of the living cliff-dwellers is most thoroughly alpine in character. We approached the crags and cliffs of that region from the east by an elevated plateau as high as the crests of the mountain-chains in the country, so that we looked down into this alpine section rather than up to it, as would have been the case had we approached from the Pacific side.

The native people found by us may be said to be of two kinds, the so-called civilized and the savage, but so gradually passing from one into the other that the distinction cannot be clearly made, though in the extreme of each this difference is so wide as to impress the beholder with the thought that there is no connecting-link. Our first encounter with the semi-civilized was on the Papigochoo River, in the heart of the Sierra Madre. They were working in a little field where the windings of the mountain river had left a level space. They were Tarahumaris, a tribe of great extent in this part of Mexico, and one to which I believe the cave- and cliff-dwellers belong, although this subdivision of the family has drifted so far away from the parent stock that at first glance one would not recognize them as relatives. Both the semi-civilized and the savage branches are singularly alike in their timidity, even the civilized ones usually trying to avoid strangers if possible, though never fleeing from them like so many wild beasts, as the uncivilized ones always do. The Mexican packers of mule-trains in the Sierra Madre range are very noisy in urging forward their plodding animals. They claim that this does some good in the way of notifying an approaching train of their presence, so that the two will not meet and attempt to pass on those dizzy cliffs and dangerously small trails on the steep mountain-sides so very common on the backbone ridge of the sierras. Certainly it tells the timid Tarahumari of their coming, and if not engaged in too important work on his little farm he will not be seen when the travelers pass by. Mr. Becerra told me that he had traveled the whole distance across the Sierra Madre through the Tarahumari country without seeing one of the natives when he was accompanied by a pack-train, and, again, had gone over the same route and had good views of them by the score when making his own way over the trail or with only a companion or two.

Some two or three hundred years ago the Spanish Jesuits came among these people and converted numbers of them to their faith; the descendants of those converts, I assume, are now the so-called civilized Tarahumaris, who live in rude houses and roughly cultivate the fields.

The savage race live mostly on the cliffs or in caves, are worshipers of the sun, and, while they plant a little corn without cultivation on the steep hillsides, they are not otherwise tillers of the soil, but sustain themselves by the chase.

The civilized Tarahumaris of the Papigochoo were plowing with rude wooden plows with hard-wood points. That night we camped on the Guajochic, a much prettier stream than its Tarahumari name would indicate. I was told that the last syllable "chic," meant "the place of," the remainder of the word filling out the phrase, and that it was applied to all geographical names; another person said that a friend who spoke the language called it "water." I could not get definite information as to its signification. The most appalling part of this language, to a stranger, is the inordinate length of a great many of the words—Cusi-huiriachic, a Mexican town of from 6000 to 7000 souls, being a fair example, but far from the longest.

It was early in May, about noon, when my party crossed the beautiful Bacochic. We were all mounted on mules, while pack-mules carried our effects. The sides of the mountains inclosing the stream at this point were precipitous, while a lot of broken shale on the narrow trail made it somewhat hazardous, and even dangerous, when near the steep cliffs. A deep ravine cutting in at right angles to the Bacochic closed our way to the north as we ascended the winding trail, and when we had worked our way up the steep bank some 200 or 300 feet, a favorable exit from the low, scrubby pines gave me an opportunity to look straight across this picturesque ravine, and I was surprised to see, on the other bank, which seemed even more precipitous than the one on which I stood, a deep cave walled up in front nearly to the top, and evidently indicating cave- or cliff-dwellers. My first thought was that the curious habitation in front of me belonged to the era of similar buildings in Arizona and New Mexico, which the best authority consigns to a very old period. With me, however, was a Mexican gentleman who said that the cave was inhabited, but as the occupants were extremely timid, probably we would not be able to see them without forcing an entrance into their strange home. He believed that most of them were inside peeping at us over the rude walls and around the very dilapidated animal's hide that served to close the door. The cave was not over two hundred yards away, and, with the aid of our field-glasses, we could plainly make out its details.

My impressions led me to the theory that these were vagabond individuals of the local Indian tribes who were occupying this old cave-dwelling in the cliffs, much as we see the

DRAWN BY OTTO BACHER.

CAVE-DWELLINGS.

FROM A PHOTOGRAPH.

corresponding class with us occasionally occupying dugouts, shanties built into the side-hills, and even caves around the suburbs of towns. But one of the Mexicans, who argued against forcible intrusion into the homes of these people, said that we would find a great number of them further on in the deep recesses of the Sierra Madre range, and that among so many we would have good opportunities of seeing them to better advantage than we possibly could here. My Mexican friend was born and reared in this part of Chihuahua; his father and uncle owned one of the largest and richest mining-districts in that portion of the Sierra Madre toward which our course was directed, and to reach which he attached himself to our party for a couple of days, when our paths separated. His business called for almost constant traveling in these parts. He placed the number of living cliff- and cave-dwellers in this part of Mexico at from 9000 to 12,000 persons. We afterward saw from 300 to 500 of them, which, considering their great timidity and the small part of their land traversed by us, would give an air of reasonableness to the estimate of Don Augustin Becerra, for such was my friend's name.

Even as we stood on the edge of the cliff opposite this singular home, we saw an Indian in the cañon far below. He appeared to be wearing only a breech-clout of animal skins; he carried a long bow and arrows. He looked almost as dark as a Guinea negro as he skirted the shadows of the cañon, and his hair was long. A rattling of the falling chips of shale drew his attention to us, when he at once

skulked behind a big boulder at the base of the cliff, and we saw him no more.

Everywhere in the mountains the semi-civilized Tarahumaris are used as couriers and mail-carriers, none of the domesticated animals being able to keep pace with them for long or for short distances. Halting to camp about three o'clock one afternoon, a Tarahumari mail-carrier passed my party, bound in the same direction that we were traveling and toward a point we expected to make in some two days' good marching. Replying to a question, he said that he would reach this point early that night, a feat which we afterward ascertained he had accomplished. Not very long ago, before the diligence, or Mexican stage line, was put on from the city of Chihuahua to the foot-hills of the Sierra Madre, the mail was carried from that city to the mining-camps on the western mountain-slopes by a Tarahumari, who made the round trip with his thirty or forty pounds of mail and provisions in just six days, resting Sundays in Chihuahua to see the bull-fight. This distance is over 500 miles, half of it being on as rough and hazardous a mountain-trail as any in the known world.

In the Barranca del Cobre a trail leads 5000 feet or more up the steep mountain-side to the crest of the range. It takes five or six hours to ascend it on muleback along the twisting trail. It takes four or five hours to descend. A Tarahumari courier carried a message from a person at the crest to another in the bottom of the cañon, and returned, in an hour and twenty minutes. In fact the word "Tarahumari" means "foot-runner."

The semi-civilized Indians are very fond of a sort of foot-ball game in which speed counts for more than the qualities we usually associate with this contest. A favorite trick is to catch the ball on the toes and run with it to the goal.

The mountain-trails are one of the most curious and interesting features of the central sierras. They go up grades that would be dangerous to ascend on foot if made directly up the face of the mountain, but by winding backward and forward on "switch-backs" of from 25 to 50 yards in length, increasing the distance tenfold, they make a trail that the ibex-like Mexican mule can travel. The loss of foothold is now and then about equivalent to loss of life; for the trails on these steep slopes seldom average over four or five inches in width, and are sometimes cut out of the solid rock. They often wind round dizzy spurs, cliffs,

river directly underneath. Some years ago a fine Mexican rider attempted this place on a dark night, and his mangled body and that of his mule, which were found next morning on the boulders in the shallow river beneath, showed too plainly how he had met his death. I weighed 267 pounds, and my mule was a correspondingly large animal, so I had a delightfully cool sensation as the great "pinto" beast took up a lumbering trot when he came to this part of the trail; for it should be borne in mind that the best riders give their animals wholly their own way in crossing dangerous or even debatable places. The depth and height these trails attain in the great barrancas and cañons of the mountainous sierras are wonderful, and furnish some of the most picturesque scenery in the world. At nine o'clock one forenoon we were on La Cumbra (The Crest) of the moun-

and precipitous bluffs. Near Batopilas the maximum is reached in La Infinidad (The Infinity of the Mexicans), where from a trail cut in rock the rider looks over the side of his mule a vertical 2600 feet to the cañon-bottom below. At another point on the Urique trail we had a short stretch of a few yards where the trail was "stuck on" to the side of the hill like the top of a row of swallows' nests, and from which one looked vertically for about 500 feet into the

tains overlooking the Grand Barranca of the Urique, and where we could get a drink of ice-water from the rills, breathe cold air, and listen to the wind in the pines around us. In three hours we were among orange- and lemon-groves, eating their ripe fruit, or bathing in water of tepid temperature, and breathing air that was almost stifling. We had fallen a vertical mile in that time, but had twisted and wound round ten times as far to make it.

CAVE-DWELLING ON THE BATOPILAS TRAIL.

The scenery of the Chihuahuan Sierra Madre is magnificent beyond conception. The Grand Barranca of the Urique surpasses the Grand Cañon of the Colorado in points of vastness and magnificence. It is not so continuously a cañon, with monotonous walls of perpendicular rock for miles and miles, as the latter, but here and there breaks into openings of many miles in width, which furnish the most stupendous alpine scenery that the eye ever rested on. Great, frowning buttresses of rock a mile in height soften backward into slopes of almost pastoral beauty, while, between, the curious cliff- and cave-dweller makes his home, forming in all a wonderland unsurpassed in the world's many marvels. The Arroyo de las Iglesias (the Valley of Churches) should be called the Valley of Church Spires and Cathedrals. For a number of miles the bewildered traveler wanders through a fairy-land of sculptured rock and water-carved walls that keep him comparing them here and there with birds and beasts, with busts and statues, with faces and figures, and with a thousand fanciful designs. Here are caves and caverns on a level where the ancient and present waters could carve the soft rock to the best advantage, while above come fluted columns, domes, minarets, flying-buttresses, and all the shapes and moldings that art or architecture ever conceived. Surmounting all are spires and even spears in slenderness, some of

them bearing aloft the most grotesque designs in hard rock that has defied the sculpturing of the elements, while their pedestals have been carved to a singularly slender and fragile appearance. On one column was the form of an eagle with outspread wings, which might have been taken for this emblematic bird in reality but for its enormous dimensions.

In many of these caves and caverns and curiously carved cliffs live the wild Tarahumaris. Some of their houses are simply the rudest of caves partly walled up in front; others are partitioned off into rooms; and a few, like the one shown above, have well-built bake-ovens with rude shelves for holding primitive cooking-utensils. In a few large-size caves, high up in the cliffs, were little stone houses of three sides, very similar to some deserted cliff-dwellings I have seen in the southwest of our country. The most curious houses were those on the steep cliffs where no caves existed. Probably a stratum of soft rock some six or eight feet thick had been washed out by the waters until a deep furrow had been made, and in this the living cliff-dweller constructed his home of three sides, the diminutive windows, when seen from the cañon-bottom far below, looking like port-holes in a block-house. These small windows were also found in the detached houses in the other caves, but, where the front of the cave was walled in, light was generally secured

by not continuing the wall to the top, there being an interval of a foot or two. The overhanging crest of the cave usually projected far enough over to prevent any rain from beating in.

So precipitous are some of the inclines leading to a few of these cliff-buildings that even these ape-like creatures cannot ascend them, and

Indians. Their faces are generally meek-looking, but with some signs that denote personal bravery. They are sun-worshippers, and expose new-born babes to the rays of that orb during the first day of their existence. They have a superstitious fear of the owl, to which they attribute many baleful influences. Their extreme timidity is the most salient feature of their char-

LOOKING INTO THE GRAND BARRANCA.

they pass from one bench in the rock, where they can get a foothold, to another directly overhead or underneath by means of a notched stick or log, which they climb like so many monkeys. Sometimes three or four of these are needed to reach a very high cliff-dwelling on a precipitous incline; for I have seen them living in cliffs so steep that I believe a stone tossed from the hand with ordinary force would reach the bottom of the cañon, two or three hundred feet below, before striking the walls of the cliff.

These living cave- and cliff-dwellers of the Chihuahua sierras are tall, very muscular, though quite lean, and dark-colored even for

acter as viewed from our standpoint. In some of the more retired recesses of the great broken barrancas of the sierras these rude people are nearly or quite naked except for a pair of rough rawhide sandals. They never tattoo or wear masks, so far as I could learn; but very little of their inner life is known. The civilized branch of the Tarahumaris and the lowly Mexicans regard with contempt the cliff- and cave-dwelling Indians. Since one of the richest mining-districts of the world lies near the land I have briefly described, it will not be long before the age of steam and electricity will replace the age of stone.

# Thumb-nail Sketches

## THE CLAVECIN, BRUGES.

A SILENT, grass-grown market-place, upon the uneven stones of which the sabots of a passing black-cloaked peasant clatter loudly. A group of sleepy-looking soldiers in red trousers lolling about the wide portal of the Belfry, which rears aloft against the pearly sky

All the height it has  
Of ancient stone.

As the chime ceases there lingers for a space a faint musical hum in the air; the stones seem to carry and retain the melody; one is loath to move for fear of losing some part of the harmony.

I feel an indescribable impulse to climb the four hundred odd steps; incomprehensible, for I detest steeple-climbing, and have no patience with steeple-climbers.

Before I realize it, I am at the stairs.

"Hold, sir!" from behind me. "It is forbidden." In wretched French a weazened-faced little soldier explains that repairs are about to be made in the tower, in consequence of which visitors are forbidden. A franc removes this

military obstacle, and I press on.

At the top of the stairs is an old Flemish woman shelling peas, while over her shoulder peeps a tame magpie. A savory odor of stewing vegetables fills the air.

"What do you wish, sir?" Many shrugs, ges-

ticulations, and sighs of objurcation, which are covered by a shining new five-franc piece, and she produces a bunch of keys. As the door closes upon me the magpie gives a hoarse, gleeful squawk.

. . . A huge, dim room with a vaulted ceiling. Against the wall lean ancient stone statues, noseless and disfigured, crowned and sceptered effigies of forgotten lords and ladies of Flanders. High up on the wall two slitted Gothic windows, through which the violet light of day is streaming. I hear the gentle coo of pigeons.

To the right a low door, some vanishing steps of stone, and a hanging hand-rope.

Before I have taken a dozen steps upward I am lost in the darkness; the steps are worn hollow and sloping, the rope is slippery—seems to have been waxed, so smooth has it become by handling. Four hundred steps and over; I have lost track of the number, and stumble giddily upward round and round the slender stone shaft. I am conscious of low openings from time to time—openings to what? I do not know. A damp smell exhales from them, and the air is cold upon my face as I pass them. At last a dim light above. With the next turn a blinding glare of light, a moment's blankness, then a vast panorama gradually

dawns upon me. Through the frame of stonework is a vast reach of grayish green bounded by the horizon, an immense shield embossed with silvery lines of waterways, and studded with clustering red-tiled roofs. A rim of pale yellow appears,

—the sand-dunes that line the coast,—and dimly beyond a grayish film, evanescent, flashing—the North Sea.

Something flies through the slit from which I am gazing, and, following its flight upward, I see a long beam crossing the gallery, whereon are perched an array of jackdaws gazing down upon me in wonder.

I am conscious of a rhythmic movement about me that stirs the air, a mysterious, beating, throbbing sound, the machinery of the clock, which some one has described as a "heart of iron beating in a breast of stone."

I lean idly in the narrow slit gazing at the softened landscape, the exquisite harmony of the greens, grays, and browns, the lazily turning arms of far-off mills, reminders of Cuyp, Van der Velde, Teniers, shadowy, mysterious recollections. I am conscious of uttering aloud some commonplaces of delight. A

slight and sudden movement behind me, a smothered cough. A little old man in a black velvet coat stands looking up at me, twisting and untwisting his hands. There are ruffles at his throat and wrists, and an amused smile spreads over his face, which is cleanly shaven, of the color of wax, with a tiny network of red lines over the cheekbones, as if the blood had been forced there by some excess of passion and had remained. He has heard my sentimental ejaculation. I am conscious of the absurdity of the situation, and move aside for him to pass. He makes a courteous gesture with one ruffled hand.

There comes a prodigious rattling and grinding noise from above, then a jangle of bells, some half-dozen notes in all. At the first stroke the old man closes his eyes, throws back his head, and follows the rhythm with his long, white hands, as though playing a piano. The sound dies away; the place becomes painfully silent; still the regular motion of the old man's hands continues. A creepy, shivery feeling runs up and down my spine, a fear of which I am ashamed seizes upon me.

"Fine pells, sare," says the little old man,

suddenly dropping his hands, and fixing his eyes upon me. "You sall not hear such pells in your councree. But stay not here; come wis me, and I will show you the clavecin. You sall not see the clavecin yet? No?"

I had not, of course, and thanked him.

"You sall see Melchior, Melchior t'e Grootte, t'e magnif'."

As he spoke we entered a room quite filled with curious machinery, a medley of levers, wires, and rope above, below two large cylinders studded with shining brass points.

He sprang among the wires with a spidery sort of agility, caught one, pulled and hung upon it with all his weight. There came a r-r-r-r-r-r of fans and wheels, followed by a shower of dust; slowly one great cylinder began to revolve; wires and ropes reaching into the gloom above began to twitch convulsively; faintly came the jangle of far-off bells. Then came a pause, then a deafening boom that well-nigh stunned me. As the waves of sound came and went the little old man twisted and untwisted his hands in delight, and ejaculated, "Melchior you haf heard, Melchior t'e Grootte—t'e bourdon."

I wanted to examine the machinery, but he impatiently seized my arm and almost dragged me away, saying, "I will skow you—I will skow you. Come wis me."

From a pocket he produced a long brass key, and unlocked a door covered with red leather, disclosing an up-leading flight of steps, to which he pushed me. It gave upon an octagon-shaped room with a curious floor of sheet-lead. Around the wall ran a seat under the diamond-paned Gothic windows. From their shape I knew them to be the highest in the tower. I had seen them from the square below many times, with the framework above upon which hung row upon row of bells.

In the middle of the room was a rude sort of keyboard, with pedals below, like those of a large organ. Fronting this construction sat a long, high-backed bench. On the rack over the keyboard rested some sheets of music, which, upon examination, I found to be of parchment and written by hand. The notes were curious in shape, consisting of squares of black and diamonds of red upon the lines. Across the top of the page was written, in a straggling hand, "Van den Gheyn, Nikolaas." I turned to the little old man with the ruffles. "Van den Gheyn!"

I said in surprise, pointing to the parchment. "Why, that is the name of the most celebrated of *carillonneurs*, Van den Gheyn of Louvain." He untwisted his hands and bowed. "Eet ees ma name, mynheer; I am the *carillonneur*."

I fancied that my face showed all too plainly the incredulity I felt, for his darkened, and he muttered, "You not belief, Engelsch? Ah, I skow you; then you belief, par-hap," and with astounding agility seated himself upon the bench before the clavecin, turned up the ruffles at his

wrists, and literally threw himself upon the keys. A sound of thunder, accompanied by a vivid flash of lightning, filled the air, even as the first notes of the bells reached my ears. Involuntarily I glanced out of the diamond-leaded window: dark clouds were all about us, the house-tops and surrounding country were no longer to be seen. A blinding flash of lightning seemed to fill the room; the arms and legs of the little old man sought the keys and pedals with inconceivable rapidity; the music crashed about us with a deafening din, to the accompaniment of the thunder, which seemed to sound in unison with the boom of the bourdon. It was grandly terrible. The face of the little old man was turned upon me, but his eyes were closed. He seemed to find the pedals intuitively, and at every peal of thunder, which shook the tower to its foundations, he would open his mouth, a toothless cavern, and shout

aloud. I could not hear the sounds for the crashing of the bells. Finally, with a last deafening crash of iron rods and thunderbolts, the noise of the bells gradually died away. Instinctively I had glanced above when the crash came, half expecting to see the roof torn off.

"I think we had better go down," I said. "This tower has been struck by lightning several times, and I imagine that discretion—"

I don't know what more I said, for my eyes rested upon the empty bench, and the bare rack where the music had been. The clavecin was one mass of twisted iron rods, tangled wires, and decayed, worm-eaten woodwork; the little old man had disappeared. I rushed to the red leather-covered door; it was fast. I shook it in a veritable terror; it would not yield. With a bound I reached the ruined clavecin, seized one of the pedals, and tore it away from the machine. The end was armed with an iron point. This I inserted between the lock and the door. I twisted the lock from the worm-eaten wood with one turn of the wrist, the door opened, and I almost fell down the steep steps. The second door at the bottom was also closed. I threw my weight against it once, twice; it gave, and I half slipped, half ran down the winding steps in the darkness.

Out at last into the fresh air of the lower passage. At the noise I made in closing the ponderous door came forth the old custode.

In my excitement I seized her by the arm, saying, "Who was the little old man in the black velvet coat with the ruffles? Where is he?"

She looked at me in a stupid manner. "Who is he," I repeated—"the little old man who played the clavecin?"

"Little old man, sir? I don't know," said the crone. "There has been no one in the tower to-day but yourself."

George Wharton Edwards.

THE TOWER OF GOLD, AND THE PORT OF SEVILLE FROM SAN TELMO.

DRAWN BY HARRY FENN.

AFTER A PHOTOGRAPH BY J. LAURENT AND CO.

## CHRISTOPHER COLUMBUS.

BY EMILO CASTELAR.

### II. IN SEARCH OF A PATRON.

COLUMBUS believed the solid part of the sphere to be larger than the liquid part, and the distance by the sunset road between the East Indies and western Europe to be less than it is.

But in those two capital errors lay the great incentive to the execution and success of his purpose. Had he known the vast planetary spaces covered by the waters; the continent interposed between his own Europe and the land of diamonds, gold, and spices; the difficulty and peril of the passage yet to be braved in the far regions of the antarctic pole in order to sail from our continental Europe to the oriental Indies by the western way, he would perhaps have shrunk back in alarm and dread.

Portugal, as we have seen in a previous article, then stood in the relation to Africa, the East Indies, and the whole ocean that Greece did toward Asia in the days of Alexander. Columbus, endowed with the facility which was possessed by the Italian of that day for entering the service of any nation, became naturalized as a Portuguese; wedded a Portuguese woman; had a Portuguese son; allied himself with families governing Lusitanian territories beyond the seas; pursued the advanced studies of the school and academy of Sagres;

voyaged with his tried mariners from Thule to Guinea; expounded his recently perfected plans, toiled and aspired, with all his powers, to make Portugal great—and Portugal comprehended him not.

Before presenting his plan to Dom John II., Columbus had diligently perfected and revised it in all its details and scope, besides submitting it with true modesty to the scrutiny of learned men. The cosmographer Behaim, a disciple of Regiomontanus, the great astronomer of the century, had constructed a globe showing his concurrence with the theories of Columbus, except that in the place assigned by Columbus to the outlying regions of Asia he had set one of the many lands imagined by the poets and philosophers of old. Toscanelli, a Florentine by birth and schooled in Florence, reputed to be a physician and a consummate cosmographer, told Columbus how he had drawn a map in perfect correlation with the Columbian theories; and assured him of his belief that it would be an easy thing to find a short and safe westward course to the East Indies.

Portugal had not launched forth in her explorations without doubts and opposition. Agricultural Portugal was necessarily at odds with maritime Portugal. The restful elements held to the land, the unrestful gravitated to the sea. There was, therefore, a feudal party of land-

holders naturally opposed to the advocates of navigation. At the head of the former was found the king Dom Duarte and the infante Dom Pedro; at the head of the second the two glorious infantes, Dom Henry and Dom Ferdinand. The great historian Oliveira Martins compares them with Cato the elder and Scipio Africanus. In truth, Cato aimed to confine Rome within her own territory, and Scipio to spread her over all the world.

The king with whom Columbus argued, grandson of Dom Duarte, was all for seamanship, for discoveries, for maritime adventures, for the Odyssey of ocean voyages; and so he fitly reigned over Vasco da Gama and Fernando Magellan. It is, therefore, the more surprising that he did not espouse the scheme of Columbus. Intellectually he was far above his father. He had inherited the crown in his childhood under the regency of Dom Alfonso V., son of the king Dom Duarte. In infancy he was under the tutelage of his mother, Dona Leonora; in youth under his uncle Dom Pedro, whom he slew; in ripe manhood under whatever party, good or bad, might subject him to its interests. He pressed out the blood and sweat of the masses to enrich his nobles, whose unchecked license and wastefulness under his nominal sovereignty made them his nearest friends. He was vainglorious of his title of Africanus, won at the cost of a ruined kingdom and people, upon whom fell the deepest misery through the African enterprises of their unloved king. Corpulent and gross of body, he was strong, brave, combative, and a soldier, yet vengeful and dull. Beaten in the battle of Toro, and after his defeat a fugitive in the land of France, he was succeeded by his son, Dom John II., to whom Columbus was to present his plans.

Ferdinand V., Louis XI., and Henry VIII. seem as one monarch in their greatnesses and their duplicities. To their class Dom John of Portugal belonged by nature, and by the time in which he lived. Perfidy, duplicity, and falsehood, joined to innate cruelty, made up the traits of those Machiavellian kings. Policy in them had dethroned conscience, a thing which often happens among men in periods of agitation and in revolutionary times. Dom John II. was one of the same sort, in conformity with the general laws which produce monarchs identical in character and in tendencies, in far-apart and widely contrasted kingdoms. The chronicler Bernaldez, in the first pages of his "History of the Catholic Sovereigns," truthfully delineates John II. as artful and at the same time cruel. He deemed crimes practicable only within a well-defined limit, that is, just so far as they might be practically useful. Temperate in eating and drinking, sparing of sleep and recreation, an enemy to the ostentations of art and

pagan luxury in which the kings and pontiffs of the age indulged, like the Borgias, the Estes, the Medicis, and the Urbans of the Renaissance, he did his murdering very deliberately and surely.

His idea of the internal unity of the State, to which he paid worship like a good king of an essentially monarchical century, impelled him also, perforce, to undertake voyages and discoveries which begat, by their incessant activity, a class directly opposed to the feudal nobles who depended upon the soil, now impaired in productiveness by the incredible apparition of new lands and by the miraculous influx of new productions; in competition with which they were no longer able to keep up the value of their vast seigniorial estates, whereon the walled castle of the noble reared its battlements, and the gloomy gibbet of the tribute-paying vassal dangled its halter. As a consequence, the political and personal traits of the Portuguese monarch were in accord with the purpose of Columbus, and this tended to inspire him with the fullest confidence in a sure and favorable result.

Had Columbus persistently held out to him the promise of immense dominions, fabulous wealth, and far-reaching empire, Dom John might have yielded to the potent fascination. But the sailor demanded two things, both incompatible with the policy of Dom John—a policy in thorough accord with his nature and his life: he claimed a rich return, which was not tasteful to the covetous king, and great power and authority, incompatible with the royal prerogative, which had risen to supreme dominion and had become an article of faith to be accepted of all men. It was impossible to induce Dom John, who had stripped the Lusitanian nobles of a large part of their revenues, to consent to another's sharing in the profits of the territories to be discovered, and even more impossible to win from him recognition of such a perpetual governorship as Columbus asked: a copartnership, as it were, with himself, who at such cost and by such stern means had set himself upon the backs of his nobles after a struggle so bitter that he had perforce sought aid in it from the infernal powers of crime, to insure the unity, the integrity, and the totality of his monarchy.

The indispensable acceptance of the preliminary and preparatory scheme was therefore frustrated by the same causes that so nearly defeated it afterward, namely, the excessive claims of command and tribute for himself put forward by the sublime discoverer. And as Columbus felt such an assured confidence in the realization of the project; as he so clearly foresaw the finding of fabulously rich regions by the mere act of sailing westward, and not south-

ward as the Portuguese had hitherto sailed; as he touched with his own hands the walls of gold, held in his own grasp handfuls of jewels, and with his own eyes beheld the minarets of rubies and emeralds, so he held obstinately and with unexampled fixity of purpose to his demand for the recompense of power, wealth, and honors, with an assurance so marked as to be at times almost petulance—a feature repugnant to all men and especially to a man so self-satisfied as the king Dom John II. Christopher Columbus laments this, and says: “I went to make my offer to Portugal, whose king was more versed in discovery than any other. The Lord bound up his sight and all the senses, so that in fourteen years I could not bring him to heed what I said.” Nevertheless the king appointed a commission to look into the matter; and this commission rendered an opinion in perfect consonance with Lusitanian precedents, which were all in favor of seeking southern Africa and the East Indies by shaping longer courses toward the south. Two learned doctors, Maestro Joseph and Maestro Rodriguez, jointly with the two prelates of Ceuta and Visu, were the members of the commission which was charged with that most difficult investigation.

But Dom John could not have been satisfied with the adverse report of the wisacres, for he called together the High Council of the crown. This body, essentially political, composed in greater part of those jurists to whom the science and knowledge of the Roman law suggested the modern idea of absolute power and the creation of powerful States, set aside the purely scientific views of the commission of technical cosmographers, and laid stress upon the pretensions to authority and revenue advanced by Columbus, deeming them in conflict with the supreme rights of the monarchy and the absolute power of the monarch. In truth, the technical junta and the political council assigned the two motives of refusal—the usual course of the Portuguese voyages and discoveries, and the recently established principle of monarchical unity. One report opposed the project itself, the other opposed the reward demanded by Columbus. And now arose the design in the mind of Dom John to appropriate the Columbian achievement and to get rid of Columbus.

By the detailed explanations of the project, by his frequent conferences with the discoverer, by the consultations held with the wisest men of the century, by the data collected for drawing up the report, Dom John had learned all that it was possible for him to learn; and he straightway put it into practice. He summoned the most expert among the Portuguese pilots, Pero Vazquez, the school-fellow of Dom Henry, and in stealth and silence, with all secrecy and caution, sent him, under pretense of provision-

ing the Cape Verde Islands, to follow the course mapped by Columbus. Then was it clearly apparent that mechanical and superficial knowledge, mere calculation, the soldier's watchword and the king's command, could not take the place of the effort, the zeal, the research, the reasoning, and, above all, the sorrows of a true genius. The merely mechanical pilot was terrified when he became entangled in the sea of floating sargasso, whose rank growth clung to the keels and checked his progress; he was more terrified when struck by tempest and hurricane, and yet more on sailing and sailing, day after day, without sighting land; and in his terror he put about, steering homeward to Portugal, and excusing his failure by exaggerating the peril. The secret became known. As soon as Columbus knew of it, his indignation, only comparable in intensity to his protracted forbearance and the long trial of his patience, moved him to rebel and to quit Portugal.

BEING naturally cut wholly adrift at that time from his own country, Genoa,—whose ventures by sea and land were not calculated to advance his projects,—Columbus turned his thoughts toward Spain, which, after the feudal disorders of the reign of John II. and Henry IV., was then beginning to shine again with that new, persistent, and constant splendor which, following all her decadences in every period of her history, reveals her to us as a self-luminous sun—a sun, indeed, over whose face the dark shadows of many eclipses pass for a season, but ever leave the glorious luminary unquenched. In addition to the natural attraction exerted upon all elevated minds by our country at that time, a particular and personal fact had a very powerful influence on the purpose of the Genoese in coming, in his hour of disappointment, to seek a dwelling beneath our roof-tree—the death of his wife, who left to him a son, Don Diego. With him for sole companion and support, Columbus set out from Portugal on the road to Estremadura and Andalusia, whether by sea or land we know not, in search of a sister-in-law who had married an obscure Andalusian, as well as of relatives in Seville.

A sailor, filled with the purpose of seeking the path to the Indies by the westward way, turned naturally for support to Spain and Portugal. Venice and Genoa were then still looking eastward, whilst Seville and Lisbon looked to the west. Notwithstanding the marvelous Lusitanian discoveries of that century, our country had an advantage over Portugal, in that she had far anticipated her in maritime exploration and discovery. From the era of the Germanic conquest to the century of the first crusades, the intellectual paralysis that smote

the European world did not reach our Spain. She lay bathed in the flood of universal life and in the light of learning, thanks to the progressive and wise schools, half Spanish, half Arabian, of enlightened Andalusia. The Alabderite wrote in Valencia an itinerary of Africa; while in Seville Abzeyat the Sage painted the maps of the new cosmography; and the geographical treatises of Albufeda went so far beyond those of all other geographers that it was impossible without his aid and his statements to undertake any voyage whatever, as is admitted by the commentators on the voyages of Marco Polo, from whose narrative Columbus imbibed his greatest and most brilliant hopes. True it is that the story of Marco Polo, so calculated to spur the reader to voyage and discovery, had been anticipated a full century by the Jew Benjamin of Tudela, who, confiding in the assurance derived from his scientific acquirements, was not content with exploring the archipelagos of the Asian seas, but penetrated to Tartary and Mongolia, then the object of a lively curiosity and the fountainhead of innumerable fables, thus keeping alive the investigative science of the world beneath the dense shadows of ignorance, which had become almost invincible by reason of the obstacles interposed in the path of exploration and discovery by a general state of warfare and by the breaking up of nations into fragments.

And so it is that we would fail to understand Spain's work of discovery did we not with true foresight first discern the gleams of enlightenment left in Spain by the Arabs. But, if the ideas of the Arabs shone conspicuously in times so antagonistic to learning as the period stretching from the seventh to the twelfth century, in this latter century the Christian monarchs of Spain began to encourage the study of the heavens, and maritime explorations as well, on the one hand founding schools to take the place of those which had been abolished in Cordova and Seville, and on the other sending forth ships, which, under color of warfare, disseminated precious and fruitful germs of barter and commerce. Coincident with the first ships of Guadalquivir that joined in the assault and siege of Seville were the first astronomical tables of Alfonso the Wise, that from the plains of Toledo revealed the secrets of the sky. Ferdinand III. rewarded his sailors, who, stimulated thereby, went forth to succor foreign nations, in like manner as foreign ships had come, scarce a century before, to our aid in the siege of Almeria under Alfonso VII. With this revival of maritime power came the development of two marvelous ancient cities, founded long ago by the Phenicians and the Carthaginians on our southern shores — Barcelona and Seville, the one looking toward the

Orient and the other to the Occident, the first emulating Venice and Genoa, and the second rivaling with Lisbon and Oporto, whereby a double peaceful legion of traders and mariners enabled us to take possession of Naples and Sicily in the Italian seas; to lend aid to Constantinople and Athens in the Hellenic waters; to set in Asia Minor the barred blazonry of Aragon; to venture forth to dominate the Atlantic with our keels, and bring within the sphere of the general commerce of Europe those Fortunate Isles, seemingly fragments of the fabled world, long since perished, wherein the thinkers and the poets of old time laid the scene for the miraculous realization of their utopian dreams.

And this work of progress halted not a jot, even in adverse reigns; for his family wars and his usurpations of royal rights hindered not Sancho IV. from felling forests and launching fleets of ships; nor Ferdinand his son, amid the conflict with his nobles and their appeal to the wager of battle before divine justice, from founding such prosperous marts of trade as Bilbao; nor the ninth Alfonso, amid his combats with the Moors in El Salado, and his legislative cares at Alcalá, from favoring the municipal councils and exempting them from the royal tribute; nor Pedro the Cruel, amid the horrors inseparable from his sanguinary struggle with the feudal party under the leadership of his bastard kinsman, from equipping fleets and embarking in person in search of new peoples and new shores; nor John I., amid the disasters of his wars with Portugal, from despatching embassies, even to the mouth of the Euphrates, to plead with the Sultans of Babylon in behalf of the captive Armenian kings; nor Henry III., despite the weakness inseparable from the decadence of the monarchical principle and the insolence of the feudal power, from stretching out his hands to grasp the region known as the Roof of the World, by means of the envoys he sent to the great Tamerlane of Persia and the Grand Mogul of Tartary, in quest of tidings of the descendants of that Indian Prester John, whom the fables of the thirteenth century pictured as praying for Christian succor beneath a canopy of woven gold, and upon a pavement inlaid with emeralds; nor John II., despite the enemies stirred up about him by the favorite Alvaro de Luna, that instigator of seditious popular uprisings, from receiving the covenant of homage from the recently conquered Canaries, and sheltering them from the greed of Portugal; nor Henry IV., amid the scandals of his life and of his court, from giving protection to ships and travelers upon the sea; nor the Catholic sovereigns, Ferdinand and Isabella, despite the difficulties which beset the beginning of their reign,

from collecting the fifth part of the wares sold in Guinea as though it were their own possession, or from maintaining a foothold in Sierra Leone, or from promoting the constant exchanges of trade and the opening of mines in Mina de Oro, and thus, by this series of long-continued creative efforts preparing the way for our country to undertake the paramount achievement of her history, and to demonstrate for all time the rotundity of the earth: a task to be likened, in its vastness and transcendency, to the divine work of creation. The logic, therefore, of all our historic deeds, the sum of all Castilian achievement, the teeming fruit of the development of long ages, the well-known daring of our race, and the manifold exigencies of our geographical situation, made it inevitable that, even as the Egyptians enlightened and taught the Hebrews; even as the Phenicians enlightened the Greeks and founded Carthage; even as the Greeks laid the foundations of Latin culture and the Carthaginians built their famous cities upon the shores of this Spain of ours; even as the Latins dominated the Helvetians, the Britons, the Batavians, and the Germanic tribes, so Spain, set on the uttermost confines of the sunset lands of Europe and dowered with a mighty civilization, was to search out every sea and reveal the whole planet. And inasmuch as the fulfilment of so vast a destiny pertained to all our being and to all our history, so, in the fullness of time, Christopher Columbus, the revealer, came to our chosen and pre-destinate land.

THE determination of Columbus to come to Spain, and his sojourn among our people, have been so overlaid, in the course of centuries, with fables more or less derived from the real truth, that a frank, simple, and truthful narrative of the ascertained facts is very difficult. To most historians, it seems as though the dramatic interest of an illustrious biography needs the brilliant gloss of fancy, and is diminished by the truth; and so they surround the facts with a thousand exaggerations of the obstacles suffered by Columbus. It is enough that he endured the neglect of his own country; the cold aversion of so enlightened a city as Venice; the treachery of Dom John II. at Lisbon; the weary voyages to Iceland and Guinea that demonstrated the correctness of his deductions, and yet passed unheeded by the mass of those who remained wedded to traditional errors; and the dense blindness of all around him to the proofs collected by his tireless endeavors. To these trials we need not add the curse of such utter poverty as to force him to beg alms from door to door, and to leave his children, reared in misery like wretched foundlings, to the care of some house of charity or penitence. Co-

lumbus remained in obscurity; he was strangely unrecognized if we regard his intrinsic mental endowments and the almost supernatural merit of his project, but not so much as to fall to the low state of a common beggar and to stand in need of public charity.

Columbus supported himself for a long time by his voyages and by the labors connected with his trade. The failure to appreciate his merit never went so far as to degrade the man himself. During his stay in Portugal he was able to make a voyage to the torrid zone and one to the glacial; to ally himself by marriage with illustrious houses; to correspond with learned men of the high repute of Toscanelli; to observe in the archipelago of the Azores and in the Eden-world of Madeira the extent of the Lusitanian discoveries; to study, in the ripeness of his life, the relations between the nautical sciences and the astronomical teachings of the schools of the Algarves as demonstrated by our astrolabes; to live by vending maps and scientific instruments; to hold intercourse with the King of Portugal on many occasions; and even to run in debt to his numerous friends. Therefore there is no need to judge him in the light of some wandering bard, begging his daily bread from door to door. That he drew the minds of men to him, that he was the object of general attention, that he spread around him the influence of his merit, is evident, if we merely consider how many times the public authorities examined those schemes of his which some writers deemed to have been received and requited with scornful derision. Still, the plans of Columbus opposed so great a mass of novel ideas to the common beliefs of his time, that we of to-day need not marvel at the repugnance they aroused and the opposition they encountered.

Columbus must have felt great confidence in his own merit, and have gained much esteem thereby, to enable him on reaching Lisbon to gain access to the Portuguese sovereigns. He came thence to Seville, and was able to reach even the courts of the Andalusian magnates. Being very widely dispersed in their glorious fifteenth century through all the great cities of western Europe, Italians stood in much repute by reason of their arts and their learning, and were as highly esteemed for their worth in Seville as in Lisbon. And so, as a letter of the Italian, Geraldini, sufficed in Lisbon to call forth the celebrated epistle of Toscanelli which so greatly assisted Columbus, so likewise a letter of the Florentine Berardi, the head of a great mercantile house in Seville, opened to him the doors of the palace of the Duke of Medina-Sidonia in the Andalusian capital, and of the palace of the Duke of Medinaceli on the Bay of Cadiz, the latter a magnate of the royal blood

unmixed with the impure and bastard strain of the Transtameres as was the blood of the Castilian monarchs, and the former a commander of many feudal forces that rivaled in strength the armies of the king himself.

Who among us can picture yonder Seville, as it was when Columbus came to its embrace toward the end of the fifteenth century? The eternal surroundings of the city will ever preserve their undying loveliness, but as to the town itself a thousand circumstances peculiar to that historic time filled it with activity and life. Let us, then, disregard the blandness of its climate; the purity of its skies; the breezes heavy with odor of azaleas and jasmines; the echoing strains of Moorish *guzlas* heard in voluptuous serenades; the crystal windings of that famous river which the Arab poets compared with the mightiest floods of the Orient; the towers builded by the Almohades, adorned with many-colored tiles, shining like virgin gold mingled with precious gems; the graceful Giralda, bright with airy arabesques; the churches where the skilful Moorish artisans had set their inlayings and fretted work around our saintly statues; the cathedral, lifting heavenward its nearly completed fabric; the palaces, miracles of stucco-work, where the new-found statues of ancient times and the newly hewn works of later sculptors crowded arched galleries of Moorish design; the marble courts, like grottoes of bliss, filled night and day with the splash of fountains and the strains of melody; the slender-columned, double-arched windows, festooned with garlands of rosy blossoms; the minarets where the swaying bell replaced the muezzin's cry; the wondrous Alcazar, laden with poesy; the gardens thick with lemon-trees and cedars; the groves wherein the bright-needled pine mingled with the somber-leaved olive; the doors of rose-colored larch inlaid with stars of ivory; the belting walls, tinged coral-purple in the bright air of Andalusia, all glowing with beauty, and instead let us give closer heed to the ideas and interests then concentrated in Seville by reason of its rank as the capital of the region where at that time the last war against the Moors was being waged, as well as the capital of the new possessions we had gained in the Gulf of Guinea and on the Gold Coast, and by the final acquisition of the Canaries.

The city was thronged with soldiers and men of gentle blood, with courtiers, learned men, merchants, and mariners; it possessed great schools and well-equipped factories, and withal exhibited such a concentration of ideas and interests as perforce must have aroused in Columbus a flood of new ambitions, and spurred him on to accomplish his varied schemes. The fancy of the discoverer, too, must have been

excited by the thoughts which filled that sea of vivid inspirations. The westward way, of which he ever dreamed, was to be lightened by the endless voyages of the ships he saw mooring at the foot of the Golden Tower after their voyage from shores not far from those which the belief of the pilot's day declared to be the confines of habitable land. About him he beheld the movement of trade and barter in such wares as were then in demand, sent forth from Spanish workshops to every land: an abundant production of rich silks; the great hydraulic works whose invention had been so lavishly rewarded by the State; the private banking-houses of such men as the Italian Amerigo Vespucci; the professorships and schools of cosmography and navigation; the great improvements made in draining the lowlands by mechanical means and even in rendering the brackish waters potable—all these practical surroundings must assuredly have fostered the experimental cast of mind which in Columbus tended, by deep research and observation, to fortify the sudden intuitions born of his native genius and his prophetic hopes. Thus, during the period of his life passed in incomparable Seville, after a long sojourn of fruitless inaction in Cordova, the plans of Columbus must have been aided greatly by the stimulating influence of the many scientific and industrial developments which then existed in a city whose sole western rival was the splendid and opulent Lisbon. But, after all, the chiefest furtherance afforded to his project in Seville lay in the opportunities there opened to him to meet and confer with the rich and powerful Italian bankers, who in turn enlisted in his behalf the friendly attention of magnates like the Duke of Medina-Sidonia and the Duke of Medinaceli; who, becoming more or less interested in the schemes of the pilot, more or less pledged toward their realization, and more or less enthusiastic in their behalf, joined in presenting and accrediting them before the royal court.

It is difficult—extremely difficult, almost impossible—to fix the years of Columbus's life spent in Cordova, in Granada, in Huelva, in Palos, in La Rabida, in Seville—places certainly visited by him and even the scenes of extended sojourn, although the historian is unable to assign the date of his presence in the more important of them. From the outset, his journey to Spain and his stay in that country were in obedience to the thought that such an undertaking as his could not prosper without the abundant resources at the command of a powerful State. Spain was well governed and great under the wise rule and intelligent policy of the Catholic Sovereigns. So he came to Spain in 1485.

After his failure in Portugal, the Seigniory of Gênoa, the Council of Venice, the principal kings of western Europe passed by day before his waking eyes, and filled his brain through the long sleepless nights. Whenever he saw himself baffled, he was in the habit of using an oft-repeated phrase, such as we in Spain popularly call a *muletilla*. "I will hand over my discovery to the King of France," he would say, almost mechanically. Under the pressure of such motives, during the first year of his stay in Spain, he sent his brother Bartholomew Columbus to the King of England in quest of aid for his undertaking. Bartholomew, like Christopher, by his wide knowledge ranked high among cosmographers, and by his tireless and consummate skill among the best pilots of that century, thus sharing in the attainments but not in the material prestige and the mental inspiration that so highly distinguished his brother, whom he outranked only in such secondary qualities as dissimulation, then so indispensable in public affairs, in sagacious discernment, and in keen and ceaseless astuteness. Bartholomew fell into the hands of corsairs, and, chained to the oar, passed for many months from sea to sea, and from shore to shore, in misfortune and bitter hardships. Nevertheless, at the beginning of 1488, three years after his brother's coming to Spain, he reached London, and sketched, in more or less fantastic detail, upon a colored chart of the world, the predicted and promised lands, with explanatory legends in macaronic Latin verses as a sort of compendium, fortified by the citation of such authorities as King Ptolemy, Strabo the geographer, Pliny the naturalist, and Saint Isidore the sage, all of them agreeing, although in different ways, in predictions identical with those so often uttered by the contemned and unheeded Columbus. Henry gave Bartholomew several audiences, and was pleased to listen to him attentively; although, while taking good care not to dishearten him and rather keeping his hopes alive, he had no real mind to aid in their realization. Two circumstances prevented the monarch from decisive action, one personal, the other external, the latter being the constant anxiety springing from his untiring efforts to hinder the revival of the ancient wars between the houses of York and Lancaster, while the personal motive was his inordinate greed. The outcome, in the inevitable logic of events, proved anew how neither talent, nor perseverance, nor foresight, acting through subordinate and inferior agents, can attain the success reserved for the force and might of genius.

At an unpropitious time the worthy Bartholomew went to the English court, and in a still more inauspicious hour came the great Columbus to the court of Spain. The Catholic

Sovereigns, from the time they mounted the throne until 1488, had been between the hammer and the anvil. On the one hand, the King of Portugal, Alfonso V., gave them no peace with what in fact were civil wars to win the throne for his niece La Beltraneja; while on the other the French king, Louis XI., harassed them by keeping up a continuous foreign war, and forced them to constant readiness against sudden attacks throughout their dominions. To these contests and wars with their neighbors to the east and the west were added the death-throes of the feudal monster, let loose when the Transtameres ascended the throne, and seeming to gain renewed life from the blows dealt upon its head by the monarchical power, restored by the new sovereigns. In Galicia the agricultural and landed feudal interests were in open revolt under the Count of Lemus, while in the Andalusian region a warlike feudalism, led by many powerful nobles, opposed their path toward Granada, contesting their authority and disputing their rule in a fractious spirit that was more grievous than open hostility to sovereigns such as these, who sought to win all their royal rights by glory and good government.

When the great pilot came to present his claims and his plans, the royal power was not yet fully established; neither was authority enforced over the nobles, who traversed all Castile at will in tempestuous forays and stormy warfare; nor peace imposed upon the restless neighbors in arms, who kept up as it were a close siege against the double crown of the royal pair; nor a settlement reached of the quarrels between the troops of the monarchy and the feudal forces, assembled on the plains of Andalusia to attack the remnant of the Moors; and Columbus necessarily found invincible obstacles in the way of his project, no less by reason of these perturbations than by the utter absorption of all minds and all efforts in the war upon Granada, and also because of the enormous costs attending that vast undertaking. At that time, when the outcome of the contest between the monarchical and feudal principles was still undecided, only the first steps had been taken toward the organization of a standing army, and the systematic raising of revenues had not yet been begun, and indeed had not even been devised, so that it was impossible to provide resources, and still more so to raise ready cash, for any other great purpose or foreign venture. That nothing might be lacking to the impediments in the way of the success of so audacious a proposal and so complex a scheme, there was not even a fixed capital city. The sovereigns went to Santiago, Seville, Segovia, Cordova, Medina, Barcelona, Toledo, Madrigal, Pinto, Madrid,

and Valencia, as public affairs called them; but abode in no one place. Hence the difficulty Columbus met in gaining access to them in order to submit his project in all its scope; nor could he win any promises from them, however vague and indefinite.

In the year of the discoverer's arrival, in order to bring about religious concord, and to aid the monarchical unity they so greatly desired, the sovereigns had founded the tribunal of the Inquisition; but not without meeting with resistance such as stained with blood churches like that of Seo, at Saragossa, where the mob murdered an Inquisitor in the self-same spot where in later years an altar was reared to his worship as a martyr. And as in that year the Catholic Sovereigns founded the Inquisition as a means to enforce Catholic unity, so likewise they vowed to uproot from their country's soil the last vestige of Moslem rule. How unfortunate the coincidence! How was it possible, in the midst of those paramount efforts to bring so many races within the pale of one religion, to impose the monarchical idea upon so many feudal organizations, and to compel the still formidable Moors to obey a national unity, that success should crown a project like that of Columbus? In this wise may be explained the sad, dark days, and even years, that followed the coming of Columbus among the Spaniards, until his melancholy made him in the eyes of men almost a living specter; until his features, reflecting the sorrows of his heart, were as those of a soul in torment come from the other world; and until, on beholding him, wrapped in his one thought, his garb disordered in the abandonment of his despair, plodding the public streets and pacing the cloisters of the cathedrals, journeying one day to Cordova and another to Seville in search of some noble or some influential ecclesiastic, the people mocked him with pointed finger, and took him for a madman.

He had then barely attained the age of forty-nine, and, in his loneliness, craved another soul with which to hold converse. In love alone does existence find a perfect calm. In Cordova he formed friendships in the household of Enriquez y Arana, a person of very ancient lineage and of slender fortune. As a result of this intimacy he became attached to a young girl as intelligent as she was beautiful. It is established that, from the eighty-eighth year of that century, when he came to Spain, until 1492, when he set out on his first great voyage, Columbus resided in Seville, in Cadiz, in Huelva, and in Lisbon, but his stay in Cordova was longer than in any of these. As we have already seen, the Ultramontane school of Europe proposed to recognize the Columbian discovery as a miracle and to enroll its author in the

celestial court. But the loves of Christopher Columbus and Beatrice Enriquez Arana disturbed them in this purpose, being clearly unsanctified by the sacraments of the Church and illegitimate under the civil laws. Scarce knowing how to extricate themselves from this untoward strait, they married the long-dead lovers, who in their lives had neither cared to marry nor been able to wed; and so they made them lawful husband and wife. The customs of the Renaissance permitted this class of natural affinities, much as the modern advocates of free love seek to recognize them. A class of descent, not recognized by the strait morality of our codes, was frequently admitted under the old Spanish laws. Four years after the father came to Spain a son was born to Beatrice and Columbus, whom they named Ferdinand. A brother of Beatrice was the constant companion of Columbus. The doubloons of Beatrice and her family helped to supply the necessary expenses of preparation for the great undertaking. Even in the family records of the second generation we come across statements of arrears in the contracts between the two households, and notes of money payments for debts of this class, mysteriously contracted and still undischarged. Friends like Padre Las Casas, men of orthodox austerity, speak of Ferdinand with reticent insinuations, which leave no room for doubt as to the nature of the love of Columbus and Beatrice. For some two years he gave no sign of life among us, as though time were lacking for the enjoyment of so vast a happiness as he found in Cordova.

The Italians of the Renaissance, because of their recognized intellectual superiority over the races of central Europe, were to be found everywhere, like the Greeks throughout the East, as guides and masters of the very peoples to whom, as subjects or bondmen, they owed submission and obedience. Consequently they resorted to Lisbon, to Seville, to every point where the concentration of ideas or of traffic attracted general activity. And there is no doubt of the truth of what we have already said, that they, and they alone, assisted the relations of the pilot with the great lords then virtually the sovereigns of Andalusia. Columbus did well to court the favor of the Guzman who at that time ruled the domains comprised in the dukedom of Medina-Sidonia. Numberless coronets, useless to a brow already sufficiently crowned with the feudal casque, were at his iron feet; the manifold tribute of innumerable serfs filled his coffers, which were, besides, heaped with the abundance of the spoil wrested almost daily from the wealthy Moors in endless forays and countless depredations. A strong land force surrounded his fortresses, about each of which lay a vast encampment, while a fleet ever at his

command rode in the estuaries of his rivers and sailed along the coasts of his seigniorial seas. An infinite extension of his domains, a boundless harvest of new wealth, a fresh field open to his native heroism, a sea hitherto unexplored spread before his eagle eyes, could not fail to tempt him; and yet these did not move him to action because of the terrible strife waging between the aristocratic classes and the monarchical power during the important five years preceding the coming of Columbus to Spain, and during the subsequent five years of his sojourn there. A better opening was doubtless afforded to Columbus by negotiating with the Duke of Medinaceli, who was not so conspicuously a warrior and feudal champion as the adventurous Medina-Sidonia, and who was, besides, more inclined toward maritime expeditions. The duke dwelt by the sea, in Puerto Santa Maria, from whose wharves and roadstead many expeditions had been despatched, not only to explore the African mainland, but also to discover and occupy the Canarian archipelago, composed of constellations of lovely isles known in every tongue by the fitting epithet of "Fortunate." By the ancient alliance of the houses of Medinaceli and Coronel, the domain of the ducal family embraced all the territory stretching between the mouths of the Guadalquivir and the Guadalete, comprising the beautiful tongue of land that projects into the marvelous Bay of Cadiz, facing the city. Few spots were so well adapted to be the hospitable refuge of an explorer like Columbus, and to furnish him with incentives to far-seeing plans and with subjects for deep meditation.

The prince Louis La Cerda, who flourished at the beginning of the fourteenth century, claimed the Canaries, mysteriously divined to be a halting-place in the pathway to larger ventures. Pope Clement VI. proclaimed him sovereign over those islands, and bestowed on him the title of Prince of Fortune. But although he went not thither to reign, and although the glory of attaching the Fortunate Isles to the Castilian crown passed to Juan de Bethencourt, an inherited germ of propensity to maritime exploration remained in the duke who at the time was head of that kingly house. Possessing this hereditary instinct, he welcomed Columbus as one sent from heaven, and made him his guest, in the firm assurance that he would bestow upon him a kingdom, for the long course of centuries had not extinguished in the house of La Cerda the constant aspiration to reign. Medinaceli possessed in his castle every resource then known to science, and at the foot of his water-stairs that dipped beneath the waves, under the shadow of his royal blazonry, lay the caravels which Columbus solicited in order to lend material wings to desires now quickened by the pros-

pect of practical accomplishment. The duke had promised them to him, and he impatiently claimed them. To the magnate nothing seemed easier. And yet the phase through which Spanish society was then passing, that evolutionary movement for the establishment of monarchical unity in place of feudal heterogeneity, prevented the realization of the ambitious dreams of Louis La Cerda and the practical dreams of Christopher Columbus. If Ferdinand the Catholic would not accept Medina-Sidonia's aid before the walls of Alhama, in so bitter a strait for the Christians as was the investment of the city of Hacem, would he have consented to the equipment of caravels, the enlistment of sailors, the discovery of new lands, and the creation of eminent dominion beyond the shadow of the throne and beyond the controlling reach of the scepter? Although the duke and Columbus lived for some time together beneath the same roof, and studied sea and sky with the same astrolabes, and shared their thoughts in common, and displayed equal zeal in making preparation for the work, they speedily realized that under so imperious a monarchy such mighty undertakings were not to be essayed by any private subject, and especially by any noble. Medinaceli gave the discoverer letters of recommendation to men of influence in the royal court, and as his sire renounced the kingly crown, so did he renounce the crown of his dreams. This was the first step toward the intervention of the Catholic Sovereigns.

Bearing the commendatory letters of the duke, Columbus seems to have gone from Puerto to Seville, and from Seville, where the accustomed favors of the wealthy Berardi as well as of the influential brothers Giraldini did not fail him, he appears to have passed to Cordova. The first person he approached in order that the closed portals of the palace of the sovereigns might be opened to him was the accountant-general, Quintanilla. A calculating and precise man was he, constantly occupied with the many cares of his difficult office; singularly versed in financial science for his time, and most watchful of the interests of the enfeebled and anemic treasury of his sovereigns, which was nearly always empty. He took a fancy to Columbus from the first, and their mutual liking brought close together the visionary idealist and the practical dispenser of needed resources. Quintanilla, being thus strongly interested in the pilot's behalf, deemed his own efforts insufficient for the bold adventure, and applied to Cardinal Mendoza, in whom wealth was joined to learning, to the arts, and to political sagacity—a combination frequent among those powerful magnates of the Renaissance—and who was in a position to lend Columbus active assistance. Mendoza, styled the Great Cardi-

nal, accustomed to the promotion of high empires in Castile, was impressed by the scheme of Columbus and furthered it so far as he was able. Men indeed called Mendoza the "Third King of Spain," as though he were a person of the royal trinity, of equal standing with Queen Isabella and King Ferdinand, and sharing the crown with them. This prince of the church, when he resolved upon a thing, went about it in formidable earnest. So, in his firmness of will and daring of purpose, he boldly and zealously favored Columbus, and even determined to associate himself with him. In like manner as the Berardis had introduced Columbus to Medinaceli, so did Medinaceli give him urgent letters of recommendation to Quintanilla, and so did Quintanilla, in turn, to Cardinal Mendoza, who, for his part, espoused his cause with the Catholic Sovereigns. Owing to the careless indifference natural to that time and race, no one can fix with certainty the day or year when the sovereigns first received Columbus in personal audience; but, by inferences consistently drawn from the later writings of Columbus, we may believe the time to have been about January in the year 1487.

Columbus was of powerful frame and large build; of majestic bearing and dignified in gesture; on the whole well formed; of middle height, inclining to tallness; his arms sinewy and bronzed like wave-beaten oars; his nerves high-strung and sensitive, quickly responsive to all emotions; his neck large and his shoulders broad; his face rather long and his nose aquiline; his complexion fair, even inclining to redness, and somewhat disfigured by freckles; his gaze piercing and his eyes clear; his brow high and calm, furrowed with the deep workings of thought. In the life written by his son Ferdinand we are told that Columbus not only sketched most marvelously, but was so skilful a penman that he was able to earn a living by engrossing and copying. In his private notes he said that every good map-draftsman ought to be a good painter as well, and he himself was such in his maps and globes and charts, over which are scattered all sorts of cleverly drawn figures. He never penned a letter or began a chapter without setting at its head this devout invocation: "*Jesus cum Maria sit nobis in via.*" Besides his practical studies he devoted himself to astronomical and geometrical researches. Thus he was enabled to teach

mathematics, with which as with all the advanced knowledge of his time he was conversant, and he could recite the prayers and services of the Church like any priest before the altar. He was, as I have already said, a mystic and a merchant, a visionary and an algebraist. If at times he veiled his knowledge in cabalistic formulas, and allowed his vast powers to degenerate in puerile irritation, it was because his own age knew him not, and had dealt hardly with him for many years—from his youth until he reached the threshold of age—without taking into account the reverses which darkened and embittered his later years. Who could have predicted to him, in the midst of the blindness that surrounded him, that there in Spain, and in that century of unfading achievement, the name of Columbus was to attain to fame and unspeakable renown? There are those who hold that all this was the work of chance, and that the discovery of America was virtually accomplished when the Portuguese doubled the Cape of Good Hope. But I believe not in these posthumous alterations of history through mere caprice, nor in those after-rumors of the discoverers who died in obscurity. As there be some who have written of the Christianity that existed before Christ, so there be some who prate of the New World discovered before Columbus. Columbus was doomed to too desperate and difficult a task by the general sentiment of his time and by the customs of the generations in which he lived, for history to add a crowning wrong against his fame.

Few creators have divined the transcendency of their creations. Lope de Vega knew not that his fame would rest, not on the elaborate dramas that bear the seal of his learning and erudition, and are constructed with almost servile conformity to the antique unities, but on the plays written to suit the popular taste. The hemlock-poison is in the dregs of every cup of immortality held to the lips of genius! Copernicus would have been burned at the stake had his system been published twenty years before his tardy death, instead of reaching his hands, printed and finished, while he lay on his death-bed amid the gathering shadows of his last agony. The press of Gutenberg was taken from him, as from Columbus the name of his own America, but in abundant recompense they both hold fast to the eternal heritage of their glory.

## A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

XX.

AS the Miss Sahib any orders?" asked Dhunpat Rai, with Oriental calmness, as Kate turned toward the woman of the desert, staying herself against her massive shoulder.

Kate simply shook her head.

"It is very sad," said Dhunpat Rai, thoughtfully, as though the matter were one in which he had no interest, "but it is on account of religious bigotry and intolerance, which is prevalent mania in these parts. Once — twice before I have seen the same thing. About powders, sometimes, and once they said that the graduated glasses were holy vessels, and zinc ointment was cow-fat. But I have never seen all the hospital disembark simultaneously. I do not think they will come back; but my appointment is state appointment," he said, with a bland smile, "and so I shall draw my offeshal income as before."

Kate stared at him. "Do you mean that they will never come back?" she asked falteringly.

"Oh, yes — in time — one or two; two or three of the men when they are hurt by tigers, or have ophthalmia; but the women — no. Their husbands will never allow. Ask that woman."

Kate bent a piteous look of inquiry upon the woman of the desert, who, stooping down, took up a little sand, let it trickle through her fingers, brushed her palms together, and shook her head. Kate watched these movements despairingly.

"You see it is all up — no good," said Dhunpat Rai, not unkindly, but unable to conceal a certain expression of satisfaction in a defeat which the wise had already predicted. "And now what will your honor do? Shall I lock up dispensary, or will you audit drug-accounts now?"

Kate waved him off feebly. "No, no! Not now. I must think. I must have time. I will send you word. Come, dear one," she added in the vernacular to the woman of the

desert, and hand in hand they went out from the hospital together.

The sturdy Rajput woman caught her up like a child when they were outside, and set her upon her horse, and tramped doggedly alongside, as they set off together toward the house of the missionary.

"And whither wilt thou go?" asked Kate, in the woman's own tongue.

"I was the first of them all," answered the patient being at her side; "it is fitting, therefore, that I should be the last. Where thou goest I will go — and afterward what will fall will fall."

Kate leaned down and took the woman's hand in hers with a grateful pressure.

At the missionary's gate she had to call up her courage not to break down. She had told Mrs. Estes so much of her hopes for the future, had dwelt so lovingly on all that she meant to teach these helpless creatures, had so constantly conferred with her about the help she had fancied herself to be daily bringing to them, that to own that her work had fallen to this ruin was unspeakably bitter. The thought of Tarvin she fought back. It went too deep.

But, fortunately, Mrs. Estes seemed not to be at home, and a messenger from the Queen-mother awaited Kate to demand her presence at the palace with Maharaj Kunwar.

The woman of the desert laid a restraining hand on her arm, but Kate shook it off.

"No, no, no! I must go. I must do something," she exclaimed almost fiercely, "since there is still some one who will let me. I must have work. It is my only refuge, kind one. Go you on to the palace."

The woman yielded silently, and trudged on up the dusty road, while Kate sped into the house and to the room where the young Prince lay.

"Lalji," she said, bending over him, "do you feel well enough to be lifted into the carriage and taken over to see your mother?"

"I would rather see my father," responded the boy from the sofa, to which he had been transferred as a reward for the improvement he had made since yesterday. "I wish to speak to my father upon a most important thing."

"But your mother has n't seen you for so long, dear."

"Very well; I will go."

"Then I will tell them to get the carriage ready."

Kate turned to leave the room.

"No, please; I will have my own. Who is without there?"

"Heaven-born, it is I," answered the deep voice of a trooper.

"*Achcha!* Ride swiftly, and tell them to send down my barouche and escort. If it is not here in ten minutes, tell Sirop Singh that I will cut his pay and blacken his face before all my men. This day I go abroad again."

"May the mercy of God be upon the heaven-born for ten thousand years," responded the voice from without, as the trooper threw himself into the saddle and clattered away.

By the time that the Prince was ready a lumbering equipage, stuffed with many cushions, waited at the door. Kate and Mrs. Estes half helped and half carried the child into it, though he strove to stand on his feet in the veranda and to acknowledge the salute of his escort as befitted a man.

"*Ahi!* I am very weak," he said, with a little laugh, as they drove to the palace. "Certainly it seems to me that I shall never get well in Rhatore."

Kate put her arm about him and drew him closer to her.

"Kate," he continued, "if I ask anything of my father, will you say that that thing is good for me?"

Kate, whose thoughts were still bitter and far away, patted his shoulder vaguely as she lifted her tear-stained eyes toward the red height on which the palace stood.

"How can I tell, Lalji?" She smiled down into his upturned face.

"But it is a most wise thing."

"Is it?" asked she, fondly.

"Yes; I have thought it out by myself. I am myself a Raj Kumar, and I would go to the Raj Kumar College, where they train the sons of princes to become kings. That is only at Ajmir; but I must go and learn, and fight and ride with the other princes of Rajputana, and then I shall be altogether a man. I am going to the Raj Kumar College at Ajmir that I may learn about the world. But you shall see how it is wise. The world looks very big since I have been ill. Kate, how big is the world which you have seen across the Black Water? Where is Tarvin Sahib? I have wished to see him too. Is Tarvin Sahib angry with me or with you?"

He plied her with a hundred questions till they halted before one of the gates in the flank of the palace that led to his mother's wing.

The woman of the desert rose from the ground beside it, and held out her arms.

"I heard the message come," she said to Kate, "and I knew what was required. Give me the child to carry in. Nay, my Prince; there is no cause for fear. I am of good blood."

"Women of good blood walk veiled, and do not speak in the streets," said the child, doubtfully.

"One law for thee and thine, and another for me and mine," the woman answered, with a laugh. "We who earn our bread by toil cannot go veiled, but our fathers lived before us for many hundred years, even as did thine, heaven-born. Come then, the white fairy cannot carry thee so tenderly as I can."

She put her arms about him, and held him to her breast as easily as though he had been a three-year-old child. He leaned back luxuriously, and waved a wasted hand; the grim gate grated on its hinges as it swung back, and they entered together, the woman, the child, and the girl.

There was no lavish display of ornament in that part of the palace. The gaudy tile-work on the walls had flaked and crumbled away in many places, the shutters lacked paint and hung awry, and there were litter and refuse in the courtyard behind the gates. A queen who has lost the king's favor loses as well much else in material comforts.

A door opened, and a voice called. The three plunged into half darkness, and traversed a long, upward-sloping passage, floored with shining white stucco as smooth as marble, which communicated with the Queen's apartments. The Maharaj Kunwar's mother lived by preference in one long, low room that faced to the northeast, that she might press her face against the marble tracery and dream of her home across the sands, eight hundred miles away, among the Kulu hills. The hum of the crowded palace could not be heard there, and the footsteps of her few waiting-women alone broke the silence.

The woman of the desert, with the Prince hugged more closely to her breast, moved through the labyrinth of empty rooms, narrow staircases, and roofed courtyards with the air of a caged panther. Kate and the Prince were familiar with the dark and the tortuousness, the silence and the sullen mystery. To the one they were part and parcel of the horrors amid which she had elected to move; to the other they were his daily life.

At last the journey ended. Kate lifted a heavy curtain as the Prince called for his mother, and the Queen, rising from a pile of white cushions by the window, cried passionately:

"Is it well with the child?"

The Prince struggled to the floor from the woman's arms, and the Queen hung sobbing over him, calling him a thousand endearing names, and fondling him from head to foot. The child's reserve melted,—he had striven for a moment to carry himself as a man of the Rajput race; that is to say, as one shocked beyond expression at any public display of emotion,—and he laughed and wept in his mother's arms. The woman of the desert drew her hand across her eyes, muttering to herself, and Kate turned to look out of the window.

"How shall I give you thanks?" said the Queen at last. "O my son—my little son—child of my heart, the gods and she have made thee well again! But who is that yonder?"

Her eyes fell for the first time on the woman of the desert, who stood by the doorway draped in dull red.

"She carried me here from the carriage," said the Prince, "saying that she was a Rajput of good blood."

"I am of Chohan blood—a Rajput and a mother of Rajputs," said the woman, simply, still standing. "The white fairy worked a miracle upon my man. He was sick in the head and did not know me. It is true that he died, but before the passing of the breath he knew me and called me by my name."

"And *she* carried thee!" said the Queen, with a shiver, drawing the Prince closer to her, for, like all Indian women, she counted the touch and glance of a widow things of evil omen.

The woman fell at the Queen's feet. "Forgive me, forgive me!" she cried. "I had borne three little ones, and the gods took them all, and my man at the last. It was good—it was so good—to hold a child in my arms again. Thou canst forgive," she wailed, "thou art so rich in thy son, and I am only a widow."

"And I a widow in life," said the Queen under her breath. "Of a truth, I should forgive. Rise thou."

The woman still lay where she had fallen, clutching at the Queen's naked feet.

"Rise, then, my sister," the Queen whispered.

"We of the fields," murmured the woman of the desert—"we do not know how to speak to the great people. If my words are rough, does the Queen forgive me?"

"Indeed, I forgive. Thy speech is softer than that of the hill-women of Kulu, but some of the words are new."

"I am of the desert, a herder of camels, a milker of goats. What should I know of the speech of courts? Let the white fairy speak for me."

Kate listened with an alien ear. Now that she had discharged her duty, her freed mind went back to Tarvin's danger, and the shame and overthrow of an hour ago. She saw the

women in her hospital slipping away one by one, her work unraveled, and all hope of good brought to wreck; and she saw Tarvin dying atrocious deaths, and, as she felt, by her hand.

"What is it?" she asked wearily, as the woman plucked at her skirt. Then to the Queen, "This is a woman who alone of all those whom I tried to benefit remained at my side to-day, Queen."

"There has been a talk in the palace," said the Queen, her arm round the Prince's neck—"a talk that trouble had come to your hospital, Sahiba."

"There is no hospital now," Kate answered grimly.

"You promised to take me there, Kate, some day," the Prince said in English.

"The women were fools," said the woman of the desert, quietly, from her place on the ground. "A mad priest told them a lie, that there was a charm among the drugs—"

"Deliver us from all evil spirits and exorcisms," the Queen murmured.

"A charm among her drugs that she handles with her own hands, and so forsooth, Sahiba, they must run out shrieking that their children will be misborn apes and their chicken-souls given to the devils. *Aho!* They will know in a week—not one or two of them, but many—whither their souls go: for they will die, the corn and the corn in the ear together."

Kate shivered. She knew too well that the woman spoke the truth.

"But the drugs!" began the Queen. "Who knows what powers there may be in the drugs?" She laughed nervously, glancing at Kate.

"*Dekho!* Look at her," said the woman, with quiet scorn. "She is a girl and naught else. What could she do to the Gates of Life?"

"She has made my son whole; therefore she is my sister," said the Queen.

"She caused my man to speak to me before the death hour; therefore I am her servant as well as thine, Sahiba," said the other.

The Prince looked up into his mother's face curiously. "She calls thee 'thou,'" he said, as though the woman did not exist. "That is not seemly between a villager and a queen—thee and thou!"

"We be both women, little son. Stay still in my arms. Oh, it is good to feel thee here again, worthless one."

"The heaven-born looks as frail as dried maize," said the woman, quickly.

"A dried monkey, rather," returned the Queen, dropping her lips on the child's head. Both mothers spoke aloud and with emphasis, that the gods, jealous of human happiness, might hear and take for truth the disparagement that veils deepest love.

"*Aho!* my little monkey is dead," said the

Prince, moving restlessly. "I need another one. Let me go into the palace and find another monkey."

"He must not wander into the palace from this chamber," said the Queen, passionately, turning to Kate. "Thou art all too weak, beloved. O Miss Sahib, he must not go!" She knew by experience that it was fruitless to cross her son's will.

"It is my order," said the Prince, without turning his head. "I will go."

"Stay with us, beloved," said Kate. She was wondering whether the hospital could be dragged together again, after three months, and whether it was possible she might have overrated the danger to Nick.

"I go," said the Prince, breaking from his mother's arms. "I am tired of this talk."

"Does the Queen give leave?" asked the woman of the desert under her breath. The Queen nodded, and the Prince found himself caught between two brown arms, against whose strength it was impossible to struggle.

"Let me go, *widow!*" he shouted furiously.

"It is not good for a Rajput to make light of a mother of Rajputs, my King," was the unmoved answer. "If the young steer does not obey the cow, he learns obedience from the yoke. The heaven-born is not strong. He will fall among those passages and stairs. He will stay here. When the rage has left his body he will be weaker than before. Even now"—the large, bright eyes bent themselves on the face of the child—"even now," the calm voice continued, "the rage is going. One moment more, heaven-born, and thou wilt be a prince no longer, but only a little, little child, such as I have borne. *Ahi!* such as I shall never bear again."

With the last words the Prince's head nodded forward on her shoulder. The gust of passion had spent itself, leaving him, as she had foreseen, weak to sleep.

"Shame! oh, shame!" he muttered thickly. "Indeed, I do not wish to go. Let me sleep."

She began to pat him on the shoulder, till the Queen put forward hungry arms, and took back her own again, and, laying the child on a cushion at her side, she spread the skirt of her long muslin robe over him, and looked long at her treasure. The woman crouched down on the floor. Kate sat on a cushion, and listened to the ticking of the cheap American clock in a niche in the wall. The voice of a woman singing a song came muffled and faint through many walls. The dry wind of noon sighed through the fretted screens of the window, and she could hear the horses of the escort swishing their tails and champing their bits in the courtyard a hundred feet below. She listened, thinking ever of Tarvin in growing terror. The Queen

leaned over her son more closely, her eyes humid with mother-love.

"He is asleep," she said at last. "What was the talk about his monkey, Miss Sahib?"

"It died," Kate said, and spurred herself to the lie. "I think it had eaten bad fruit in the garden."

"In the garden?" said the Queen, quickly.

"Yes; in the garden."

The woman of the desert turned her eyes from one woman to the other. These were matters too high for her, and she began timidly to rub the Queen's feet.

"Monkeys often do," she observed. "I have seen as it were a pestilence among the monkey-folk over there at Banswara."

"In what fashion did it die?" insisted the Queen.

"I—I do not know," Kate stammered, and there was another long silence as the hot afternoon wore on.

"Miss Kate, what do you think about my son?" whispered the Queen. "Is he well, or is he not well?"

"He is not very well. In time he will grow stronger, but it would be better if he could go away for a while."

The Queen bowed her head quietly. "I have thought of that also many times sitting here alone; and it was the tearing out of my own heart from my breast. Yes; it would be well if he were to go away. But"—she stretched out her hands despairingly toward the sunshine—"what do I know of the world where he will go, and how can I be sure that he will be safe? Here, even here—" She checked herself suddenly. "Since you have come, Miss Kate, my heart has known a little comfort; but I do not know when you will go away again."

"I cannot guard the child against every evil," Kate replied, covering her face with her hands; "but send him away from this place as swiftly as may be. In God's name, let him go away!"

"*Such hai! Such hai!* It is the truth, the truth!" The Queen turned from Kate to the woman at her feet.

"Thou hast borne three?" she said.

"Yea, three, and one other that never drew breath. They were all men-children," said the woman of the desert.

"And the gods took them?"

"Of smallpox one, and fever the two others."

"Art thou certain that it was the gods?"

"I was with them always till the end."

"Thy man, then, was all thine own?"

"We were only two, he and I. Among our villages the men are poor, and one wife suffices."

"They are rich among the villages. Listen now. If a co-wife had sought the lives of those three of thine—"

"I would have killed her. What else?" The woman's nostrils dilated, and her hand went swiftly to her bosom.

"And if in place of three there had been one only, the delight of thy eyes, and thou hadst known that thou wouldst never bear another, and the co-wife working in darkness had sought for that life? What then?"

"I would have slain her, but with no easy death. At her man's side and in his arms I would have slain her. If she died before my vengeance arrived I would seek for her in hell."

"Thou canst go out into the sunshine and walk in the streets and no man turns his head," said the Queen, bitterly. "Thy hands are free, and thy face is uncovered. What if thou wert a slave among slaves, a stranger among stranger people, and" — the voice dropped — "dispossessed of the favor of thy lord?"

The woman, stooping, kissed the pale feet under her hands.

"Then I would not wear myself with strife, but, remembering that a man-child may grow into a king, would send that child away beyond the power of the co-wife."

"Is it so easy to cut away the hand?" said the Queen, sobbing.

"Better the hand than the heart, Sahiba. Who could guard such a child in this place?"

The Queen pointed to Kate. "She came from far off, and she has once already brought him back from death."

"Her drugs are good, and her skill is great, but — thou knowest she is only a maiden, who has known neither gain nor loss. It may be that I am luckless, and that my eyes are evil — thus did not my man say last autumn — but it may be. Yet I know the pain at the breast and the yearning over the child new-born — as thou hast known it."

"As I have known it."

"My house is empty, and I am a widow and childless, and never again shall a man call me to wed."

"As I am — as I am."

"Nay; the little one is left, whatever else may go, and the little one must be well guarded. If there is any jealousy against the child it were not well to keep him in this hotbed. Let him go out."

"But whither? Miss Kate, dost thou know? The world is all dark to us who sit behind the curtain."

"I know that the child of his own motion desires to go to the princes' school in Ajmir. He has told me that much," said Kate, who had lost no word of the conversation from her place on the cushion, bowed forward with her chin supported in her hands. "It will be only for a year or two."

The Queen laughed a little through her tears. "Only a year or two, Miss Kate. Dost thou know how long is one night when he is not here?"

"And he can return at call; but no cry will bring back mine own. Only a year or two. The world is dark also to those who do not sit behind the curtain, Sahiba. It is no fault of hers. How should she know?" said the woman of the desert under her breath to the Queen.

Against her will, Kate began to feel annoyed at this persistent exclusion of herself from the talk, and the assumption that she, with her own great trouble upon her, whose work was pre-eminently to deal with sorrow, must have no place in this double grief.

"How should I *not* know?" said Kate, impatiently. "Do I not know pain? Is it not my life?"

"Not yet," said the Queen, quietly — "neither pain nor joy. Miss Kate, thou art very wise, and I am only a woman who has never stirred beyond the palace walls. But I am wiser than thou, for I know that which thou dost not know, though thou hast given back my son to me, and to this woman her husband's speech. How shall I repay thee all I owe?"

"Let her hear truth," said the woman under her breath. "We be all three women here, Sahiba — dead leaf, flowering tree, and the blossom unopened."

The Queen caught Kate's hands and gently pulled her forward till her head fell on the Queen's knees. Wearied with the emotions of the morning, unutterably tired in body and spirit, the girl had no desire to lift it. The small hands put her hair back from her forehead, and the full, dark eyes, worn with much weeping, looked into her own. The woman of the desert flung an arm round her waist.

"Listen, my sister," began the Queen, with an infinite tenderness. "There is a proverb among my own people, in the mountains of the north, that a rat found a piece of turmeric, and opened a druggist's shop. Even so with the pain that thou dost know and heal, beloved. Thou art not angry? Nay; thou must not take offense. Forget that thou art white, and I black, and remember only that we three be sisters. Little sister, with us women 't is thus, and no other way. From all except such as have borne a child the world is hid. I make my prayers trembling to such and such a god, whom thou sayest is black stone, and I tremble at the gusts of the night because I believe that the devils ride by my windows at such hours; and I sit here in the dark knitting wool and preparing sweetmeats that come back untasted from my lord's table. And thou, coming

from ten thousand leagues away, very wise and fearing nothing, hast taught me, oh, ten thousand things. Yet thou art the child, and I am still the mother, and what I know thou canst not know, and the wells of my happiness thou canst not fathom, nor the bitter waters of my sorrow, till thou hast tasted sorrow and grief alike. I have told thee of the child—all and more than all, thou sayest? Little sister, I have told thee less than the beginning of my love for him, because I knew that thou couldst not understand. I have told thee my sorrows—all and more than all, thou sayest, when I laid my head against thy breast? How could I tell thee all? Thou art a maiden, and the heart in thy bosom, beneath my heart, betrayed in its very beat that it did not understand. Nay; that woman there, coming from without, knows more of me than thee. And they taught thee in a school, thou hast told me, all manner of healing, and there is no disease in life that thou dost not understand? Little sister, how couldst thou understand life that hast never given it? Hast thou ever felt the tug of the child at the breast? Nay; what need to blush? Hast thou? I know thou hast not. Though I heard thy speech for the first time, and, looking from the window, saw thee walking, I should know. And the others—my sisters in the world—know also. But they do not all speak to thee as I do. When the life quickens under the breast, they, waking in the night, hear all the earth walking to that measure. Why should they tell thee? To-day the hospital has broken from under thee. Is it not so? And the women went out one by one? And what didst thou say to them?"

The woman of the desert, answering for her, spoke. "She said, 'Come back, and I will make ye well.'"

"And by what oath did she affirm her words?"

"There was no oath," said the woman of the desert; "she stood in the gate and called."

"And upon what should a maiden call to bring wavering women back again? The toil that she has borne for their sake? They cannot see it. But of the pains that a woman has shared with them a woman knows. There was no child in thy arms. The mother-look was

not in thy eyes. By what magic, then, wouldst thou speak to women? There was a charm among the drugs, they said, and their children would be misshapen. What didst thou know of the springs of life and death to teach them otherwise? It is written in the books of thy school, I know, that such things cannot be; but we women do not read books. It is not from them that we learn of life. How should such a one prevail, unless the gods help her—and the gods are very far away. Thou hast given thy life to the helping of women. Little sister, when wilt thou also be a woman?"

The voice ceased. Kate's head was buried deep in the Queen's lap. She let it lie there without stirring.

"Aye," said the woman of the desert. "The mark of coverture has been taken from my head, my glass bangles are broken on my arm, and I am unlucky to meet when a man sets forth on a journey. Till I die I must be alone, earning my bread alone, and thinking of the dead. But though I knew that it was to come again, at the end of one year instead of ten, I would still thank the gods that have given me love and a child. Will the Miss Sahib take this in payment for all she did for my man? 'A wandering priest, a childless woman, and a stone in the water are of one blood.' So says the talk of our people. What will the Miss Sahib do now? The Queen has spoken the truth. The gods and thy own wisdom, which is past the wisdom of a maid, have helped thee so far, as I, who was with thee always, have seen. The gods have warned thee that their help is at an end. What remains? Is this work for such as thee? Is it not as the Queen says? She, sitting here alone, and seeing nothing, has seen that which I, moving with thee among the sick day by day, have seen and known. Little sister, is it not so?"

Kate lifted her head slowly from the Queen's knee, and rose.

"Take the child, and let us go," she said hoarsely.

The merciful darkness of the room hid her face.

"Nay," said the Queen; "this woman shall take him. Go thou back alone."

Kate vanished.

(To be concluded in the next number.)

## CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

xv.

met by agreement at Vincent's a week later. When I came in St. Clair was talking of my story.

"The possibilities of the ghost-tales are pretty well worked out," he said, "but Owen's was really fresh."

"The logical character of the old Scot in your story was past praise," said Clayborne.

"And what about the arrears?" remarked Vincent. "I should like to be employed to bring suit for them."

"Oh, I then and there made him write the bill against Mr. Gillespie's ghost. The old banker was delighted when I told him the story; he admitted the obligation, dead or alive, he said, and he was as good as his word."

"That ends it neatly," said Mrs. Vincent. "And now we must really have the character doctor."

I went on to read it, saying:

"The friend who gave me, at my desire, the notes of a part of a rather odd life is now abroad. I have woven what I knew of him into his own account of himself, and have tried to preserve the peculiar abruptness of his style."

### THE CHARACTER DOCTOR.

At the age of twenty-three I was an orphan. I was independent as to means, and by profession a doctor of medicine. I began to practise in L——, and, as I obtained only by slow degrees the patients I needed rather than wanted, I found increasing difficulties. If a case were painful, I suffered too. If it ended ill, I was tormented by self-reproaches. In a word, I was too sensitive to be of use. Weak or hysterical women liked me and my too ready show of sympathy. It was, in fact, real, and quite too real for my good or my comfort. Moreover, I hated to be told that I had so much sympathy. It is a quality to use with wisdom. I could not control it. It was valuable to some patients; it was useless to many, or even did harm. It made me anxious when my mind told me there was no need to be anxious. I was, in fact, too intensely troubled at times over a child or a young mother to be efficient. Decided or pain-giving treatment I shrank from using. I was

inclined to gloomy prognostications, and this weakened my capacity to do good. And yet I was a conscientious man, and eager to do what was right. I have, however, observed that sanguine men, or men who deliberately and constantly predict relief or cure, do best. If failure comes, it explains itself or may be explained. I knew once a foxy old country doctor, who said to me, "Hide your indecisions; tell folks they will get well; tell their friends your doubts afterward." This may be one way of practising a profession; it was not mine.

A few years of practice wore me out, and yet I liked it in a way, and best of all the infinite varieties of life and character laid open to one's view. At last I consulted Professor N——. "And you feel," he said, "more and more the troubles and pain of your patients? To feel too sharply is not rare, and not bad for the young. Sympathy should harden by repeated blows into the tempered steel of usefulness, which has values in proportion to what it has borne; otherwise it and you are useless. Get out of our profession." And I did. I accepted the chair of psychology at B—— University, and plunged with joy into mere study. I soon found a want: The study of man in books and through self-observation became wearisome. The study of myself in the mirror of myself made me morbid. I might have known it would. There may be some who can do this. Autopsychological study seemed to me profitless. Can a man see his own eyes move in a mirror? Also the single man is useless as a field of examination. You recall my lecture on "Genera and Species of Mind," and on "Varieties of the Same." After all, it appeared to me that what I wanted was to collect notes of characters, good, bad, and neutral, if there be such; to study motives, large and small, and to collate them with the history of men intellectually regarded, and to see, also, how the moral nature modifies the mental product, and the reverse. Out of all this I must get some good for others. This my nature made imperative. I obtained a long holiday, which it was supposed I would spend in Germany with Herr Valzenberg, whose study of the diameters of the nerve-cells in relation to criminal tendencies has attracted so much notice.

Nothing was further from my intention. I left B—— in February, 1863, and a week later had an office in quiet West street in the city of

Baypoint. I put on my door "Sylvian West, Character Doctor." You will see that I changed my name. For this I had good reasons. I meant to be another man for the time. I believed that change of name would mentally assist me to this, and I had no desire to be called insane because I chose to strike out a novel method of study, with which I meant to combine immediate utility.

During my office-hours I sat for a while near my window to observe the effect of my business-sign. It was a rather pleasant study. The street was a quiet byway, but morning and evening many people of all classes passed through it. Most of them went by with a passing glance of amusement or vague curiosity; others paused in wonder, went on, looked back, and again went on. Some crossed the street to make sure they had rightly read my sign.

On the fourth day a young man crossed the street, rang the bell, and was shown into my office. I recognized the type at once. He was very sprucely dressed, was not over-clean as to his hands, and in his side-pocket I saw the top of a note-book. He sat down as I rose from my seat at the window.

"Dr. West?" he said.

"Yes. You are a reporter?"

"I am. How did you guess that?"

"It is simple. A note-book and pencil, soiled fingers, and, also—"

"Now that's rather smart," he broke in. "And what else?"

"Nothing."

"Well, you're right anyway. I'm the social reporter for the 'Standard.'"

"A collector of garbage to manure with fools' vanities the devil's farms," I said. "You may not be bad yourself, but you are part of a bad system. I do not want you." On this his look of alert smartness suddenly faded.

He did not lose his temper, but replied in a tone of some thoughtfulness:

"A man must make a living."

"I wish," I said, "there was such a phrase as make a dying. That's what you are making. Go your way; mine is an honest business."

"But the public are interested. The thing is unusual. I should like to ask you a few questions."

"As man to man let me ask you one. Are you never ashamed of yourself?"

He flushed a little. "Well, sometimes. I hate it."

"Then go and sin no more," I said, rising. "Good morning." At this he too rose, replaced the note-book he had drawn from his pocket, and, urging me no further, went out with a simple "Good morning." He must be young at the business, I reflected, and perhaps I may have done him good. I was undeceived two days later when I read in the "Standard":

GREAT SENSATION ON WEST STREET.

Crowds assembled about a curious sign:

DR. SYLVIAN WEST,

CHARACTER DOCTOR.

Our reporter was courteously received by Dr. West, who said he was glad in the interest of the public to answer any questions. The interview was as follows:

"Yes; I am a character doctor. My business is to furnish characters to those who need them. Also I attend to sick characters. Sometimes whole families consult me as to the amendment and reconstruction of conflicting characters. Yes; I expect to have a character hospital, with wards for jealousy, anger, folly."

Then came details of my life. How I was born in Kamchatka, etc. I let the paper fall in dismay. It was the dull season, and there was much more of it. The man's trade-habit had been too much for him. I had more of them, but I gave up advising, and simply said that I would not answer. Then they interviewed my maid, and, at last, the cook at the back gate. It was almost as bad as the case of my friend who found a reporter under his table just before a dinner he was to give to a stranger of high position. I made a note upon the influence of business upon character. In a few days the plague abated.

Very soon my harvest began. At first I had an influx of Biddies, who each wanted a character. It seemed hard to make the public comprehend my purpose.

One afternoon about five I was told that some one wished to see me, and, leaving the up-stairs room I reserved for my books, went down to the office. On the lounge lay a man about twenty, of a death-like pallor. He sprang up as I came in, staggered, and fell back. I saw that he was ill, and called to the maid to bring wine, which he took eagerly. I said, "When did you last eat?"

"At seven to-day."

Upon this I went out and came back with food. "Eat," I said. By and by he rose, saying: "I thank you. I came to see you—for—but now I must tell you all. I left the penitentiary to-day. I got a year for stealing from my employer. A woman was the cause. Ah, three months would have done. When I got out I walked and walked; I thought I could walk forever, and at the corners the wind was in my face, sir. It was like heaven. Of a sudden I grew weak, and, seeing your sign, I came in. Now you know all. I fancy you'll think I certainly do need a character."

"Yes. Where are you going?"

"To B——, in Indiana. I have my good-service money. I will go to L——, and then

walk. I am an Englishman. I have no friends here. I was once in B—— a little while."

"Now for my advice. You cannot walk. Here, this will take you to B——. You will get on, I think. Pay me some day. Be tender to the wrong-doer in days to come, and marry early—a good woman, not a fool; mind that. Solomon's experience was large, and, as you may remember, he gave pretty much the same advice."

He looked at me, at the money, and began to cry.

"Don't," I said. "I never could stand that," and went out of the room. In a few minutes he was gone. I ought to add that he did greatly prosper, and is to-day an esteemed citizen with many happy children.

About a week later a lad of seventeen called on me. He was well dressed and well bred. As he faced me I saw that he looked troubled, and that he hesitated.

"Well," I said.

"You are a character doctor?"

"Yes. What can I do for you?"

"I do not know. I don't know why I came here at all. Do I look like a bad fellow?" And he regarded me with eyes of honest calmness.

"No; you are not bad."

"Maybe I'm a fool. I saw in the paper that you could tell if a man was bad, and why he was bad."

"Oh, hang the papers! What is it?"

"Do you think, sir, a fellow could steal and not know he did it?"

"Yes. Suppose you tell me your story."

Always people have been too ready to confess things to me; it was one of the many torments of my life as a doctor.

"Well, suppose a fellow had the key of a safe in charge, and something was missing. Could any one have taken it but him?"

I replied: "You are only half trusting me. Were I you I would be quite frank, or say nothing—at least to me."

There was a certain sweetness in the young man's face as he looked up at me and said, "Well, I know about doctors; they are like priests—but—"

"I am a physician."

"Must I tell you my name?"

"No; merely what happened."

"Well, father went out of town a month ago, and left with me the key of the safe in his library—in our own house, you know. I did not want it, but my elder brother is ill in bed, and there was no one else. The day father left he showed me where all the papers were, in case he wired for any of them, and also showed me a necklace of emeralds my aunt—my aunt,—oh, I came awfully near telling her name,

—my aunt left in his care, because she's in Europe. That safe kept me anxious. Yes, sir; it seems silly, but my mind was on it, and I am just nearly through college, and I never have had any cares. Of course it wore off by degrees, and then father came back. Indeed, sir, he was worse troubled than I, but I think I have been nearly crazy. I mean the necklace was gone. Why, I heard mother tell father I was very young and he must forgive me; but she sits in her room and rocks and rocks, and takes valerian. And now there is a detective, and he searches the house, and the servants look at me as if I were a thief, and that scoundrel he talked to me yesterday and guessed I'd best own up."

"And is that all?"

"No, sir; I—they all try not to think I did it, and they believe I did. I think I must have done it. I was wondering when it was. If I only knew what I did with it! Every one thinks I took it. But where is it? How can I confess it? I am not sure."

At this he rose and moved about, looked out of the window, and suddenly came back, saying, "By George! there's that detective."

"Sit down," I said. "You need not tell me you have been a good lad or worked at school."

"I'm in the honor list, and I'm captain of the eleven," he said, with sorrowful pride, "and to think—but I did it. It's so."

"Hush!" I returned. "The man who slanders himself is wicked or weak. You are only weak, and only that just now. You never did this act. I say so. If a dozen people say to a man daily, 'You are going to be ill,' that at last affects the most wholesome. If all you love tell you in words, looks, and ways that you have been a thief, at last a man doubts the evidence of his own memory and conscience, and loses his mental equilibrium, and joins the majority against himself. Then he is on the verge of becoming insane. Now, really, are all your people of one opinion?"

"No; my sister Helen she just laughs at the whole thing. I mean when she don't cry."

"Sister Helen has some sense, I should say. And now listen. Go and play cricket to-day. Settle down to your work; you have neglected it. Mind, these are prescriptions. It will come right. I know you for an honest gentleman; now hurry out of the door and detect your detective. Tell him you have told me all, and come back to-morrow. And your name, please?"

He hesitated, and said, "Frederick Winslow."

"And mind, make a good score at cricket, and leave it all to me."

"Thank you," he said. "I must try, sir. I—what is your charge?"

"Let that rest now. When you go the detective will visit me. It is our turn now."

A minute later, as I expected, the detective walked in. "Mr. Winslow," he said, "says he has told you all. I am Mr. Diggles. Here's my card." It bore a large eye in the center, and over it, "John Diggles, Confidential Detective Agency."

"Glad he owned up. Pretty smart boy, but they gets worried into lettin' out at last." All this rather volubly.

"Sit down," I said. "You believe that young fellow stole an emerald necklace?"

"Why, who else could have done it?"

"There is a reason for crime, usually?"

"Yes; I guess there 's always reason for wanting other folks' things. But he has told you he took it?"

"No; and if he had, in the state he is in now, I should not have believed him."

"Why? Not believe him! Why not?"

"Because you took it yourself."

At this he sprang to his feet and exclaimed, "I did not come here to be insulted."

I was about to explain that the probability of his being the thief was to me not less than of the necklace having been stolen by my young captain of the cricket eleven, but something in the sudden flush and rage of a man living always in familiar nearness to crime gave me reason to hesitate. Crime for these men loses its horror, and becomes a mere enemy to be technically dealt with. It troubles them as little as deceit does the soldier, who plays the game of war. Fraud is his weapon. I returned quickly: "What has been your life compared to this boy's? His has been honest, dutiful, and correct. And yours? What have you been?"

The man was singularly bewildered, and said nothing. I went on: "Who is most likely to be the thief, you or he? You had best go home and say the prayer of a wiser man—'God be merciful to me, a fool.'"

"I want to know what that boy told you."

"That you will never know. Send me that lad's father."

"I won't do it."

"Take care how you act in this case."

"You called me a thief."

"I did."

"Well, then, you look out, that 's all." He was clearly foolish, as well as angry. "You think I stole that necklace. That 's the kind of character doctor you are!"

"I said you were a thief. And now it is a man's character, his honor, you are helping to steal, because you have no sense, and come to a point on any obvious fact."

"Oh, that 's all, is it?"

The Winslows were well-known people, and I readily found Mr. Winslow. He was a slow, pre-

cise, over-accurate man of sixty. No imagination; horizons limited; undergoing in advance physical, moral, and mental ossification. Of course, as a character doctor, I was to him a queer, extra-social animal. I soon found that I must tell him my whole story.

His astonishment was as large as his nature let it be; but as he knew my people, and conceded to the class to which we belonged larger privileges than he would admit for others, I was able to win his confidence.

I then explained to him my conviction as to his son's innocence.

"Oh, of course," he replied, "that is so. But, then, the facts,"—and he began elaborately to describe them, ending with, "Of course it was n't he, but who was it?"

I told him that the boy was being goaded by hints, looks, doubts, half-beliefs, and the detective's folly into a form of mental disorder which would end in the avowal of what he had never done.

He was puzzled and alarmed, but, on careful examination, nothing new came out. On my casually asking for his sick son, he said that he was an invalid unable to walk; had neurasthenia, and now, refusing to see doctors, remained in bed. I was nearly at the end of my resources; I asked if I might see him, for, after our talk, I had so won my way that I was allowed to examine the safe, and to talk with the mother and daughter.

Mr. Winslow said: "Miss Winslow will take you up. He dislikes me to come in. He says my boots creak. He says some people's boots always creak."

Miss Helen went up with me. I was on her side, as she knew. She said to me: "He may refuse to see you. Why do you want to see him?"

"Because," I said, "we are in the tangle of a mystery, and he too is rather mysterious."

She laughed. "I see." Clearly she had imaginative possibilities, and I like that.

I said, "I will go in alone."

"I would," she returned firmly.

The room was in half light. I said as I went in: "Mr. Winslow, I am a physician. Your father desires me to see you. My name is West. Let me open the windows."

"Oh, if I must, I must," he said peevishly.

The flood of light showed me a thin, apathetic man of thirty. I sat down.

"Open your eyes." He obeyed. Then I went carefully into his case, and at the close he said:

"No, I can't walk or read; but I was better until this necklace business. Every one bothers about it. Aunt L—— says it is for my wife; and so I say, it is mine, and if I don't care, who else need care?"

As I rose to go he said: "My legs hurt me. Now you are here, just look at them."

I did so. There were on each leg bruises in the same place, below the knees. Hesitating, I went on to look at the feet. Then I said: "That will do. What fire do you burn? Oh, soft coal, I see. I will think it over, and see you again." Down-stairs I found Mr. Winslow.

"Well?" he exclaimed.

"Your son says he cannot walk. On his soles are marks of the black from the fire. On his legs are two bruises; one has a slight break of the skin. Either he is untruthful, or he walks in his sleep."

"He did as a boy."

The result was that I had a watch set on the invalid. After three nights he rose, lighted his candle, walked into his brother's room, and with curious care searched his clothes' pockets. At last he took a bundle of keys from one of them, and went quietly down-stairs to the safe. He was quite unconscious of being watched, and foolishly but deliberately tried key after key, small or large, and at last went back to his bed, dropping the keys on the way.

When I was told of all this, I was greatly puzzled, and regretted that the key of the safe had not been left where he could get it. Saying that I was still better satisfied of my young friend's innocence, I went away, and before going home called at the steamer agency to engage passage for the coming autumn. As I entered I saw my detective go out of another door. After settling for my berth, I asked if Mr. Diggles was going to Europe. The clerk said, "Who?"

I replied, "The man who just went out."

"Name of Stimpson," said the clerk. "He sails next week."

The next day I sent for the man. He came early.

"Any news?" he said abruptly.

"No; I merely wanted to ask you a question or two."

"All right. Go ahead." He exhibited no hostility.

"When did you search the safe?"

"The third day after Mr. Winslow came home."

"You did it thoroughly?"

"I did. Mr. Winslow he had n't unrolled all the bundles. He said it was no use, they was only deeds and such. I done it thorough."

"And are you not at the end of your resources?"

"No, sir. By this day month we shall have him. He is a boy, and he'll try to sell or pawn it. I've got an eye on him."

"But you sail next week."

The man suddenly tilted back his chair,

and in a certain loosening of his features I saw alarm and astonishment.

"I—yes—business abroad."

"Name of Stimpson?" I urged. As I spoke I rose. "Look here," I said, "to-morrow you will go to the house and ask leave to search that safe. The necklace will be found the day after in a bundle of deeds."

"Are you crazy?"

"No; but you will be, and worse, if that necklace is not found. Now, I know, and you have one day, and no more. Remember, I know. It is this or ruin, and you are watched."

He looked at me a moment and then went out without a word, and did precisely what I had ordered him to do.

"And the necklace?" said Mrs. Vincent.

"Was found in a roll of deeds. My friend goes on to say that his theory was that the sleep-walker took the key, opened the safe, and—who can say why?—removed the necklace from its case, and put it inside a roll of old papers. On the detective's more thorough search at his first inspection, he found it, and easily contrived to pocket it."

"Meanwhile, we were set astray by the elder brother's somnambulism, which, I confess, misled me in part. The rest explains itself."

"The notes of the cases which follow are the last I shall read to you, although there are others as interesting. I find he has classified them under headings."

Case 31 consults me.

X—, æt. 30. Male, good habits, fugitive ambitions, intellect about No. 12 of my scale. Inexorably materialistic tendencies, with longings to see things more spiritually. Want of imagination; general lack of persistent energy; hence constant efforts aborted by incapacity for continued labor, and lack of the bribes offered by imagination. Shifts responsibility on to his ancestral inheritances. A life of self-excuses, but says he is a failure. Advise the tonic of a desperate love-affair with a woman of sense. He says the medicine seems to be wisely ordered, but who is to be the apothecary? Prognosis bad.

"I think I shall call on that doctor," said St. Clair, laughing. "I know an apothecary—what next?"

Case 47.

Mrs. B—, æt. 33. Not a strong nature, but mildly disposed to do good, to attend to life's duties. No tastes, no strong traits; morally anemic. Spoilt as a child; indulged by a husband; petted by fortune. No intense maternal instincts, and relieved of the care of her children. Is bored to the limit of endurance, and is a little pleased with her capacity for ennui; regards it as a distinction. A life without motives, and, as a result, peevish discon-

ment. Her husband asks advice. He is immensely rich. I advise poverty, but he thinks that worse than ennui. There are no moral tonics for these people. You *shall* and you *must* are not in their drug-shops. That is the malaria of excessive wealth.

Case 131. "This will interest you," I said, "in the light of our recent talk. It is the last I shall trouble you with."

L—— at thirty-five marries a woman of fortune and attractions, an only child. By degrees she insists with tears and entreaties on absorbing his life in her own. He cannot leave her a day without difficulty; has by degrees given up his sports, his outdoor pursuits, and at last is driven or decoyed into abandoning his business, which is not a necessity, as she is rich and lavishly generous. Her capacity for attachment is abnormally strong. Her case is one of jealousy carried to the extent of hating a rival in his pursuits or his tastes. She must be his life and adequate. This implies vast belief in herself. Of other women she is not jealous. Under this narrowing of existence he is failing in health of mind and body, and thinks himself a traitor to her. He is dissatisfied with a too merely emotional life. The woman sometimes absorbs the man; the man rarely captures the totality of the woman. Either is unwholesome. He consults me. I predict for him a sad failure unless he consents to declare his independence and is willing to discipline her into happiness. He will be unlikely to take my advice.

At this point Clayborne broke in with a yawn. "Really, my dear North," he said, "how much more of this is there?"

I laughed. "This is by no means all, but I shall not ask you to hear more. There is material for a dozen novels in these notes."

"That is an admirable reason for going no further. I never read novels. I tried to once, but I found that it made me desire to go beyond facts in my own work."

"To go beyond facts?" said St. Clair. "It seems to me that imagination controlled by reason ought to be indispensable to the true historian."

"Oh, your picturesque historian? We know him. Good night, Mrs. Vincent."

With this our evening ended. But as I went out Mrs. Vincent said: "Come in to-morrow; I want you to help a friend of mine. It is and it is not a medical question."

I said I would come, and, turning, noticed a queer smile on the features of Vincent.

## XVI.

"You are good to come so early," said our hostess. "Sit down."

"Is she old or young?"

"I decline to say. You will be amused and puzzled."

This time Mrs. Vincent was mouse-colored, and clad in some stuff of silvery sheen where it caught the light. The flowers were vivid orchids, which looked like embroidered jokes or grotesque floral caricatures.

"I want first," she said, "to talk a little about your character doctor. Is not every true and clever physician more or less what he tries to be?"

"Yes."

"And people confess to you?"

"Ah, too much—too much!"

She was silent a moment, and then said: "I ought to hesitate about putting burdens on one already weighted heavily, but it so chanced that a woman—indeed, women—I esteem need help which you know how to give. And—oh, I meant to explain, but here comes Mrs. Leigh."

As she spoke a large, handsome woman entered. She was known to me by name, and, in fact, was one of my kindred, but so far back as to give me no claim of distinct relationship. Nor had we ever met, because she had been for many years in Europe.

After I had been presented, she and Mrs. Vincent fell into talk, and thus gave me a chance to observe that the newcomer was clearly a woman somewhat peculiar and positive, who had seen much of many societies, and was evidently of a not rare type of the woman of the world.

Presently Mrs. Vincent said: "I promised to talk to Dr. North of your difficulty, but perhaps, as he is here, and you too, it were better you said to him directly what you want."

"I would rather have done so through you, my dear. But, in fact, I am troubled. I distrust my own opinions, and I want to be just to my daughter."

"I am at your service," I said.

"You do not know my daughter Alice? Of course you could not."

"Suppose you state your difficulty."

"Alice is twenty-four— Do tell him, my dear. My opinion is worthless."

"Gladly," said Mrs. Vincent. "Alice is a woman of unusual force of character. As life has gone on she has acquired a strong belief that a woman of fortune and intellect (for she is more than merely intelligent) should have some distinct career. She has seen much of the gay world, and it does not satisfy her cravings. Like *Hamlet*, neither men nor women delight her. And now, coming home to live, she has grown depressed and unhappy. Occupations without definite aims dissatisfy her, and while she performs every duty to her home circle and to society, which she measurably likes, she has a

strong sense that these do not competently fill her life. No one knows better than I what this means. I had once this disease, and pretty badly — the hunger for imperative duties.”

“And you,” I said, much interested — “you were cured?”

“Yes; by marriage. It is what you call a heroic remedy. But not all women marry, and Alice has so far been hard, in fact impossible, to please. She has my sympathy because I once did have ambitions for a distinct career. They are lost now in the perfect gratification which I have in seeing the growth and increasing usefulness of my husband’s life. It contents me fully, but it might not have done so. I pity profoundly the large-minded woman who, craving a like satisfaction, finds too late that the man in whose life she has merged her own is incapable of living up to her ideals.”

“Well,” said Mrs. Leigh, “you are no doubt correct, but Alice is Alice, and no one else, and Frederick Vincents are not common, and —”

“Go on, dear. Best to tell your own story.”

“Oh, Alice says she can endure it no longer, and now she proposes to — really, Anne, it is awful. She wants to study medicine, and, oh, you do not know Alice. She is so determined. At last I promised to inquire about it. It is too distressing. And what can I do? I am like a baby when she talks to me. She is so obstinate, and then I get tired and say, ‘Have it your own way,’ and after that we both cry, and in two or three days it is all to be gone over again, just as I think I am done with it. Marry her! If I only could. And now what do you advise?” said Mrs. Leigh, turning to me.

I was a little puzzled, and hesitated. At last I said: “Tell me first, Mrs. Vincent, what do you think of this matter? It is not to be settled by my own views. I do not know Miss Leigh, and you do.”

“Yes; but I have tried to put you in possession of her peculiarities. Would you say, let her do as she desires, or would you be positive in refusal? She will yield, but she will hate it.”

“Could I see her?” I said.

“Yes; she is dining out, but will be here very soon. She is to call for her mother.”

“If, my dear Anne, she knew that we had been discussing her — she is capable, the dear child, of anything.”

“Even of a love-affair,” said Mrs. Vincent, merrily.

“Of anything else but that. Men are delightful to Alice until they become interested; then, as she says, she becomes disinterested.”

“There is some truth in that,” cried our hostess. “The moment a man is interested he

ceases to be interesting to some women. If the position has in it nothing ridiculous to a woman, then she is either in danger or is a mere coquette.”

“I do not profess to comprehend Alice,” said Mrs. Leigh. “The boys I can manage, and Maude; but once when Alice was very little she said, ‘Mama, was the Centurion a woman?’ Of course I said, ‘No; and why do you ask so silly a question?’ ‘Because he just said, ‘Do this,’ and ‘Go,’ and ‘Do that,’ and never gave any reasons; and that is the way you do.’ Of course I punished her, but that was useless. Once, after I had put her on bread and water for a day, she told me the Bible said that ‘man shall not live by bread alone.’ So I told her she had water too. When I came to let her out that evening, she said, ‘I’m so sorry, mama; I did not think about the water, and I forgot I was a girl; the Bible says a man.’ Now we never argue.”

I caught Mrs. Vincent’s eye for a moment. It was intelligent and telegraphic. I began to feel curious about this reasoning child, and the woman evolved out of such a childhood.

“I can see,” returned our hostess, “how difficult it must have been to manage a being like that, and one too, as I recall Alice, so affectionate and so sensitive.”

“O my dear Anne, sensitive hardly expresses it. My children have been brought up on system, and a part of it has been absolute certainty of punishment. But if I punished Ned, and he needed it pretty often, Alice was in tears for a day, ‘And, would I punish her?’ And one day she was sure that would hurt Ned worse. Well, at last I took her at her word, and then Ned was in a rage, and declared he would kill himself if I ever struck her again.”

“Struck!” said Mrs. Vincent. “But pardon me.”

“Oh, they were mere children. I do not at all share your views about education; and then, dear, you have no experience — none.”

“That is true,” said Mrs. Vincent, quietly.

She was vastly tender about all little ones, as some childless women are. Pausing a moment, she added: “Our only excuse for talking so intimately of my dear Alice is because I want Dr. North to understand the person for whom we seek his advice. Few people are as little likely to misunderstand us as he.”

“Indeed, Anne, if he can see through Alice, he will be very clever.”

“No one,” I returned, “can easily apprehend character from mere description, and you seem to me to have, and to have had, a very complex nature to deal with.”

“No; she is simple,” said Mrs. Vincent, “and, like such people, very direct. Only, — and you

will pardon me, Helen,— Mrs. Leigh and her daughter are people so different that it is not easy for them to agree in opinion. In all lesser matters Alice yields. In larger matters she is at times immovable, and," she added, laughing, "as my dear Mrs. Leigh is also, and always immovable—"

"Oh," cried the mama, interrupting her, "excuse me, dear Anne, but that is because I am systematic, and system can never be cruel, because people know what to expect. I heard Mr. Clayborne say that, and it struck me as very profound."

"Be sure," I replied, not a little amused, "that I shall regard all you say as a confidence. I must know Miss Leigh personally, and better than your talk can make me know her, before I advise you, and even then I may decline to advise, or my advice may be of little use, to her, at least."

"Too true," remarked Mrs. Leigh. "I know her well, and my advice is of very little use."

"I hear the carriage," said Mrs. Vincent. "This very original consultation had better end here. You were at Baden, Helen, were you not?"

"Yes."

"Did you meet the Falconbergs? Vincent is very much attached to them. You know he carried on a suit for the German embassy when Count Falconberg was *Chargé*. Ah, my dear Alice, how late you are! The dinner must have been very pleasant. Where is Edward? My old friend Dr. Owen North, Miss Leigh."

Instantly I knew, as I rose to meet her, that she understood we had been talking of her. I read with ease the language of her face. One has these mysterious cognitions as to certain people, and even the steady discipline of society had as yet failed to enable her to preserve that entire control of the features which makes its life an easy masquerade. The trace of annoyed surprise was gone as she said cordially: "I feel that I ought to know you. We crossed your path in Europe over and over years ago, and I used to hear mama regretting that we had not met."

"It was my loss," I returned.

"And was the dinner pleasant? Do tell us," said Mrs. Vincent.

"Yes and no. Too long. All our dinners here are too long. I exhausted one of my neighbors. He was rather ponderous. I tried him on a variety of subjects, but at last we hit, by good luck, on the stock-exchange. It must be a queer sight, and when we women are stock-brokers in the year 2000—ah, I should like to see what it will be then. I know all about bulls, and bears, and puts, and shorts, and margins, and —"

"Alice!" said Mrs. Leigh, severely.

"And the other man?" said I.

"Ah, he was really a nice boy of twenty. He confided to me his ambitions. Do you not know, Dr. North, the sort of fresh shrewdness a young fellow like that has sometimes? It is delightful, and such a pleasant belief that he knows the world."

"That is like Alice. She is always losing her heart to some boy in his teens," said the mama.

"She ought to know Mr. St. Clair," cried Mrs. Vincent. "He is in his teens, and always will be. And I must be a witch. Indeed, I uttered no spells, but he always comes just at the moment one wants him, unless you expect him at dinner." And so, amidst her laughing remarks, she presented St. Clair to Miss Alice and her astonished mama.

St. Clair was utterly regardless of the conventional in many ways, and especially as to engagements. He might or might not dine with you if he had promised to do so, and these failures, due very often to facility of forgetfulness, were at times quite deliberate, and to appearance selfish, or at least self-full. He would receive a telegram and leave it unopened for a day, and I have seen the drawer of his desk filled with unopened letters.

Now he was in a long, dark-brown velvet jacket, and a spotless, thin white flannel shirt, with a low collar and a disheveled red necktie. As to his hands, they were always perfectly cared for, white, and delicate. The crown of brown, wilful curls over the merry eyes went well with his picturesque disorder of dress, but I could see that Mrs. Leigh set him down at once as a person not of her world. She was as civilly cool as her daughter was the reverse. He stood a moment by Miss Alice in her evening dress, a rosy athlete, blue-eyed, gay, happy, and picturesque, with long Vandyke beard, soft mustache, and an indefinite, careless grace in all his ways. The woman was, as to dress and outside manner, simply and charmingly conventional. I have no art in describing faces. Hers was of a clear white, but the richly tinted lips showed that this was the natural hue of perfect health. As she stood, I saw that this paleness was not constant. Little isles of color came and went, and seemed to me to wander about cheek and neck, as if to visit one lovely feature after another. Yes, she was handsome; that was clear by the way St. Clair tranquilly regarded her. All beauty of form bewildered him into forgetfulness of surroundings.

As he was presented, St. Clair bowed to the matron, shook Mrs. Vincent by both hands, and then, as I said, turned a quiet gaze of delight on the young woman.

"I think we must have met before," he said.

"Indeed," she exclaimed.

"Yes; I am always sure of that about certain people."

"That is one of St. Clair's fads," I said. "But as to your table-companions. I know one of them. His sole pleasure is in stock-gambling."

"Ah," cried Mrs. Vincent, "I can understand that, and, indeed, all gambling propensities."

"Anne! my dear Anne!" said Mrs. Leigh.

"Yes; I should like to gamble if one did not have to lose, which I should hate, or to win, which would be worse."

"And to me it is incomprehensible," said Miss Alice. "I dislike chance."

"What! the dear god Chance?" said St. Clair. "I wish I could shuffle life every morning like a pack of cards."

She looked at him steadily. He was always in earnest. Then she remarked:

"You like all games of chance?"

"Yes; but I never win. I want to think I shall win, but I never want to win."

"And of course you do sometimes?"

"Yes, it is like making love. I think I want to win, but I do not, and I am dreadfully afraid if I come near to winning."

Miss Alice looked amused and puzzled.

"A rare fancy, I should say. And the money—if you do win? Does it not annoy, embarrass?"

"Oh, I give it away. I prefer to give it back to the man; but I tried that once, and found that it was looked upon as an insult. I had to explain, and it was not very easy."

"I should think not," said I. "I once gambled in stocks indirectly, and with a lucky result. A man lost half of his fortune in X. Y. stock. It fell from 40 to 7 in a month. He became depressed and threatened to kill himself. I did what I could, and assured him that the stock was good and would rise again. I was very young, Miss Leigh, and very sanguine. In a month he came back and said he was himself again, and much obliged for my advice."

"What advice?" I said.

"Oh," he cried, 'you told me the stock was good and would rise, and as I knew you were a friend of the president of the road I determined to act upon your confidence, and so I bought at 7 and 9 all the stock I could afford to carry.'

"Without a word I left him, and, returning with the morning paper, said, 'The stock is 37. Promise me to sell at once.' He said, 'Of course.' Then I made him pledge himself never again to meddle with stocks."

"And he kept his word?" said Mrs. Vincent.

"Yes; and made a dreadful amount of money."

"I like your making him promise not to gamble," said Miss Leigh, gravely. "What a droll story!"

Meanwhile Mrs. Vincent and the mother had been chatting apart, and now the latter rose. "Come, Alice," she said; and then, with the utmost cordiality, "And, Dr. North, let us see you soon, very soon, and often. We are of the same blood, you know. Good evening, Mr. St. Clair; I trust we shall have the pleasure of seeing you again."

St. Clair took no note of the difference in manner to him and to me; I do not think he saw it. He was again absorbed in the study of Alice.

"Oh, with great pleasure," he returned. "And Fred is in the study, Mrs. Vincent, you said? I will join him. Good night."

He went up-stairs, while I descended the staircase with Mrs. Vincent's friends. I put them into their carriage, and went back.

"Shall I need to apologize?" said Mrs. Vincent, when we were again seated.

"Indeed, no. What a remarkable girl! And the mother?"

"Oh, better than she seems. There is much sense back of her views as to system in education, and although positive, cruelly tactless, capable, in a word, of incredible social blunders, she is yet a lady, and, moreover, a kindly, charitable woman. People like her. She is handsome still, as you see. But she is not the mama for Alice."

"I did not like her manner to St. Clair," I said.

"The only defense possible for him is to know him. Imagine the effect of that jacket on Mrs. Leigh! It said Bohemia at once."

"And if so, what must be to her social nerves the idea of Miss—Dr. Alice, in fact? Yes; I shrink from it myself," I continued, "and I am not sure that I am wise."

"At least," returned Mrs. Vincent, "it cannot be here a question of right or wrong. There is no wickedness in it. She abandons no duty. The brothers are old enough not to need her. The mother and she do not agree. I mean that they look at life from diverse points of view. Really, they both love and admire each other. Only on large occasions do they approach a quarrel, and Alice is as respectful then as she is determined."

"Not obstinate. Mrs. Leigh is that, I should say."

"Her worst annoyances are what Fred calls Alice's white mice. She has a curious collection of friends, the socially lame, halt, and blind, who adore her, and to pursue a duty is as much a temptation to Alice as a pleasant bit of wickedness is to some other women. You will like her. You are sure to like her."

"I do already."

"I knew you would. And do make St. Clair call. He never will unless you make him."

"I will try. I can at least leave his card."

"Yes; do. Next week, you know, we are all to take tea at his studio. I am to matronize the party. I want Alice to go, and her mother, but I will see to that. Only he *must* call, and then a few words to Mrs. Leigh will settle it. She does what I like, and likes what I do, and is, therefore, a model to all my friends."

"I have no need of the example, but I wish you had not asked me to meddle in this doctor business."

"Why?"

"I hardly know."

"And yet, that is unusual with you. I mean, not to be clear as to your reasons. I am sorry; I—"

"Please don't—I am always at your service—always. I will find a chance to talk to Miss Alice."

"Pray do; but be careful. I want her to like you. You know I insist on my friends liking one another. And now you must go. I am tired. Fred is up-stairs."

"No; I must go home. Good night."

XVII.

I SAW none of these people for some days. The Leighs were not at home when I called, and my life went on its usual course of busy hours. Then I remembered Mrs. Vincent's request, and dropped in on St. Clair at his studio. Asking him casually if he had called on Mrs. Leigh, he said, "No," and to my surprise, "Would I leave his card?" I said, "Yes; with pleasure," and asked him at what hour was his afternoon tea.

"Jove!" he exclaimed, "I forgot it. I will see Mrs. Vincent. How do people remember things? I want to have that splendid young woman; and the mama, I suppose, is a sad necessity. How lucky that you came in."

"Best to see Mrs. Vincent soon."

"I will."

"Now, at once. Change your dress,"—he was in his blouse—"and I will drop you there. And make haste."

I did see him safely into Mrs. Vincent's house, knowing very well that it was as likely as not that he would have forgotten the whole matter had I not reminded him in time. Then I left my carriage and walked to Mrs. Leigh's. As the door opened I met Miss Leigh in the hall, dressed for the street.

"Oh," she said, "you are caught and must come in. I am in no hurry to go out. I am sorry mama is not at home."

"I am at least fortunate," I said, as we

turned back along the hall, "in finding you, and you will please to be a trifle blind while I drop St. Clair's cards on the table. Half a dozen friends are needed to perform for him his social duties. He might call on you daily for a week, and then not for six months."

"One must have to make large allowances for a friend like that," she said, as we entered the drawing-room. "But do you not think that that is a part of the capacity for friendship? I mean knowledge with charity."

"Assuredly. And with all his shortcomings St. Clair is a man to love. What he needs in life is some woman as tender as she is resolute."

"Alas for the woman!"

"No. I presuppose the one essential without which the double life is inconceivable—to me, at least. However, this must be left to fate. Mrs. Vincent will ask your mother and you to his studio next week. We are to see his statues, and to have tea."

"But mama will never go," she returned hastily. "I beg pardon, she is engaged,—I mean there will be some engagement,—and I should like to go. Why do not all of you wear brown velvet coats?"

"And have curly hair, and write verses, and carve statues, and look like young Greek athletes! Ah, Miss Leigh, there are drawbacks—believe me, there are drawbacks. Now a dress-coat would have made this afternoon tea seem so easy and so delightful to a matronly kinswoman of mine."

"You see too much," she cried, laughing. "Yes; so far as mama is concerned, that beautiful, worn velvet jacket was fatal. But perhaps Mrs. Vincent will make mama go. She has a way of smiling mama into or out of anything." Then she paused a little and, coloring, said: "Mama told me last night that she had talked with you and Mrs. Vincent about me. Mama never keeps a secret very long, unless you ask her to tell it, and I was sure that I should hear of it soon or late, for I knew at once the other night that I had been under discussion. Frankly speaking, I did not like it. Now, if you— if you were—were a girl, would you have liked it?"

I watched her with amusement and honest interest.

"Oh, the delightful possibility of being a girl, and of being discussed by you and Mrs. Vincent! I think I could stand it."

"Please do not laugh at me."

"I do not."

"But you do, and I am serious. I am not always to be taken lightly. And men are so apt to insist that a woman must be anything but serious."

"But every sermon has a text. About what are you serious?"

"You know. I—of course mama told me,

and, to be plain, I would rather state my own case, even at the risk of your thinking me a very singular young woman."

"I might answer that to be unusual is not always to be unpleasant."

"That is nicely put and kindly. May I go on?"

"I wish you would. I have heard something of this trouble of yours."

"Oh, it is not my trouble. People—other people—take the rough material of one's views, plans, hopes, and manufacture trouble out of them. But pardon me. I interrupted you. Do you really want me to go on?"

"Pray do." She paused, looked up at me, and then down at her lap, and at last set wide eyes on me for a moment and continued:

"I hesitate because I do not know how much to say. Mrs. Vincent can tell you just what I am, the bad and the good. Oh, I see she has done it already."

"Yes."

"Well, I am twenty-four. I have more than enough means. Also, I have active brains. A certain discontentment with this life of bits and shreds troubles me. I am told that I should amuse myself as others do—with music. I can play, but I have no real talent or love for it. Sketch! I can caricature hatefully well; I loathe it. And at last mama suggests fancy work, and Aunt Selina says, 'The poor, my dear.' If I were free as to the last suggestion, I might find in it a true career, but no young unmarried woman could make of this a life—not mama's daughter, at least. What I need is connected work, something which offers an enlarging life. I do not mean for ambition, but as a definite means of development. You are going to say there is science, study."

"I was," I answered. "You are dreadfully apprehensive as to one's ideas."

"Oh, it was what others have suggested; but mere acquirement of barren knowledge seems to me a poor use to make of life."

"Yes; that is true. I am at one with you there."

"I have thought it all over. I want to study medicine, and practise it too. That is all. You can help me. Be on my side. I—I shall thank you so much. And you will be my friend in this, will you not?" These last sentences were spoken with some excitement, and with a look of earnest anxiety. I knew as she talked that this was not a woman to turn aside from her purposes with ease. And what could I say? I, too, hesitated. She went on again, and now with a pretty girl-like timidity which touched me.

"Perhaps I have said more than I should; I may have asked too much of you. Sometimes I seem to myself to be a strong, effective

woman, needing no help, and competent to go my way. And then I find I have troubled mama, and that hurts me, and then I relent, and am like a weak child groping about for help. Are all women like that? I am stopped here, and turned aside there, and told to consult this one or that. It seems so hard to do what is right."

"No one knows that better than I do," I replied. "It is not enough to want to do right. And now, as regards your mother, I am not at all sure what to do or say. Like you, I want to do right, and do not find it easy."

I felt that I did not wish to wound this gentle girl, with her honest longings, and her despair as to the meagerness of mere upper-class life—its failures to satisfy the large mind and larger heart. After an awkward pause I said, "I should like to help you, and I desire in so doing not to hurt you"; and, having so spoken, felt like a fool.

"But you must not mind that. It is not—not as if you had known me for years. Speak as you would to a stranger, a patient."

"You have made it difficult."

"I? How?"

"No matter. I will do as you say. But remember, I may be wrong, may have prejudices."

"Pray, go on."

"I think that every human being, man or woman, is entitled to any career he or she may please to desire. This is a mere human right."

"Oh, thank you."

"Wait a little. Whether the public will use the person or not, is the business of the public. Should you ask if personally I believe that women make as good doctors as men of like education, I say no. Should you ask me if I think it desirable that in the interests of society in general women should follow the same careers as men, I say no."

"And why?"

"That is a serious question, or rather several questions, some of them not easily to be answered. I would rather not discuss them."

"And is this all?"

"No; and you will smile at my sequel. I never saw a woman who did not lose something womanly in acquiring the education of the physician. I hardly put it delicately enough: a charm is lost."

"Oh, but that is of no moment."

"You cannot think that. You would lose the power to know you had lost something. That is the real evil. Others would know it. Men, at least."

"Do you think this really important?"

"Yes, I do."

"Oh, there is mama, and I have not half done."

"Perhaps it is as well, Miss Leigh. You

should ask some one who is not a doctor. Every profession has its prejudices, and I am constantly in fear of mine. But, in fact, as to these, the best of us are like people with cross pet dogs; we may be puzzled to know what to do with them, but we do not knock them on the head."

"Oh, but how a nice frank statement like that comforts one. You will not forget that I have as yet said no word in reply?"

"No. I shall want to hear—I shall very much want to hear."

As I spoke, Mrs. Leigh entered, large, rosy, handsome, and smiling. She was a little blown from the exertion of mounting the stairs.

"Good morning, Dr. North. I am glad to see you—very glad."

"Let me take your cloak, mama," said Miss Alice, as I returned the mother's welcome and added that I was on the wing, and had more than used up my time. Mrs. Leigh was profusely sorry, but rang the bell, and I left them.

For some good or bad reason the servant was not in the hall, and as I went down I was aware that I had left my hat in the drawing-room. As I went up again to reclaim it, I heard Mrs. Leigh's voice in quick, decisive, and rather high tones. I was seized at once with a violent attack of what I may call the cough social. The voice fell a little, and I went in, saying, "I was careless enough to leave my hat, and rash enough to come back after it."

"I am glad you have come back," said Mrs. Leigh. "Do give me five minutes; I have been talking to my daughter."

"I beg of you, mama—Dr. North has an engagement; please not to—"

"It is perfectly useless, Alice. Every one is talking about it. Mrs. Flint asked me if you were going to be a homeopath or a regular."

"Mama!"

"And old Mr. Ashton asked me if he might send for you when he had the gout, and that fool, his son, talked about 'sweet girl graduates.'"

I had to choose swiftly between retreat or a declaration in favor of the mother or the daughter, who stood white and still before us, her hands clasped together in front of her.

"Pardon me," I interposed. "I have really out a moment; and again a pardon, if I say that this is not the best way to meet this question. You have flattered me by asking me to share your counsels. I must have time to think about it. Miss Leigh has been most frank with me, and, my dear Mrs. Leigh, speaking for myself, were I Miss Leigh, nothing would harden me like the ridicule of such women as Mrs. Flint. She is smart—that is the word—and malicious, and so confident that she confuses people who do not know her combination of humor and inexactness."

"I did not quite understand her," said Mrs. Leigh. "Do you think she could have meant to make fun of Alice, of us, of me?"

"Oh, I knew of course you would see through her. I hope when Miss Leigh attends that hoary sinner Ashton, she will give him some good old-fashioned dose. May I beg to be called in consultation?"

Miss Leigh smiled. Her hands unlocked: "Thank you," she said. "And do let this matter rest, mama."

"Oh, of course. I wish other people would; but I could not expect Dr. North to agree entirely with Mrs. Flint. She told me—"

"Mama!"

"I think Dr. North ought to know how she talks about him."

"Ah, I knew she would justify my character of her. You have made me happy for the day. Good-by. Good-by, Miss Leigh."

## XVIII.

ST. CLAIR, a day later, was in what Vincent called the indefinite mood. When in this state he wandered, or rather drifted, whither the tide of accidental encounter took him. These mental states were apt to be followed by days of impassioned work with the pen or molding-iron. But when idle, he would drop in upon Vincent or Clayborne, meander about among books of law or history, complain with child-like disappointment if their owners could not go out with him, and at last slip away silently to feast his eyes on the colors of the piled-up fruit in the old market-sheds, or to walk for miles in the country, have what he termed a debauch of milk at a farm-house, and return home late at night.

About eleven in the morning he found himself (for it was literally that) in Clayborne's study. The historian looked around. "Take a pipe? Cigars in the case; cigarettes in the drawer; books on the table. I am busy."

The final remark was quite useless. "So am I," returned the poet. And this exasperated Clayborne into attention. He shut a huge folio with such vigor as to disturb the gathered dust of other lands, and said savagely:

"Busy! You don't know what it means."

"My dear fellow," returned St. Clair, "I am so happy to-day. Don't moralize. Be glad some fellow carries his Garden of Eden always with him. No; don't consider it affectation. You are a misery-mill; I am a flower-press. And, really, grumble seems to be your normal diet. Just now you think you are unhappy because some other man has said you make mistakes or come to wrong conclusions. It is a disguised joy. You are not truly unhappy. As for me, I do not care a cent what any man

thinks of my statues or my verses. I simply live. That is joy. I am contented. Why not leave me to my happy follies? North says I have never achieved moral equilibrium, and that's very fine, I dare say."

"I suppose," said Clayborne, after a moment's deliberation, "that moral equilibrium means serenity of mind."

"Now is n't that a little feeble?" retorted the poet.

"I rather think you are correct," said Clayborne, judicially. "I take it that serenity of mind is acquired, and is a state of content intellectually procured. Whereas you never acquire anything—I mean through experience."

"Quite true, and how nice that is! With you for knowledge, Vincent for a conscience, Mrs. Vincent for a confessor, and North—by George!" he cried, rising, "I wonder if he left a card for me. I asked him to. You ought to see that woman."

"You are like a book without an index," said the host. "What are you after now? What woman?"

"Oh, her figure and serenity! You should see her when her face is at rest, and then when it smiles. And her eyes! Come and take a walk. It's Miss Leigh I mean."

"Oh, that girl, Mrs. Vincent's latest enthusiasm. My dear boy, take care. I think I see you with Mrs. Leigh for a mother-in-law. You will need no other censor. It would be the thing of all others for you."

"So says Mrs. Vincent. I have several people who attend to my interests and doctor my morals. And you will not walk? Then I think I shall go and call on the Leighs. I should immensely like to model that hand."

"Best tell Mrs. Leigh so," said Clayborne, with a grim smile.

"I think I shall," returned St. Clair, simply. "And now you may demolish that critic; my malediction on him. Good-by."

After this he went away, and on the street bought a lot of roses and went along smelling of them, until of a sudden he was aware of Mrs. Vincent, who said as they met, "I suppose these flowers are for me."

"If you like. I was going to call on Miss Leigh."

"And Mrs. Leigh, I trust," said Mrs. Vincent, demurely.

"And Mrs. Leigh," echoed he, with resignation. "The stem of the rose." Then he added disconnectedly, "Clayborne knows them. I don't like that woman. I did not know it until I got away the other night."

"Oh, she is really nice. Don't nurse prejudices; when they get their growth they become difficulties and embarrassments. And you see

—well, I want you to like them. I mean the Leighs."

"I do. Is n't that girl superb? Come with me. If you don't, I will not go at all."

It thus happened that the two found Mrs. Leigh home and alone.

"I met Mr. St. Clair on the way to call on you," said Mrs. Vincent. "And how are you all? And my dear Alice, is she visible?"

"No; she is out—as my Ned says, gone to visit some of her social cripples."

St. Clair looked up. "What are social cripples?"

"Oh—social cripples."

"I think I must be one," said St. Clair. "And perhaps Mrs. Vincent could persuade you to consider my claims. I have some people coming to afternoon tea at my studio."

"I fear that we are engaged," returned Mrs. Leigh. "Really—"

"But you do not know the date yet. How can you be engaged?"

"Oh, we shall be, I am sure."

"Not for *my* tea," said Mrs. Vincent. "This is mine, you know. I permit Mr. St. Clair to lend me his studio. We will talk it over later. I want your advice as to some of the arrangements. And now, about the children." After which there was talk between the two women, while St. Clair fell into a reverie, or with mental disapproval considered the furniture, until, at last, Mrs. Vincent rose, saying, "And now Mr. St. Clair and I must go. I saw your carriage at the door."

"Good-by," said St. Clair, to her amusement and annoyance. She was afraid to leave him, but nevertheless he stayed, and, as they said a word or two, surveyed the pictures. Then, being alone with Mrs. Leigh, who remained standing for a moment, he said:

"Don't you think pictures are very embarrassing things? They are so like acquaintances—so welcome at first, and then after a while one gets tired of them. Now here is this Corot with its ghosts of trees—"

"I never care for Corot," said the hostess; "and as for acquaintances, I—"

"Oh," he interrupted. "Pardon me, you were going to say that an acquaintance is a person with whom we are really not acquainted. Language is such a fraud. It ought all to be made over—and some other things, manners, for instance—"

"I can imagine the need for that sometimes," said Mrs. Leigh, severely. She felt as if some bad boy had exploded a pack of fire-crackers under her august petticoats.

"Oh, I feel it," he went on, laughing. "And if one could arrange an exchange of manners, it would illustrate the idea neatly. Now, if you and I could effect such an exchange."

"Good Heavens! I prefer to keep my own," said she, shocked out of conventional propriety, and amused despite herself.

"But why not? Then I know you would be sure to say, 'Of course I shall come to your tea.' And you will come, I know"; and he looked at her with a waiting, devoted expression which had been but too often serviceable. Even Mrs. Leigh relented a little. "We shall see," she said.

"Oh, you will come," he said. "And to think of it, I once stood near you in Paris, and just as I asked to be presented you went away."

"And where was that, pray?"

"Oh, at the Comte St. Clair's, a far-away kinsman of mine. You know—or do not know—that we were Irish, and came to France long ago. My branch became Huguenots, more 's the pity."

"Indeed. Why a pity?"

"It lacks picturesqueness. Once it had flavor of romance. It has none now. I ought to have been a Catholic."

"And what are you now, may I ask?"

"I am nothing."

"I am sorry to hear it."

"Oh, it has its conveniences. I feel that constantly."

"I trust so, indeed."

As usual, he took little note of irrelevances, but went on: "I often like to fit people with the religion for which they were plainly meant. Really, as Clayborne says, or perhaps it was Vincent, the outward forms of religion are their manners. Some are stately, some common. But I have kept you. I must go."

(To be concluded in the next number.)

*S. Weir Mitchell.*

ROSWELL SMITH.

DIED APRIL 19, 1892.

HERE where I, sitting in my place,  
So oft have seen you at the door,  
A lad comes with indifferent face  
To tell me we shall meet no more.

The Old World pity of slow ships  
Was kinder than this flashing speed;  
The first short sigh on western lips—  
I hear it plainlier than I need.

The paper flutters to the ground.  
Cold wastes of ocean scarcely part  
Your voiceless mouth that makes no sound,  
And silence of my beating heart.

Vain, vain are words! I sit alone,  
And helpless sorrow westward send.  
Roar louder, London's central moan,  
My world is poorer by a friend.

In this first hour, while thought is blank,  
I dwell on all that made you dear;  
And for the gracious past I thank  
Whatever now can feel or hear.

The gentle mode, so subtly leagued  
With moral power and mental health,  
The courteous patience unfatigued,  
The cordial wish to please by stealth!

That lifelong flame which rose and fell  
By purest purpose still was fanned;  
That stringent will which planned so well—  
For others, not for self, it planned.

## ROSWELL SMITH.

ONE who is bidden to write for the pages of THE CENTURY MAGAZINE some words in memory of the man whose name stands above this article might well recall the often-quoted inscription in St. Paul's Cathedral, under the name of its architect: "*Si monumentum requiris, circumspice.*" Other memorials of his life, beautiful and enduring, can be pointed out; but it is in this magazine that the fairest and most permanent results of his work will abide. To have borne so large a part in originating and establishing an agency like this would be a sufficient distinction for any man. It is difficult for those who have known something of the history of this magazine from its foundation to separate it, in their thought, from his vigorous personality. We may doubt, indeed, whether this is possible. Roswell Smith gave his life to this magazine; we might almost say that he gave his life for it; the vital force that he imparted to it will not soon be spent.

Roswell Smith was born March 30, 1829, in Lebanon, Connecticut, a small town in the northern part of New London County, of which the cyclopedia knows only that it "contains several villages and has important manufacturing interests." But Lebanon, though beneath the notice of the cyclopedist, is not the least among the thousands of Yankee-land, for out of her came the great war governor of the Revolution, Jonathan Trumbull, one of Washington's most trusted friends, and the man to whom, through Washington's familiar appellation, we owe our national sobriquet of "Brother Jonathan." This was no mean family: one son of Jonathan, Joseph, was a member of the Continental Congress; a younger son, Jonathan, was United States senator, and in his turn governor; and the second Governor Jonathan's son John was the great historical painter. Other notable names besides the Trumbulls are found in the annals of Lebanon; it has been the seed-plot of theology as well as of statesmanship and art; but the patriotic traditions of this one distinguished family must have taken strong hold upon the mind of Roswell Smith: for the historic Trumbull mansion had come into the possession of his father, and was the home of his boyhood.

From his fourteenth to his seventeenth year he served a brief apprenticeship with the pub-

lishers of the school-books of his uncle, Roswell C. Smith, in New York; then, having apparently satisfied himself that a little more learning would not be a dangerous thing, he took up the English course in Brown University, and after finishing that course began the study of law in the office of Thomas C. Perkins of Hartford, a most accomplished lawyer. It was about this time that his father, who had become somewhat concerned on account of the frequent changes in his plans of life, repeated to him one day the old adage about the rolling stone. "Well, father," answered the youth, "I don't know that I care to gather moss." That was not what he was after when he turned his steps to what was then the distant West, and in the ambitious young town of Lafayette, Indiana, began the practice of his profession. It was a capital school for the callow lawyer; his conceit was sure to be rudely chastised in that rough Western world; all his conventionalities would be challenged; if he had any convictions, he must fight for them. Roswell Smith always highly valued the experience which he gained in the West. "Every man," he once wrote to one who was looking in that direction, "ought to go to the West and live there a few years of his life at the least. You will like the West, and will have a freedom and a growth you never experienced before." In the life of this community, passing through its formative stages; in the conflict with the lawlessness of the frontier; in the shaping of institutions to meet social exigencies; and in the rapid development of the industrial order, the young man learned much practical wisdom. He was always recurring to this period of his life, and he thought that no man was well equipped for the competitions of the great metropolis unless he knew by actual contact something of the life beyond the Alleghanias.

In 1852 Roswell Smith set up his home in Lafayette, bringing into it Annie, daughter of Henry L. Ellsworth, the first United States Commissioner of Patents, and granddaughter of the illustrious Oliver Ellsworth, Chief Justice of the United States Supreme Court. Sixteen years of active life in Indiana, in the practice of law and in real-estate operations, had brought to him a moderate competence; and, disposing of his business in Lafayette, he sailed with his wife and daughter for Europe, purposing on his return to devote himself to

the business of publishing books or newspapers. From his youth he had had the strongest faith in the power and value of the printed word; he recognized in it the principal agency by which public opinion is generated and guided; and the wish to do something for the improvement of society by this agency had long been cherished. During this European tour he fell in with Dr. Holland, whom he had slightly known as a lecturer in the West, and whose ethical quality of mind had a strong attraction for him. Several months of companionship in travel ripened their acquaintance into intimacy. Dr. Holland had just sold his interest in the "Springfield Republican." His very successful "Life of Lincoln" and his other books had brought him a good fortune, and he, too, was looking out for some opportunity to invest his gains, both of capital and of experience, in the service of popular education. I have often heard both Dr. Holland and Roswell Smith allude to the memorable night when, standing upon one of the bridges that span the rushing Rhone at Geneva, Dr. Holland outlined to his friend a project, which he had been maturing, of a monthly magazine devoted to American letters and American art. The emphasis rested upon the adjective: the work was to be done in America, by Americans, for Americans; it was to be a popular educator of the highest grade. Roswell Smith promptly seized upon the project. The two friends soon returned to America, and in connection with the firm of Charles Scribner and Company, who were Dr. Holland's own publishers, they founded the corporation which now bears the name of The Century Co., and began the publication of this magazine. At a later date the "St. Nicholas Magazine for Young Folks," which originated in a suggestion by Roswell Smith, was added by the purchase and consolidation of several lesser periodicals, and the editorial care of it was committed to the competent hands of Mrs. Mary Mapes Dodge. The changes through which this organization has passed have been made known to the public, and most of these facts concerning the origin of the enterprise are familiar to many; but it seems fitting that some permanent record of the part taken by Roswell Smith in its foundation should appear upon the pages of THE CENTURY MAGAZINE.

In seeking to gather up for grateful recognition some of the finer qualities of Roswell Smith, my thought first rests upon a certain largeness of conception which characterized all his undertakings. He liked to do great things; he had the courage that is not appalled by difficulties, and the faith that removes mountains. The "St. Nicholas Magazine" was started in the very moment of wide-spread

commercial depression. His plans for the extension of the sale of the magazines were bold and enterprising; his ambition was to make them as good as they could be made, and he grudged no outlay for this purpose; his confident expectation was that the best thing would turn out to be the most profitable. His residence in the West had given him large ideas respecting the publisher's field: he thought that the West and the South as well as the North and the East were cardinal points in the publisher's compass. When the magazines had won their footing on this continent he boldly carried them to England; what was good enough for Americans was good enough for Englishmen. This was the first invasion of the British market by the American periodical. The large success of the undertaking opened the way for other publications; and American magazines, now on sale on every bookstand, have exerted an important influence upon English opinion concerning America.

The quality of his mind is illustrated by the project of "The Century Dictionary." This was purely his own. The scheme of owning and publishing a great dictionary of the English language laid hold upon him many years ago. "It is an open question with us"—so he wrote eleven years ago—"whether it is best for us to buy one of the leading dictionaries and build on that, or to organize the scholarship of the English-speaking world and make a new one. There must be one English language, and a common standard of the English tongue." He saw no reason why this should not be published in New York. The purchase of the right to revise and republish "The Imperial Dictionary" in America laid the foundation of this enterprise. It was thought at the outset that a "slight revision" would fit the four volumes of the "Imperial" for the market; but the scope of the work at once began to broaden; and before anything had been realized from the sale of the dictionary, nearly fifty times as much money was expended as had been provided for in the original estimate. In all this his courage never faltered. The ambition to "make it what it ought to be" was far stronger than any financial consideration. His satisfaction in the perfection of the work, his sense of its value to the world, were to him a great reward. It was precisely in such concerns as this that the peculiarity of his mind appeared. The importance of a work like the making of a great dictionary was obvious to him. He could see its relations to all science, to the spread of accurate knowledge in the world. He knew that language is the instrument of thought, the medium of communication, the vehicle of truth; that whatever makes it more precise, more lumi-

nous, more perfect, is a great benefit to all men. How many of the disputes that have disturbed the Church and convulsed the State have grown out of verbal ambiguities. How much of the dogmatism that infects philosophy as well as religion would disappear if men would only study and understand the history of the words they are using. An improved and perfected philology, based upon historical research, which gives us the elements of the words that are in our mouths every day, and shows us how they have come to stand for the ideas which we assign to them, is certainly not less important to civilization than the new chemistry which reveals to us the elements of which physical bodies are composed. And the ambition to carry this work of linguistic exploration and analysis to the very highest perfection, so that the English language may be known in all its roots and branches, and all its terms may be used with the greatest possible precision, was certainly a lofty ambition. The rank which has been assigned to this publication among literary enterprises in this country is well known. It is only important to remember what is said about it, in the preface, by its distinguished editor: "The design originated early in 1882 in a proposal to adapt *The Imperial Dictionary* to American readers, made by Mr. Roswell Smith, President of *The Century Co.*, who has supported with unflinching faith and the largest liberality the plans of the editors as they have gradually extended far beyond the original limits."

An instance of his large administrative ability is seen in the reform which was made several years ago, at his suggestion, in the method of handling second-class matter by the Post-office Department. Formerly the postage on all periodicals passing through the mails was paid by subscribers; or, if prepaid by publishers, a separate account was made of every copy. Roswell Smith proposed to the authorities that the periodicals be weighed in bulk and prepaid by the publisher. The simplification of the method saves an indefinite amount of petty detail and annoyance to both publisher and subscriber, and doubtless has introduced into the department a considerable economy.

Roswell Smith's mind was not only large in the scope and range of its activity, it was exceedingly fertile. His brain was teeming with new enterprises and new methods; suggestions poured into every department of the business. These were not all practicable; and when they were not, discussion generally revealed the fact to him. His mind was as bountiful as nature herself in producing varieties of ideas; under the natural selection of free debate, he expected the fittest to survive. His friends, in all

callings, are indebted to him for many quickening hints. His vital mind tended to fructify every theme that it touched. In my work as a pastor he has often given me useful suggestions, and the most popular contribution that it has been my fortune to make to *THE CENTURY*, "*The Christian League of Connecticut*," sprang from a request made by him. "I want you," he said, "to write a kind of a story showing how the Christian people of some town got together and learned how to cooperate in Christian work." The elaboration of the idea was my own, but the idea was his, and justice to him requires this acknowledgment.

To this magazine Mr. Smith's only literary contribution was a brief poem, published in one of the early numbers; but he found pleasure, as did many of his young readers, in two short stories which he wrote for "*St. Nicholas*."

Mr. Roswell Smith was deeply interested in all the current movements of politics and religion. The failure of the Independents in 1884 to organize a new party he greatly deplored; it seemed to him that the time was ripe for a new grouping of the political elements. The attempt to keep the fires of sectional hatred burning was utterly distasteful to him; he strongly desired that the North and the South should come to a better understanding. The series of papers on "*The Great South*," published in the magazine under its old name, was suggested by Roswell Smith to Dr. Holland, and it aided, no doubt, in bringing about a better state of feeling. Yet this wish for more amicable relations between the two sections was not due to any lack of interest in the welfare of the Southern negroes, as his work for Berea College amply testifies. This institution, on the borders of the mountain district of Kentucky, in which both sexes and both races are educated together, was one of the special objects of his care; the broad humanity of its foundation, and the directness of its ministry to the neediest human beings, commended it to his sympathy.

Roswell Smith's interest in religion was deep and abiding. His faith was as simple and unquestioning as that of Faraday; his appeal to divine guidance in every matter of importance was as natural and habitual as that of General Gordon. The direct intervention of the divine power in human affairs was to him a living reality. The institutions of religion were his special care. Though of Congregational origin, he was for the greater part of his life a member of the Presbyterian Church, and the Memorial Church of that denomination in New York (now the Madison Avenue church) owes much to his brave financial leadership. He was not, however, the kind of man whom any sect can monopolize: for many years

he was the President of the New York Congregational Club, and he worshiped during the last years of his life with one of the Reformed churches. The wish for a closer and more practical unity among the churches, which found expression in the suggestion about the Christian League, was always in his heart. He was a vice-president, I think, of the American Congress of Churches, which undertook to do something for Christian union in this country; and, as an officer of the American Tract Society, he strove to rejuvenate the life and enlarge the function of that venerable institution. One of the books published by The Century Co., "Parish Problems," revealed Roswell Smith's desire "to do something to help the minister." His motive in undertaking the publication was to make a book in which the people could be shown how to cooperate in the work of the local church. He wished thus to say to the members of the church many things which they greatly need to hear and which the minister cannot say; it was to be a treatise in parish theology, to offset the instruction in pastoral theology which the minister receives in the seminary. This desire to serve the churches found expression in a movement, to which he lent his influence and his personal cooperation, to lift the load from churches which were burdened by debt. Roswell Smith entered upon this work with enthusiasm, and had the satisfaction of seeing a number of churches set free from their encumbrances.

It is not to be supposed that this great publisher was beyond the influence of the motives which usually control men of business. He wanted to succeed in his business. To the expectation of wealth his mind was not inhospitable; but he meant to conduct his business in an honorable way, and, more than this, he was glad to make it tributary to higher interests. If he could see that a given venture was likely to aid the churches, this fact added greatly to its attractiveness. The publication of hymn and service books, in which he has been a leader, was not wholly a matter of business with him; the purification and elevation of the psalmody of church and Sunday-school enlisted his enthusiasm. In the last serious conversation which I had with him, he opened to me a great scheme with which his mind was laboring—to organize the best Biblical scholarship of this country for the translation and publica-

tion of a popular edition of the Bible. He proposed to follow mainly the suggestions of the American revisers; perhaps also to make such judicious selection of Biblical material as would better fit the Sacred Scriptures to be read through in families. No man had a deeper reverence for the Holy Book; but he was of the opinion that its value for popular use might be increased by a careful collection of its more nutritious parts. I sought to dissuade him from the enterprise, which he was in no condition of health to undertake; but the bent of his mind appears in the proposition.

It is not, however, in these specific plans that his religious purpose was realized so much as in his deeper intention to make all his work as a publisher serviceable to that kingdom for whose coming he prayed. He desired that the two magazines, especially, should be powerful instruments of righteousness. That the tone of them should always be elevated; that nothing impure or unworthy should be allowed to appear, in them; that they should never be permitted to assail or undermine genuine faith or pure morality; that they should pour into the community a constant stream of refining influence,—this was his central purpose, his lofty ambition. The efforts of his editors in this direction he always heartily supported. I know well, from many conversations with him, how deep and serious was this desire. I should do my friend a great disservice if I tried to convey the impression that he was not a keen, far-sighted business man; but I believe that he was something more than this, and that all his thoughts about business were affected and, to some good degree, shaped by the wish and the hope to do something for the improvement of the world in which he lived. He meant to be, and he believed himself to be, a co-worker with God. The issues of the presses that he had set in motion were spreading light and beauty, truth and love, among men; they were helping to make the world better every day. He knew it, and gloried in it. With all the personal satisfaction which he derived from the success of his business ventures was mingled the deeper feeling of thankfulness for the privilege of serving the higher interests of his fellow-men. Roswell Smith was not a flawless character—not many such long remain upon the earth; but the works that follow him bear witness of large thoughts, noble aims, and fruitful labors.

*Washington Gladden.*

#### THE AMERICAN TRACT SOCIETY.

ROSWELL SMITH, from early manhood a life-member of the American Tract Society, was quickened to a new interest in its affairs

when his pastor, the Rev. Dr. Robinson, became editor of its "Illustrated Christian Weekly," which interest culminated at the annual meet-

ing of 1886, when on his motion a committee was appointed "to inquire into the practical workings of the society, and to recommend such changes in its constitution, methods, and management as may seem desirable." Declining to become the chairman, he accepted the position of secretary of the committee. The resolution directed the committee "to make a thorough examination of all the affairs and business of the society," and as executive secretary the burden of the duty and responsibility fell upon him, though the whole was shared by his associates, the Hon. Nathaniel Shipman (chairman), General Wager Swayne, the Rev. Talbot W. Chambers, D. D., Chancellor M'Cracken, the Hon. James White, and Mr. Robert Colby.

Their report was thorough and comprehensive. It introduced vital changes in the constitution and methods of the society. Though not inerrant, after consideration and full discussion in two public meetings, it was in the end adopted June 1, 1887, with few if any dissenting voices. The five subsequent years of practical working have attested in the main the wisdom of the changes then made. At the annual meeting of the same year Roswell Smith was elected a member of the Finance and Executive committees, in which he continued by succeeding elections until his decease.

His peculiar gifts as a publisher, which placed him easily in the front rank of the men in that sphere, added to his desire to make the most of his life for the Lord, and for his fellow-men for Christ's sake, were the prime elements in the quickening which occurred about 1887. The opportunity now brought

to him to put his hand to the execution of the plans which he had desired and the society had adopted, came to him as a providential call to service and, if need be, to sacrifice; and thenceforth, whatever were the enactments of his own extensive business, his life was freely given to the interests of the society. His practical knowledge of the publishing business, fertility of suggestion, sound judgment, and large acquaintance with and love for missionary effort made him a most helpful member of the committee.

He was a truly catholic Christian. One of his cherished purposes, to which he gave much thought and personal work, was a plan for close coöperation, or even a union on some general basis, between all the great American denominational publishing societies. But serious illness overtook him, and of necessity he was constrained to remove his hand from what he hoped would be the means of furthering and demonstrating the unity of all evangelical Christians.

As weariness and weakness in the past two years stealthily crept over him, from time to time he recalled with peculiar delight his association with the men whom he esteemed and loved as members of the committee, and his satisfaction in the retrospect of his work in connection with the society. It is almost needless to add that this view is most cordially reciprocated by the officers and members of the American Tract Society, to which his decease is an irreparable loss.

*G. L. Shearer,*

*Financial Secretary of the American Tract Society.*

## THE CONGREGATIONAL CLUB.

For six years Roswell Smith was the honored President of the Congregational Club of New York and vicinity. For most of that time he was a member of the Memorial Presbyterian Church, but his membership in that church was determined by his personal relations with its pastor, the Rev. Charles S. Robinson, D. D. His sympathies were heartily with the Congregational churches, and his gifts for benevolent work chiefly through their missionary boards. Soon after the organization of the club he was elected to its membership, and in 1883 was chosen President. The outlook of the club at that time was not promising. No permanent and desirable place for its meetings had been found, and that, with other facts, had discouraged many of its members. When Mr. Roswell Smith assumed its presidency a new and brighter era began. He brought to the office large practical wisdom, wide knowledge of men, and exceptional opportunities for

curing speakers. From the beginning of his administration to its end the Congregational Club offered the best program of any club in New York whose primary object was the discussion of topics of current interest. The platform was always free; speakers were encouraged to give their honest thought, and were not asked whether it coincided with the views of the President or membership. One subject in particular had an especial interest for our President. Some time before his election the following question had been discussed, "Is it possible to do business on Christian principles?" A very prominent banker, who was also a prominent church member, maintained that Christian principles were one thing and business principles another. I have never seen Mr. Roswell Smith more indignant than when referring to that discussion, and he was not satisfied until it had been considered again and he had borne emphatic testimony to his

faith that the only way in which business can be conducted with prospect of permanent success is by a strict adherence to the teachings of Christ.

The publisher of *THE CENTURY*, of course, had unequalled facilities for securing the participation of eminent authors and public speakers in the discussions of the club, and few, if any, persons whose names were prominent in the pages of *THE CENTURY* during his presidency of the club failed, at some time, to appear at its meetings. In his intercourse with its members Mr. Roswell Smith was always the urbane Christian gentleman; in his conferences with its officers he was always courteous and considerate. We felt that he gave to us his best thought, and the club had unquestion-

able evidence that while it honored itself by choosing him as its President, it always had a large place in his heart. In 1889 failing health compelled him to decline reelection to the office, and while he has seldom been seen at the club since that time, his name has often been mentioned with sincere and reverent regard; and in no organization of which he was a member will his memory be more fondly cherished and his loss more deeply mourned. In all the years of his connection with the Congregational Club, during most of which he was its President, its members will recall not a single act or word that was not courteous and Christian, and its present conspicuous success is universally regarded as very largely due to his wisdom and devotion to its interests.

*Amory H. Bradford.*

BEREA COLLEGE.

ARCHITECTS' DESIGN FOR LINCOLN HALL, BY BABE, COOK AND WILLARD.

MR. ROSWELL SMITH'S first gift, one thousand dollars, was sent through the American Missionary Association in 1884 for our current expenses. In June of the following year he, with George W. Cable, attended our commencement. He saw our urgent need of a suitable building for class-rooms, library, etc., and remarked that we should begin making bricks. One of our workers mentioned the difficulty of making bricks without straw. Mr. Roswell Smith at once replied, "Put me down for five thousand for straw." We began making bricks that summer, and in the end he put twenty-five thousand dollars into a new building for us. One of the most characteristic letters from the large correspondence had during the progress of the building was written January 7, 1887, in which he says: "I hope the college will get on without calling on me for more money, *but* I shall be ready to respond to calls as fast as may be necessary to keep the work in progress, and I wish you to call on me freely for that end."

When the building was nearly completed we asked him to christen it. He wrote to call it "Lincoln Hall," in memory of the poor white boy of Kentucky who had won the hearts of his countrymen and the highest honors they could give.

After we had been in the building a few months, the following letter was received:

"NEW YORK, Nov. 24, '87.

"MY DEAR MR. DODGE: I am glad to know that the building—Lincoln Hall—meets your needs and gives you so much pleasure. I have a picture of it in my office, and it certainly gives me more pleasure at present than my new house, which I am trying so hard to get into, and can't.

"I have written to Mr. Hartley about the bas-relief of Lincoln, and shall doubtless be able to advise you in that matter within a few days.

"I am very sincerely yours,

"ROSWELL SMITH.

Mr. Roswell Smith wished a bas-relief of Lincoln to be placed in the vestibule of Lin-

coln Hall. His next letter was in reference to that, and is as follows:

“NEW YORK, Nov. 29, '87.

“MY DEAR MR. DODGE: I have purchased from Mr. J. S. Hartley a bronze cast of the Lincoln head, duly framed, and suitable for hanging up indoors in Lincoln Hall. . . . I hope it will reach you before Christmas.

“Will you kindly thank Mr. E. H. Fairchild for his letter of Thanksgiving Day, and tell him that he is unduly alarmed as to my health? As Mr. Lowell said yesterday, in his address on Copyright, ‘We are all of us, always, just beginning to live.’

“I am very sincerely yours,

“ROSWELL SMITH.”

Besides the new building, we received from him four thousand dollars for current expenses.

His last gift and last letter came after the exciting political campaign of four years ago.

“NEW YORK, Dec. 31, '88.

“MY DEAR FELLOW-WORKER FOR CHRIST: I wish you a Happy New Year, and I send you a thousand dollars for your work, which please use (after consulting Pres. Fairchild) ‘where it will do the most good,’ as the politicians say, and may the Divine Master’s blessing go with and attend its use.

“I am yours sincerely,

“ROSWELL SMITH.”

Our sympathies are with the family and friends of this good man.

Very truly yours,

*P. D. Dodge,*

*Secretary and Treasurer.*

BEREA COLLEGE, KY., April 21, 1892.

#### FROM THE REV. DR. EDWARD B. COE’S FUNERAL ADDRESS.

It was a fortunate circumstance, but it was not an accident, that during a visit to Europe, twenty years ago, his thoughts were turned toward the literary project with which, in its subsequent development, his name will long be associated. I say it was not an accident, because, as one who knew him well has stated, “to be identified with a business which had to do with books and writers had always been his ambition.” In other words, he was looking for a field of wider and more direct influence and usefulness than that which he had thus far found. Though he was not himself a practised writer, he had a quick sympathy with those who like himself were men of ideas and earnest desire to promote the intellectual as well as the moral life of the community.

The opportunity was precisely that which would best meet his genius and his tastes, and give free play to his peculiar talents. It brought him into intimate relations with intellectual and scholarly men, whom he needed and who needed him. With rare tact and discernment he left them free to do their work in their own way, making innumerable suggestions, but never giving orders, while he inspired them with his own

confidence and enthusiasm, and placed at their service his extraordinary executive ability. He had the utmost possible faith in his associates, in himself, in the work which they were together doing, in the public on both sides of the Atlantic, and in the certainty of ultimate success. He never lost heart in the darkest times. He assumed immense responsibilities without hesitation. He worked his way steadily through difficult negotiations. His plans were often startling in their boldness, but his patience and perseverance were equal to his audacity, and the novelty of his methods was sometimes the secret of their success. In his dealings with other men he was high-minded and generous often beyond the strict demands of justice, giving more than he was compelled or asked to give, from a conviction that the Golden Rule may safely be applied to mercantile transactions. There was, if I may judge correctly, something statesmanlike in his conduct of the business interests of which he was at the head, while there was also something romantic in his feeling about them. To his mind The Century Co. was not a concern for making money, but an organization for the advancement of civilization.

## TOPICS OF THE TIME.

Roswell Smith.

BEHIND every successful enterprise one may be sure there is somewhere at work, even if not always prominently in sight, a powerful personality. The personal force—alert, original, full of initiative, insistence, and enthusiasm—which has been from the beginning, in 1870, up to the past year or two of illness, behind the publishing corporation now known as The Century Co. was that of Roswell Smith. Others may express in these pages their impression of the man in the various phases of his aspiration and activity. It is, perhaps,

only necessary for the present writer to record here the grief of all associated in business with our late President at his untimely departure, and to say a word regarding especially his relation to THE CENTURY MAGAZINE.

We do believe that Roswell Smith came nearer realizing the strictest editorial idea of what the publisher and chief owner of a periodical should be to that periodical than has often been seen in the literary and publishing world. Trusting the persons chosen to take editorial charge in a manner to call out all the energies and abilities of those so generously confided in, he spent no part of his energy in thwarting or

diverting their control, but set all his great strength to the task of enthusiastically coöperating with the plans of the magazine,—making possible, by his appreciation, courage, and loyal and liberal support, enterprises in their way of unprecedented cost and importance.

It was always an idea—always the ideal—that, appealing to his imagination, drew forth his deepest and most active sympathies. It was especially ideas of usefulness, of patriotism, of humanity, which commanded his most practical and zealous activities. The famous War Series of *THE CENTURY* could not have been carried on with a publisher of a timid and time-serving disposition. The authorized Life of Lincoln was made available to the great mass of the people largely through the liberality and determination of Mr. Roswell Smith. When George Kennan was gathering in long and painful journeys the material for his great work on the Siberian Exile System, his most frequent and most sympathetic correspondent, outside of his own family, was the busy President of *The Century Co.*

He not only earnestly supported the most costly and wide-reaching plans, but from his direct suggestion came magazine enterprises of breadth and moment. Nor was it only in large matters that his mind was active and helpful. In many details connected with the appearance of the magazine he made improvements: for nothing to him was unimportant that tended in any way to the perfection and good repute of the publications with which *The Century Co.* was identified. More important than everything else,—in addition to his sympathetic attitude, his suggestiveness, his faculty of invention, the fertility of his resources,—there was for all near him a constant inspiration and spur to highest effort coming from his fervid faith in God and man; his unswerving confidence in the success of generous methods and lofty and beneficent ideas.

To its President *The Century Co.* was truly an individual, beloved as a favorite child. There was hardly a waking hour of his life, especially after the company entered upon a separate existence, in which he was not pondering on and planning for its enterprises present and to come. When physical infirmity weighed heavily upon him, in the last weeks of his long and heroically endured illness, his failing power was expressed by himself with manly and smiling pathos, when, sitting one day in his old chair in his own office, he said, "My only contribution to *The Century Co.* now is one of curiosity." He, and all of us, well knew that when such words could be truly spoken the end must indeed be near.

It seems hard that there should not have been for him an old age of rest and satisfaction in witnessing and enjoying the fruits of such devoted labors,—labors which were indeed essentially public in their scope and intention. But, after all, our friend and associate had in his life the reward of clean, congenial, and successful work. He took his pleasure in his labors as they went on; and he had so poured his individuality into the corporate life which was largely his creation that he seemed to see much of his own personal energy and individuality existing along the future in forms of usefulness to mankind.

Roswell Smith had somewhat of the reserve attributed to the New England character, and his mind was concentrated on the principal work of his life with peculiar intensity. Yet collectively and individually his

business associates and employees have all and each at various times, and in many an hour of stress and trouble, found in him a kind, sympathetic, and generous friend. There are men of letters in this country whose lives have been made smoother and brighter for his faith in them, and his friendly and substantial encouragement, professed in all respect and manliness. He has done a good work in many ways; in a sense no one can "take his place"; but the spirit in which he labored will not soon fail of inspiration for his survivors and successors.

It was part of the late President's prevision and care that his large interests should remain within the company, and that the business management should continue in the hands of his trained and chosen associates.

#### Growth and Change in College Education.

In an extremely interesting and valuable paper which he published in the February number of "The Educational Review," Mr. Arthur M. Comey showed that the number of male students attending 282 colleges in various parts of the United States had nearly doubled in the decade between 1880 and 1890, though the increase in population during the same period had been only 25 per cent. He showed also in a series of clear and most carefully compiled tables that between 1850 and 1890 the number of male students in these colleges had increased from 8837 to 31,359; that while the increase in population during that period had been 165 per cent., the increase in the number of students had been 254 per cent.; and that the number of students per 100,000 of population had risen from 38.1 in 1850 to 50.3 in 1890.

In making up his tables, Mr. Comey omitted all students in the preparatory courses of many Southern and Western colleges, and all women in the coeducational institutions. He omitted also a few colleges on account of low standard, and all the scientific schools, though he included scientific students in colleges. Had he included the scientific schools, which have been organized almost wholly since 1860, the percentage of increase would have been far greater than appears from his tables. His conclusions are that the "colleges of the country are growing rapidly," that "there is at the same time a decided tendency to raise the standard both for admission and for the courses of study," and that these facts justify "even optimistic views of the future of higher education."

The figures are certainly encouraging, as showing a constantly increasing desire among the youth of the country to pursue their studies beyond the limits of the public schools and seminaries. But what does Mr. Comey mean by the term "higher education"? That there is a wide difference of opinion among professional educators themselves on this point is made evident by an article which President Gilman of Johns Hopkins University has in the same number of "The Educational Review," wherein he takes issue with General Francis A. Walker, President of the Massachusetts Institute of Technology; David S. Jordan, President of the new Stanford University in California; and Professor Goodwin of Harvard, as to what should constitute a liberal education. General Walker had contended that the scientific schools were doing a work "not surpassed, if indeed equaled, by that of the classical colleges,"

and are turning out "better-educated men, in all that the term implies, than the average graduate of the ordinary college." Messrs. Jordan and Goodwin had contended that old ideas as to what constituted a liberal education had passed away, and new ideas, adapted to the demands of the time, had taken their place. The new ideas, briefly summarized, are: not to compel all students to take the same course of study, with Latin and Greek as the basis, but to permit each student to take the course which best suits his tastes and abilities, and to supply for each student the best facilities for pursuing the course of his choice.

It is not our purpose to follow the ramifications of this discussion, or to attempt to decide which method of education can more accurately be pronounced "higher" or "liberal." The great and encouraging facts which Mr. Comey's statistics and the discussion disclose are that the colleges of the country are attracting a steadily increasing number of students, and are making such changes in their methods of instruction as enable them to extend their influence to fields hitherto not occupied by them. Upon one point the disputants are agreed, and that is that the main object of education is to make good citizens. General Walker calls it adding to the "manhood and citizenship of the country," and President Gilman, in a passage which deserves to be put on record as a comprehensive and accurate definition, says of "liberal education":

In every "liberal" course these elements should be combined: mathematics, ancient and modern languages and literature, science, history, and philosophy. The more one has of all these elements the better. It is obvious also that a "liberal" education is not to be limited by the period devoted to the college course or a course in technology. It begins in the nursery, it goes on in the domestic circle, it continues through school, college, and university, and ends only with life. All science, all knowledge, all culture, not essential to bread-winning, is "liberal,"

no matter whether it be acquired in the oldest or youngest university, in the old-fashioned college or the modern school of science. I may go further and say that "liberal" culture may be acquired without the aid of seminaries; scholars may appear in the walks of business, in the solitudes of rural life, on the boards of a theater, in politics, in philanthropy, in exploration; and they cannot be produced by narrow, cramping, or servile training.

All this amounts to saying that the best college course is only a beginning, and that its main purpose, its highest achievement, is to start the student in the right direction. "Culture," says Matthew Arnold, "is reading; but reading with a purpose to guide it, and with system. He does a good work who does anything to help this; indeed, it is the one essential service now to be rendered to education." That is what the college ought to teach first of all, and if the instruction be thoroughly imparted, the foundation of a liberal education is laid. Montaigne said he read books that from them he might learn "how to live and die well." Every student who is taught to read or study with a purpose finds in his books the secret of how to live and die well; that is, learns how to become a good citizen, that most valuable influence in a community. He carries into life a deference to acquired knowledge, a respect for the teachings of experience, which are of incalculable value among a people prone to think that they can solve all problems for themselves, and have no need to profit by the results of similar experiments by the generations that have preceded them.

Especially is this true of the study of political science, to which many of our colleges, following the excellent example of Harvard and Columbia, are devoting increasing attention. In this they are doing the whole country a most useful and greatly needed service: a subject which we shall soon discuss in its bearings on public life.

## OPEN LETTERS.

### The Pressing Need of Forest Reservation in the Sierra.

NONE too early comes the announcement that the Interior Department has under consideration the establishment of a very extensive forest reservation in California's Sierra Nevada, to the south of the Yosemite National Park, and including the wonderful King's River Cañon described by Mr. John Muir in the November CENTURY.

It will be remembered that by a recent enactment of Congress the President was authorized to withdraw from the offerings of public lands for sale those districts where the preservation of the forests might appear, in his discretion, to be necessary for the security of the supply of water for irrigation and other purposes. Under that act an important addition has been made to the Yellowstone National Park, and, more lately, a territory largely exceeding a million acres in extent has been designated as a reservation in the State of Colorado, the area thus set apart covering much of the higher watershed of the Colorado River. The projected new reservation in California would perhaps be the most

notable of all these judicious undertakings, whether the extent of domain be considered, or attention be turned to the varied splendor of the scenery, or to the effect as insuring a permanent yield of lumber according to the efficiency of the system of forestry, or yet to the influence on agriculture in the lowlands. As contemplated, the proposed reservation would include the sources to which the upper San Joaquin Valley, comprising the great counties of Fresno, Tulare, and Kern, must forever look for a supply of water for that irrigation which is necessary to successful agriculture in this land of inadequate rainfall. It would also include those steep declivities on which, if denuded of their restraining vegetation, the melting snows and falling rains would unite to form torrents that would, a little later, take the form of such devastating floods as have but recently taught the Spaniards how Nature revenges herself on those who trifle with her forces.

At present the population of the whole valley region overlooked by the proposed reservation is probably not more than 70,000 in number. Under comprehensive irrigation the land would easily be able to support sev-

eral millions of inhabitants, and all in a high average of rural or urban comfort. Even a cursory inspection of the wealth of those irrigated oases which have been created at intervals along the line of the railway, during the last dozen years, is enough to carry conviction that the head-gate of the irrigation ditch is the door to a future whose magnificence cannot easily be overdrawn by the liveliest fancy. In the county of Fresno alone there are now about 150,000 acres actually watered by means of canals, and thus brought into an admirable condition of prolific and highly remunerative husbandry. The canals existing would suffice for the irrigation of several times the acreage named, and the counties of Tulare and Kern are ambitious rivals of their neighbor in the matter of profitable agriculture through the vivifying influence of the ditch. Yet all that has been accomplished and the vastly greater results that may be accomplished in the proximate future are imperiled to satisfy the desire of a few men for gain, and by the supineness of the many in the face of dangers that promise disaster to the well-being of their children, if not of themselves.

That the hazards which have accumulated under the policy of indifference are not imaginary is perfectly well known to such persons as have considerable knowledge of the mountains. Not long ago one of the best-informed landed proprietors in the San Joaquin Valley related that he had traveled over about 700 square miles of the King's River watershed, and had rarely seen a tree under thirty years of age. The age of the youngest trees at all commonly noticeable would therefore nearly coincide with the invasion of the mountains by numerous bands of sheep, and with the attendant fires due to negligence or deliberate incendiarism. With no younger growth coming on and with the mature or maturing trees rapidly vanishing in flame, or by natural causes, it is easy to foresee what will soon be the fate of those forests (which are occasionally described as "inexhaustible") under the policy of public inaction. Add to the destructive agencies already at work the uncontrolled operations of lumbermen, who are only now beginning to push their industry on a formidable scale in the part of the Sierra in question, and the disappearance of the forests that stand guard over the welfare of the San Joaquin Valley becomes a supposition whose realization may well be witnessed by men now long past youth. "If the policy heretofore followed," says an unusually well-informed correspondent of the writer, "be much longer continued, we shall have so denuded the rock of our mountain ridges that within half a century all our streams will be torrents for a few brief weeks in spring and dry beds of sand all the rest of the year. Massive reservoirs of masonry will have to be built at vast expense to take the place of the beautiful reservoirs of pine and redwood which nature created."

With reference to the advisability of the projected reservation, the present writer was led of late to make some extended inquiry concerning the opinions held by men of acknowledged enlightenment, of large views, and whose interests in the San Joaquin Valley are of undoubted extent. The result of this inquiry was to disclose a uniform agreement in the idea that there should be an immediate abandonment of the old policy of *laissez-faire*. As fairly representative I quote, by permission, the substance of the reply made by Hon. C. C. Wright, a gentleman known to all Californians

as the author of the Wright Irrigation Act, whereby the system of irrigation districts sustained by public taxation has been introduced as one of the most noteworthy parts of the order of the State. Mr. Wright's letter says:

I think it would be universally admitted that the existing supply of water in the streams, if all conserved, is sufficient to meet present and, very likely, prospective uses, so far as the demands of irrigation go. The paramount importance of comprehensive irrigation is almost, if not quite, unanimously admitted. The interests to be served by the removal of the forests, as compared with those to be secured by comprehensive irrigation in the great valleys of California, are insignificant. So far as additional reservations will secure the use and deter the abuse of forest areas, they ought to be established. I consider Federal control and action as the only practicable means of affording the protection needed.

To the San Joaquin Valley the subject of transportation by water is second in importance only to that of irrigation. Such transportation will, however, soon be listed among the dim recollections of things that were, or that might have been, unless prompt measures shall be taken to restrain the flood-borne detritus from the hills, now laid bare by the hoof of the sheep and by fire. As a sufficient warning of the most practical description, one need only point to the ruined navigation of the Sacramento River, and to the buried farms lining the course of that stream, which were, not so many years ago, the pride of northern California. The whole of that melancholy and calamitous work is the result of causes strictly analogous to the denudation which has made such progress on the sierras that slope toward the valley of the San Joaquin, and which has already had the most injurious effects on the navigation of the river of that name. There is one stretch of thirteen miles where the detritus from the mountains has during the last few years formed bars that divert the water into sloughs leading off from the main channel. On this stretch boats drawing six feet of water had formerly no difficulty in navigating. I am informed by a letter of Mr. H. J. Corcoran, of Stockton (who represents the river navigation interests), that the channel has now a maximum depth of thirteen inches. It is perhaps needless to add that Mr. Corcoran "is in every case in favor of the preservation of the forests."

In the case of the Sacramento River the National Government has interfered to prevent further destruction; but before the interference the damage had reached such an extent that if a practicable remedy be at all applicable it will be attained only by the means of heavy pecuniary expenditure. It is not too late to save the San Joaquin. Little money will be needed for the undoing of the mischief already wrought. And for the future there need be no fear if the plain, common-sense method of precaution be adopted,—the method of maintaining at every point the only means—to wit, forest vegetation—by which the mountains can be prevented from becoming the worst foe, instead of the best friend, of the inhabitants of the valley.

After nearly six continuous years spent in the Sierra, the writer entertains not a shadow of doubt of the truth of what is said by Mr. Emil Newman, of Porterville, Tulare County:

I, for one, believe that the reservation of forest lands in the mountains, and intelligent legislation in regard to the preservation of the forests, are absolutely necessary in order to prevent this valley from reverting to desert conditions.

George G. Mackenzie.

## IN LIGHTER VEIN.

### With a Rosebud.

THIS fair rosebud, Elsie, see,  
 Gathered by my hand for thee,  
 While the morning yet was new,  
 And its leaves all wet with dew.  
 It may die—but if for thee,  
 Who would not the rosebud be?  
 Shall I tell thee to my thought  
 Whom its fresh young beauty brought?—  
 Conscious that in turn to thee  
 It can bring no thought of me.  
 By this token know, young maid,  
 Rosebuds are not all that fade.  
 Wouldst thou quite believe, if told,  
 That I was not always old?  
 Yet the floweret prithee take;  
 Wear it for the giver's sake.  
 Though it breathe to thee in sooth,  
 But of beauty, now, and youth,  
 When it fades into the sear,  
 It may then suggest me, dear.

*Charles Henry Webb.*

### To an Old Guitar. 1892.

HER slender fingers, jewel-drest,  
 Stole softly to and fro,  
 And in and out among the strings,  
 To tunes of long ago.

The golden ribbon kissed her throat  
 Where fain his lips would be—  
 Oh, how he loved her very breath,  
 His sweet maid Marjorie!

In velvet drest, with silken hose,  
 And jewels not a few,  
 Ah, what a cavalier was he,  
 In seventeen-ninety-two!

My songs are not so quaintly sweet  
 As those she sang to him,  
 My love and I no picture make  
 Like theirs, with time grown dim.

But music lingers still in thee,  
 And love is just as strong,  
 As when sweet Marjorie was young  
 And tuned thee to her song.

My love and I will pass away  
 Some day, and then will be  
 Another hand to touch thy strings,  
 And find thy melody.

Do you not wonder, old guitar,  
 Whose hand 't will be, and who  
 Will sing the sweet love-songs to him  
 Of nineteen-ninety-two?

I am not sad to think it true  
 (The present is so sweet),  
 That Joy and Sorrow must unite  
 To make thy chords complete.

For what is Sorrow, Pain, or Death  
 To us whose souls are strong!  
 Time cannot put an end to thee,  
 Dear Life, and Love, and Song!

*Annie Louise Brakenridge.*

### Grave Matters.

W'EN dis ol' man comes ter die,  
 Death is mos' unsightly.  
 Doan' yo' lay me in no room  
 Wid de pull-down curtain gloom:  
 'T ain' de place de dead should stay,  
 W'en de sperit 's gone away,  
 Off ter whar hit 's brightly.

'Struct de pa'son 'fo' he 'gins,  
 Tech de subject tritely;  
 'Ca'se hit 's gen'ly undastood  
 I hain't been so pow'ful good;  
 And fo' him ter shout and groan  
 'Bout me settin' roun' de frone,  
 'Low hit won't look rightly.

W'en de fun'al 'gins ter start,  
 Shove mah box in tightly.  
 'Member I is in de hearse;  
 Yo' am comin', but I 's firs'.  
 Ef de mo'ners grieve and mope,  
 So 's ter make de hosses lope,  
 Keep de team up sprightly.

Lowah me slowly in de grave;  
 Drap de earf down lightly.  
 Need n't linger long, and, say,  
 'Spense wid prayer 's de better way;  
 Don't keef ef nobody sings.  
 Jes ter know de chu'ch bell rings  
 'S gwine ter please me might'ly.

*Ben King.*

### Aphorisms for Men and Women.

HE who sues for a woman's favor in the guise of a slave, is apt, the suit won, to appear in his native character of savage.

MANY a woman is unhappy because she has not married the man that she loves. But often she would be infinitely unhappier if she had married him.

FRIENDSHIP frequently ripens into love; but very seldom does love react into friendship. When it does, it is permanent.

MATCHES made in Heaven frequently turn out as if they had been matches made in the other place.

MEN are never such heroes, or such fools, as in the presence of women.

MANY women wish either to tyrannize over men, or to be tyrannized over by them. Thus men, the reverse of despotic, are often constrained to be despots in order to have peace.

MANY a man's love is but gratified egotism; many a woman's love only the confirmation of her vanity.

If tenderness be passion in repose, passion must be tenderness aroused. Tenderness, indeed, is the source and sanctity of the deepest passion.

No man or woman can be all that he or she should be who has not the qualities of both sexes.

THE one thing a woman cannot forgive in a man is weakness. The one thing a man cannot forgive in a woman is strength.

ties against the stubborn resistance offered by the then reigning pseudo-classic school, whose art, with its dry conventions and pedagogic forms, had drifted so far away from nature. He advanced on his predecessors, however, by leaving behind their more romantic mannerisms, and carrying his art still farther into the domain of reality. Yet he never became commonplace or uninteresting. An artist in the true sense of the word, he imbued all that he painted with a distinct and personal charm.

We readily associate the names of Corot and Daubigny, and with reason. Notwithstanding the twenty years' seniority of the former artist, they were intimate friends, sharing many similar aspirations in art, while each still preserved his distinct individuality. Corot was more subjective, tinging his works with his own peculiar poetic fancy. Daubigny, on the other hand, gave himself up more to the impression of the moment, endeavoring to express the local qualities of form and color in all their brilliancy and freshness. He did not reach perfection of style at the beginning of his career, but through most devoted study, guided by the native strength and originality of his views; nor did this high epoch of landscape-art come hastily or accidentally, but was made possible by the united efforts of many men and minds working together during the first half of our century. Therefore, in tracing the life of Daubigny, we shall likewise be following the gradual development through which art in France passed to its crowning results. He was born at Paris on February 15, 1817. As a child he played

**A**MONG the landscape-painters of France who by strong and beautiful rendering of natural truth have in our century made their art classic, Charles-François Daubigny holds a high and distinguished place. When he came, Constable and Bonington of England, and Jules Dupré, Huet, Rousseau, Diaz, and Corot in France, had already led the van and won their first bat-

BOY'S HEAD. (FROM DAUBIGNY'S SKETCH-BOOK.)<sup>1</sup>

with pencils and paints, and painting in his case was more or less hereditary. Daubigny was a weakly baby, literally passing the first few months of his life in cotton batting; and as soon as possible he was placed "*en nourrice*" in the country at Valmondois, where he spent some years, gathering in the open fields and woods physical strength and a love of nature at the same time. The early death of his mother and the remarriage of his father left him almost entirely to his own guidance, and he never received a very thorough school education.

Thrown upon his own resources at fifteen, he made up by practical work what might be lacking in university culture, and immediately began the beloved occupation of his life. All sorts of odd jobs fell under his hand, from the painting of picture-clocks to the making of illustrations and decorations of various sorts, useful in a commercial way. At seventeen he was his own master, and was studying seriously with a view to higher art. One idea had always haunted him, to see Italy. It was the usual pilgrimage for young painters of that day. A friend, Mignan, shared this desire, and arranged to accompany him. For the accumulation of the necessary funds they made a hole in the wall of their garret, and here, sou by sou and franc by franc, gained in all sorts of work, they gradually amassed in about a year what they deemed to be sufficient. One day, at the suggestion of Daubigny, the wall was broken into, and out came some fourteen hundred francs in various kinds of coin. A few days after, with

packs on their backs, sticks in hand, and with stout boots, they started to make the journey on foot. We can imagine how the perspectives that opened must have intoxicated these ardent young souls. They passed Lyons, and entered the more tropical vegetation of the South; then between the Rhone and the Alps they marched on to enter Italy. They visited Florence, Rome, and Naples, drawing the monuments and visiting the museums as they passed, studying the marvels of that fatherland of art. Many were the material privations they suffered in order to prolong the stay, sacrifices willingly made to the love of their art; but after some eleven months, Mignan, who had left his *fiancée* behind him, began to grow homesick, and back they started. It was probably well that they did, for they had only two louis left when they reached Troyes. Old friends came on from Paris to meet them, and the remainder of the journey was a series of *fêtes*.

This Italian visit does not seem to have much affected the art of Daubigny; his works of this period are excessive in their devotion to detail, suffering, indeed, from his over-conscientiousness when before nature. He admired at this time, also, the works of Charles de Laberge, an artist who treated nature from an almost microscopic point of view. Among the studies that he brought back from Italy, when the accumulated treasures of the trip were spread out for the admiration of friends, was one of a thistle, most carefully worked out in all its details and remarkable for its truth. His friend Geffroy-Dechaume, the sculptor, remarked on seeing it: "What was the need of going to Rome to do that? You might have found it at Montmartre." Among these friends were Meis-

sonier, Daumier the celebrated caricaturist, Steinheil the designer, Trimolet, who afterward married Daubigny's sister, and others. They had arranged to live together and mutually to help one another to succeed, keeping house in the Rue des Amandiers-Popincourt. A simple life, earnest work, and joyous recreation was their program, and Daubigny was not the least gay among them. He cheerfully accepted any work Providence might choose to send him, drawings on lithographic stone, in pen and ink, bill-heads, prospectuses, and worked, too, for some time in the atelier of restorations at the Louvre, under Granet.

All of the brotherhood gave their spare time to study, and each year, in turn, one prepared a serious work for exhibition at the expense of the rest. Daubigny had made his début in the Salon of 1838 with a "View of Notre Dame and the Isle St. Louis," and when his

turn again came he wished to do something of more importance. He painted "St. Jerome in the Desert," and sent it to the Salon of 1840. The landscape of this composition is a souvenir of the mountains of Isère; amid the rugged hills, under an evening sky, St. Jerome is seen kneeling in prayer. There is a flavor of Poussin and Salvator Rosa about it, showing that Daubigny still held on to so-called classic traditions. It was at this time, his picture having been favorably received, that he thought of trying for the Prix de Rome, and with that intention entered the École des Beaux-Arts under Paul Delaroche. At the opening of the *concours* there was much hope of his getting the prize, and such probably would have been the case, had he not in his heedlessness failed to fulfil all the necessary formalities. He neglected to be present at a certain hour, going off instead to breakfast

with his friend Feuchères at Vincennes. Next day, to his chagrin, he found himself thrown out of the competition, and there was no appeal. Thus he failed to go to Rome, which seeming misfortune may have proved a blessing to the art world. He much regretted it at the time, as did Delaroché also, who said that "all might yet be repaired," and that "after this he should come to the studio without paying." The prize for landscape was given but once in four years; he soon became weary of so long a delay, and gave up the studio.

One day he went out sketching with some friends, and the real world seemed suddenly to impress him most forcibly. All the false, artificial productions of the schools seemed to vanish before the living beauties of the opening spring. Thenceforward he resolved that

He went generally by preference toward Valmondois, Auvers, or Isle-Adam, on the banks of the Oise, some twenty miles or more north of Paris. It was at the first village that he spent the early years of his life, in charge of the good Mère Bazot, his old nurse, and he always retained a deep affection for the vicinity. He immortalized Mère Bazot's cottage in one of his first etchings, "The Village Wedding," where it appears among some trees to the right, and again in one of his last Salon pictures, in 1874, painted when the good old woman had long since passed away, and the master himself was nearing the end of his journey.

After his début in 1838, and the "St. Jerome" of 1840, we find him continuously represented at the Salons, excepting those of 1842-46. He often suffered from the restrictions of

ENGRAVED BY A. WALCEYER.

LANDSCAPE AND RABBITS. (FROM DAUBIGNY'S SKETCH-BOOK.)

Nature, and she alone, should be his guide. He wished to spend all his time with her, and setting up his easel under the open sky, exploring by-paths and glens, riversides, woods, and meadows, to paint all that charmed him. But, marrying about this time, family cares and necessities engrossed much of his attention, and he was obliged to redouble his energies in order to cope with them. A less strong character would have sunk under duties that only added force to a nature so well tempered as his. Rarely a volume passed from the principal publishers of Paris that did not contain illustrations from his hand. He worked steadily both day and evening, often burning the midnight oil, and when the week's work was done he would start off in the night with his friend Geffroy-Dechaume, so that all the next day might be spent amid the delights of the open country.

the Academic jury, as did his contemporaries Millet, Rousseau, Corot, and others; but he bore his reverses bravely, almost gaily, and, assuring his daily bread by constant practical work, went cheerfully on. About the year 1848 a little inheritance fell to him, and he was able to take a trip into the Dauphiné and Morvan, whence he brought back a number of interesting and delicate studies, six of which he exhibited in the Salon of 1848, and was awarded a second medal. Thus encouraged, from this period he begins to take an important position. At the Salon of 1850-51 he exhibited "The Washerwomen of the River Oullins," "The Willows," "Boat on the River Oise," and "The Vintage," all of which created a veritable sensation among artists and connoisseurs. Daubigny was now a declared master. The following year brought forth "The Har-

vest," which also received much applause for its vigorous composition and effect. The busy movement of harvest, the wheat-fields, the reapers, the binders, the carrying in and building of stacks, were all given with a powerful outdoor feeling and brilliant quality. Here and there the painter had increased its vigor by laying on color broadly with the palette-knife, and some critics of the day thought the draw-

silence, and the valley, welcoming you as its guest, takes up again under your very eye its mysterious work. It is this effect, these colors and harmonies, that M. Daubigny has rendered in "The Lake of Gylieu." The limpidity of the water, the lightness and *finesse* of the sky, the freshness of the air, are indescribable. One breathes in this picture while looking at it, and there escapes I know not what intoxicating aroma of wet foliage. The truth of the second picture,

WOMEN IN THE FIELD. (FROM DAUBIGNY'S SKETCH-BOOK.)

ing of details rather sacrificed to the unity of impression, which latter quality Daubigny always considered, and properly too, of primary importance. The following year "The Lake of Gylieu," "The Valley of Optevoz," and the "Entry of the Village" satisfied the most exacting, and gained their author a first-class medal. The impression produced by these works is perhaps best given in the following description by Count Clément de Ris, a critic of the time:

Have you not had it happen to you, in your explorations as a tourist, to see opening before you, under your very feet, a break in the ground, a little valley, calm in repose, and full of elegant and tranquil forms of discreet, harmonious colors, of shadows and softened lights, bordered by hillsides with advancing and retiring crests, and where no step seems to have troubled the poetic silence? A lake, placed there like a mirror, reflects its image, and carries on its brink sheaves of rushes, coltsfoot, reeds, water-strawberries, white and yellow lilies, among which swarm a humming world of gnats and insects. At your approach some stork occupied in arranging its plumage flies off snapping its beak; a snipe runs away piping its little cry; then all falls again into

"The Valley of Optevoz," is felt even more. The eye rests on every part with pleasure, and floats undecided between the sapphire of the sky and the velvet of the vegetation. One seems to smell the clover and hay, to hear the hum of the insects, and catch the sparkling of the light over the wheat-fields.

Amid the mass of work exhibited by the official masters of the day at the Universal Exposition of 1855, the pictures of Daubigny were somewhat pushed out of place, but among them was "The Sluice of Optevoz," afterward at the Luxembourg, having been bought by the Government. The jury, too, does not seem to have been very generous, awarding him only a third-class medal. "The Springtime," and "The Valley of Optevoz," exhibited in the Salon of 1857, marked the highest degree of perfection he had yet attained, and gained him a first-class medal for the second time. Any one who has seen "The Springtime," formerly in the Luxembourg and now at the Louvre, must appreciate its merit. Under a sky where the light, vaporous clouds of spring relieve themselves on delicate atmospheric azure spreads out a fresh, green landscape. The ground rises gently

DRAWN BY HORACE BRADLEY.

DAUBIGNY'S STUDIO-BOAT AT AUVERS.

to the right, covered with growing wheat-fields, while to the left an orchard in full bloom relieves its pink blossoms against a woody grove, and, higher still, against the sky. Birds sing their songs of joy from the topmost branches, and everything expresses the season when nature is budding into the fullness of new life. Near the foreground, on a path leading through the fields, comes a peasant woman seated on a donkey, while farther back two lovers are seen almost hidden by the grain. Both in sentiment and execution this picture is all that one could desire, filled with a fresh poetic beauty, vigorously and frankly expressed. In it the real and the ideal unite under the sure and delicate hand of a master, and one feels that this is great and classic art, which can well stand by the side of any works the past has given us. "The Valley of Optevoz" was also a landscape of noble quali-

ties, and was bought by the Emperor Napoleon III. At the Salon of 1859 were seen "The Graves of Villerville" and "The Banks of the Oise," both of which had a great success, the latter picture being especially desired by connoisseurs; but it was already possessed by a M. Nadar, who afterward sold it to the museum of Bordeaux. On July 15 of the same year Daubigny was named Chevalier of the Legion of Honor, and the state favored him with two important decorative orders for the palace of the Louvre; two panels, "Deer" and "Hérons," for the Department of State, and in the following year with "The Ancient Pavilion of Flora" and the "Grand Basin of the Tuileries Gardens" for the staircase of the same department.

The success of "The Banks of the Oise" caused him to reproduce the subject several times, and as a demand seemed to grow for

DRAWN BY HORACE BRADLEY.

UTENSILS USED BY DAUBIGNY ON HIS STUDIO-BOAT.

subjects of a like kind, with which his temperament was fully in sympathy, Daubigny prepared himself to satisfy it. He wished to be free from following on foot the banks of rivers, to be independent of hotels, to be on hand at sunrise and sunset, when the effects were most enchanting, and to move about stream at will. With

material cares, living close to nature, he produced those marvelous studies of river life by which he is perhaps most widely known. Besides the accomplishment of much serious work, there was a gay and amusing side to these voyages, which Daubigny noted in a series of etchings in memory of the *Botin*, done first to amuse

Daubigny

DAUBIGNY AT WORK IN HIS STUDIO-BOAT.

this desire he went to see his friend Baillet the boat-builder at Asnières, and explained his project. "Hold!" said Baillet, "I have just what you want, a boat intended to be used for a ferry." Daubigny, who was accompanied by his son Karl, looked over the boat, which was some twenty-eight feet long, six feet beam, flat-bottomed, and drew only eighteen inches of water. Baillet agreed to complete it, so that three or six rowers could be used, and a sail at will. At the stern was to be placed a cabin in pine sufficiently large to work and sleep in, with lockers on each side to contain bedding, cooking-utensils, provisions, and artist's materials. Thus equipped, with a plentiful supply of provisions on board, and accompanied by his son Karl, other pupils, or a chance friend, Daubigny made extensive voyages on the *Botin*—for so was this curious little craft christened by an impudent rustic—along the Oise, Seine, Marne, and adjoining rivers. Here, freed from

his family and friends, and afterward published. Often did the rustics at the villages where they stopped take them for gipsies, fortune-tellers, or quack-doctors; but they were not long in gaining the good will of these country-people, who had never before seen a like craft or crew. Corot was the "Grand Admiral Honoraire," but took no part in the voyages. Yet the gay old "*père*" was often present at the starting-out dinners and on the completion of a trip, when good things both in art and edibles were plentiful, and his joyous nature had full play. An intimate and familiar friend, he designed the decorations of Daubigny's studio when the latter built his country-house at Auvers, about the time that the *Botin* made her appearance. Oudinot, who was the architect, also assisted in the decoration, reproducing a lovely Italian scene, after Corot's "*Maquette*," along the largest side of the studio, while Daubigny and his son Karl laid in the studies at each end.

These prove how extremely decorative and poetic Corot's designs appear on a large scale. The "Villa des Vallées," as it was named, is still preserved carefully by the widows of Daubigny and his son Karl,<sup>1</sup> two most amiable ladies, and is a worthy monument to the spirit of the builder. Out in the garden, drawn up under the apple-trees, and overrun with grass and vines, rests the *Botin*, now serving as a sort of summer-house, and sadly recalling in its loneliness the departed masters. For several years the writer has lived near by, and one summer occupied the larger studio, thus becoming a more careful student of the genius of Daubigny. Many and famous were the guests of this hospitable house in the old days; Millet and Rousseau were among the number. One likes to think of these men, simple in habit, but great in thought and deed, meeting around a common board and discussing the burning questions of the art-world of their day.

Here, too, removed from the interruptions and feverish life of Paris, in the heart of a picturesque country to which he was bound by

door interpretation. "The Sheepfold" and the "Moonrise" of the Salon of 1861 were the first examples of this new departure, and although they possessed much poetic feeling, the public, who had been used to the more vigorous interpretations of his brush, could not recognize their old favorite in the more hesitating technic consequent on a change of style. He soon regained his place in their hearts, however, by such works as "The Morning" and "The Banks of the Oise at Auvers" in the Salon of 1863, "The Château and Park of St. Cloud" in 1865, "The Banks of the Oise, near Bonneville," of 1866, "The Meadows of the Graves at Villerville" in 1870, the pictures called "Moonrise" of 1865 and 1868, and "The Pond in the Morvan" of 1869. Several of these pictures were reëxhibited at the Universal Exposition of 1867, gaining their author another first-class medal. At the Universal Exposition of Vienna, in 1873, Daubigny did much to sustain the honor of French art by such works as the "Moonrise" from the Salon of 1868, and "The Beach of Villerville at Sunset," in which

A BARGE. (FROM DAUBIGNY'S SKETCH-BOOK.)

associations reaching back to his infancy, Daubigny felt able to attempt the production of several works that he had for a long time meditated. Having succeeded in painting effects that would, as it were, wait to be painted, noting down living truths in the daylight and the fresh open air, he wished to record his impressions of those most beautiful but more delicate effects which last for so short a time that their realization must be the result of careful thought and patient creative labor, rather than of direct out-

both deep sentiment and great science unite. The first-named marks perhaps the highest point he ever reached in rendering the mysterious poetry of twilight, the hour when the moon takes the throne of the heavens, and tired man and beast go to their well-earned rest.

These works gained him a promotion to the grade of Officer of the Legion of Honor. Then came "The Fields in June," full of brilliant scarlet poppies, and "The House of Mère Bazot," his old nurse, in 1874.

<sup>1</sup> Charles-Pierre Daubigny, called Karl to distinguish him from his father, was born in 1846. Always at his father's side, he soon developed a taste for painting, which in the strong art-atmosphere in which he grew up was not long in becoming skill. To the Salon of 1863 he sent two landscapes done at Auvers. He was then only seventeen, but this precocious success did not prevent his continuing to study assiduously. Not wishing to follow exactly in the same line with his father, he felt that it would be best to attempt subjects where figures would have the chief interest, and, always having possessed a taste for the sea, he spent several seasons along the Brittany and Normandy coasts. "The Winnowers of Kéry-Finistère" in the Salon of 1868 gained

him a medal. "The Plateau of Belle-Croix, Forest of Fontainebleau," gained him yet another, and is now owned by the museum of Bordeaux. He was then only twenty-two years old. He continued his work, constantly striving to improve, and every succeeding Salon found him in the line of progress. Fishing-life, and the rustic surroundings of Auvers, mostly occupied his brush, and he had attained an eminent position when a rapid consumption, the result of a boat accident, suddenly carried him off in 1886, at the age of forty. Several of his works were bought by the Government, and were placed in the national museums. The future would in all probability have brought him still greater successes.

"THE CLIFFS AT VILLERVILLE."

ENGRAVED BY E. KINGSLEY.

It was at this time that the master's health began to fail. Exposure to all sorts of weather, absorbing the miasmatic vapors of morning and evening on the rivers, had no doubt told severely upon his sensitive and delicate temperament, and renewed attacks of asthmatic gout cut seriously into his painting time. He did not appear at the Salon of 1875; it was his first absence since 1848. In 1876, however, he sent "The Orchard," an immense canvas, some ten feet in length, depicting the time when apples are ripe, and are gathered under the changeful sky of breezy October. The whole effect was that of a "symphony in green," relieved here and there by the richly colored fruit, and touches of flowers among the grasses. The summer of 1876 was spent on the Normandy coast at Dieppe, and he there made a number of studies, among them a "View of Dieppe," which appeared in the Salon of 1877. With it he sent another "Moonrise," contrasting in its tender poetry with the vigor of the first-named picture, which he had completed in two sittings, one for the drawing and another for the painting. His malady gained fast upon him, however, and a hypertrophy of the heart suddenly carried him off on February 19, 1878, just as he had completed the sixty-first year of his age.

We have not spoken of his etchings and illustrations. He was one of the revivers of the former art, and the many powerful plates that he left testify to his power with the needle, both as a means of expressing new ideas, or in re-

producing his best work. Whether on copper or canvas, he always treated his subject in the same broad, masterly manner, keeping the means subservient to the end pursued, and no artist has left work showing wider range or versatility. His works record the beauty of his own country, for while he visited Italy in his youth, England in 1866 and 1870, Spain in company with Henri Regnault in 1868, and Holland, which he describes "as blond as the women of Rubens," in 1871, he does not seem to have found in these places the inspiration for his greatest pictures.

In appearance he was of medium height, his complexion inclining toward olive, with dark hair and eyes, a strongly set head and forehead, well filled in his reflective and perceptive portions, and of an open, sympathetic expression, indicating much *bonhomie*, and at the same time great penetration and power to discriminate. In manner he was genial, modest, and entirely without assumption, giving his counsels more as a comrade than as a master; his advice having weight from its intrinsic worth, rather than from any manner of imparting it. His whole nature was childlike in its impulsive directness. He never kept systematic account of his works or progress: it was his to do the work; others might reckon up and classify. His methods were extremely simple. He usually prepared his own canvases, and continued this practice long after a world-wide reputation would make it appear

to be anything but an economical use of his time. He would begin a picture by sketching in a few broad traits with charcoal or brush, and then lay in his masses freely, keeping the colors from the start clear, rich, and pure. The palette-knife played an important part in covering large surfaces, which he afterward worked into form and detail with the brush. For smaller pictures and his river studies he preferred panels of oak and mahogany, first coated with a priming of neutral gray. He was one of the first painters to begin and complete large canvases out of doors. He would fasten them in place with stout stakes, working with fury when the effect was propitious, often leaving them in the open fields during the intervals to the mercy of wind, weather, cows, and small boys. The truths he sought were of far more vital importance than surface polish, and this direct outdoor work, guided by his artist's instinct, gave to his pictures great freshness of execution, as well as an added interest from the point of view of composition and sentiment.

He painted as freely as a bird sings. His joyous, emotional temperament rarely looked at life and art with the deep melancholy view of Millet. Perhaps we find more of the joy of springtime in his earlier works, and later on come the "moonrises" and "twilights," when life's cares had awakened in his heart a deeper sympathy with the tender mysteries of eve and night. He never philosophized much about art or reduced his ideas to literary form. A lack of early education had left him ignorant of books in general, and his work gave him but little time to study them afterward, had he so desired. This, however, may have made him more purely a painter, thinking always in form and color, free from any foreign preoccupation whatever, content to express the joy he felt in nature just as he received it. "What does it matter?" he would say. "There are always people who are paid to know all one has need of, without counting the dictionaries." And so he did not stop painting to read. Particularly did he enjoy the society of his chosen comrades, and no social pleasure could compare with a quiet evening at home, or with friends, discussing art. He loved his house and home, and was his children's best playmate. Seldom was the table without guests, and here his kindly humor made every one feel happy. Whether at the Emperor's reception or in a laborer's cottage, a like politeness was extended to all, and the peasants of Auvers remember him with respect and affection. They might not fully have understood his pictures or their importance to the art-world, but they felt his fine personality and genuine interest in their life and work. When he was painting "The Island of the Valleys at Auvers," just after having con-

cluded the purchase of the property on which he built his studio, he amused himself by telling them, "This picture is to pay for my house," and it was sold for thirty-five thousand francs. If a French peasant understands anything it is the value of a sou, and this immense amount to the rustic minds gave them forever afterward great respect for painters and painting.

"Ah," said to me Ferdinand Guilpin, his old gardener, "he was a good, kind man, M. Daubigny; the goodness of such people cannot be told. And M. Corot, too, he used to put on his blouse, light his pipe, and sit down to paint in the middle of the road like any workman. He had a merry word for all who passed, and was a rare good fellow. Those were the times when 'les vallées' were full of life. Monsieur Daubigny would go off on the plain in the early morning, work an hour or two, and then start for the river. Sometimes he would come to draw my donkey, or have some rabbits let loose in the kitchen here to sketch from. I always attended to his garden, in which he was very much interested, and it was a great loss to me when he died. Such times will never come again." Then *Mère Sophie*, his good wife, chimed in: "And don't I remember how we took the Prussians in here during the war to keep them from spoiling M. Daubigny's house. I had the keys, and knew he would not like the place being ransacked, so I stowed them all away here. It was only for a few days, but when monsieur came he made me a very handsome present; and M. Karl, poor child, who was in the National Guard during the siege of Paris, when at last he was dismissed from service, ran straight across the country here, in the night, without stopping. I was out in the yard in the early morning, and when he arrived he called out, '*Jardinière, jardinière*, some milk, give me some milk!' He was terribly thin and worn, and I thought he would never stop drinking. Then he went into the house, threw himself on a bed just as he was, and slept for twenty-four hours."

And so the old folks, seated at each side of the big open fireplace on a Sunday afternoon, when Ferdinand has lighted his pipe after having shaved, will gossip on, lingering with regret over the eventful days of the past.

Daubigny never hesitated if his impulses carried him toward new experiments. He boldly undertook them, regardless of profit or loss. When death came it found him still occupied with new problems, and several large unfinished canvases make one regret that the master's hand should have been stayed so soon. But as he himself said, "One is never reasonable; like La Fontaine's wood-cutter, we never wish to be making the last fagot." In his frank, contemporaneous way of working he seemed to

ENGRAVED BY E. KINGSLEY.

“THE SETTING SUN.”

BY PERMISSION OF F. L. AMES.

have set himself free from all schools and influences, yet the early lessons learned from Poussin, Ruysdael, Claude Lorrain, and during his visit to Italy, always remained with him, and gave an elevation and largeness to his own fine, innate sense of composition. Perhaps no landscapist ever enjoyed the velvety richness of vegetation more than he, and he never failed to carry his greens up to the key of nature. A less refined painter would have gone beyond, into crudity; but while attempting the greatest possible brilliancy, he always stopped at the right place. Nature, seen through his eye, was never crude; and after all, is it not the eye that determines all differences of quality in painting? There is no absolute truth; we each see and do as our organization permits, and a universal standard of judgment decides what is best.

Daubigny brought into landscape-art greater freshness and spontaneity than had yet been seen, and his work first seizes you by its force, and then charms you. As poems of nature thrown off in the heat of passion and feeling, so his works affect you, and continue to do so the more they are studied. "He painted better than he knew" when with palette-knife and brush he dashed in effects instantaneously, and one wonders how so much can be expressed by such slight means. He was among the first "impressionists," and "realism" was one of his mottos, but how different his art from that too often called by these names to-day. It was not the coarse materiality, the surface qualities, and the bare optical effect alone that he sought to render. He penetrated deeper, and the surface was always the outgrowth and expression of a spiritual center. The thing and the thought, the spirit and the matter, were equally balanced, and never did he put a touch of color to canvases that had not first passed, no matter how rapidly, through his own spiritual self. His interpretation of nature was direct, and he sought to obtain scientific truth; but art, too, for him was expression, never mere reasonless imitation alone. A presiding intelligence, and still farther back an impulse of soul, directed the production of all his works. He found his ideal in the real, and set to work to record it. Thus each work was the result of a fresh emotion, expressed in its own way; and if you see fifty pictures by Daubigny you will find each different in conception, color, and execution, as the motive itself differs. The great amount of illustrating done in his earlier days had much humanized his art, and he dropped in figures and animals here and there most happily, not always drawn with academic precision, but full of life and movement, taking their proper place in the effect of the whole. There are drawings by him that show he could refine as well as any when he chose; but he valued life and move-

ment more than photographic precision, and these he always obtained. There was a rude vigor in his technic, tempered by great delicacy in the perception of tones and tints, that adds interest by its very antithesis. He did not reach results by feeling after them so much as by grasping his subject firmly and by painting it at once. His entire freedom from false pride and personal vanity is vividly shown in the following anecdotes:

"Come," said he one day to a friend, "I am going to paint the *Botin*." The friend followed to see the production, as he thought, of another masterly sketch, and was much surprised, on arriving at the river, to see Daubigny arm himself with brush and paint-pot and lay in vigorously on the side of his beloved boat. It had not occurred to him, with his usual habit of self-help, that the village house-painter's time would be less valuable. At another time, in July, 1874, just after his promotion to the grade of Officer of the Legion of Honor, he had come up to Paris to pay the usual visit to the Minister of Fine Arts. Returning to his home on the Boulevard Clichy, in full dress of black with white necktie, he was met by Vollon, who demanded:

"What are you doing here, with the thermometer at ninety in the shade?"

"A duty visit; but I am off again to-morrow," replied Daubigny.

"Then you are alone?"

"Yes."

"Come to dinner at my house."

"Willingly," and arm in arm they walked over to Vollon's.

"But, now I come to think of it," said Vollon, "my wife is also in the country, so we must turn housekeepers, and prepare our dinner."

Off they went to the baker's, grocer's, wine-merchant's, and roasting-shop, soon reappearing, Daubigny with a loaf of bread under one arm, a bottle of wine under the other, and with papers of pepper and salt sticking out of each pocket, while Vollon, with a view to saving the new officer's broadcloth, took charge of the turkey and other fatty purchases.

Some extracts from letters to his friend Henriet also give clear glimpses of the inner man. In 1860 he writes:

I have bought at Auvers thirty perches of land, all covered with beans, on which I shall plant some legs of mutton when you come to see me. They are building me a studio there, some eight by six meters, with several rooms around it, which will serve me, I hope, next spring. The *Père Corot* has found Auvers very fine, and has engaged me to fix myself there for a part of the year, wishing to make rustic landscapes with figures. I shall be truly well off there, in the midst of a good little farming country, where the ploughs do not yet go by steam.

ENGRAVED BY E. KINGSLEY.

“A FLOCK OF SHEEP.”

BY PERMISSION OF HON. G. A. DRUMMOND.

Again, in 1872, he writes after his return from a visit to Cauterets, taken in the interest of his health.

I was not able to work in the several excursions and ascensions made in the neighborhood, where it was very beautiful. One is so surprised by these grand aspects that it would be necessary to remain a long time before finding the interpretation capable of rendering them. I am going to finish the season at Auvers. There is nothing like one's natural every-day surroundings where one really takes pleasure. The pictures we do then feel the effect of our home-life, and the sweet sensations we experience in it.

Thus the fields and orchards amid which he opened his life were alike the inspiration of his noblest works, and the peaceful accompaniments of its close. He had spoken

of being laid away at Auvers, but it was especially desired that he should go to Père-la-Chaise. The services were held at the church of Notre Dame de Lorette, February 21, 1878, amid a large following of his friends, pupils, and admirers. Geffroy-Dechaume, Steinheil, Laville, and Vollon were pall-bearers. In finishing his discourse at the cemetery, the Marquis de Chennevières, Director of Fine Arts, said, after referring to Daubigny's forerunners: "Of those whom I have named, Daubigny came the last, but was neither the least convinced, the least in love with nature, nor the least sincere."

Brilliant technicians have been and are plentiful in French art, but the intellectual power and the original force of such a painter as Daubigny are qualities that cannot be transferred, and no one has since filled the place his death left vacant.

RAVEN WHICH HUNG IN DAUBIGNY'S STUDIO.

## OUTBOUND.

A LONELY sail in the vast sea-room,  
I have put out for the port of gloom.

The voyage is far on the trackless tide,  
The watch is long, and the seas are wide.

The headlands blue in the sinking day  
Kiss me a hand on the outward way.

The fading gulls, as they dip and veer,  
Lift me a voice that is good to hear.

The great winds come, and the heaving sea,  
The restless mother, is calling me.

The cry of her heart is lone and wild,  
Searching the night for her wandered child.

Beautiful, weariless mother of mine,  
In the drift of doom I am here, I am thine.

Beyond the fathom of hope or fear,  
From bourn to bourn of the dusk I steer,

Swept on in the wake of the stars, in the stream  
Of a roving tide, from dream to dream.

*Bliss Carman.*

## CHARACTERISTICS.

BY S. WEIR MITCHELL, M. D., AUTHOR OF "IN WAR TIME," ETC.

XIX.

T. CLAIR'S tea was postponed, and as the weeks ran by I often saw Miss Leigh at Mrs. Vincent's, and now and then at her own house. No more was said by me as to her plans. I less and less liked the subject, and when she approached it I merely put the matter aside, saying that it was too late to consider it this year because the college courses were half over, and would she let it rest for a time? But at last Mrs. Leigh, who was irrepressible, urged me to speak again to her daughter, and, seeing that it was as well to make an end of it, I put her off until I could talk once more with Mrs. Vincent.

I learned, of course, that Miss Leigh's plan for a fresh departure in life had become widely known through her mother's freedom of talk, and I did what I could to contradict the gossip. Yet, somehow, the thing haunted me. I seemed to see this handsome, high-minded girl with her exquisite neatness and delicacies of sentiment and manner amidst the scenes and work which belong to the life of the student of medicine. And was I not also a man essentially refined and sensitive? Had it hurt me? I knew it had not. But it is terribly true that a man may do and be that which is for him inconsistent with his ideal of the highest type of womanhood. He may puzzle himself mad with the logic of the thing, and be beaten utterly by its poetry.

At last I found leisure to see Mrs. Vincent. "Do not forget St. Clair's tea," she said; "and come early. It will be amusing. I really made him do it. And the Leighs. Mrs. Leigh told me of your talk. Do you like her?"

"Yes and no. May I speak? She did seem to me hard and—"

"Oh, only in talk. If one has any real trouble, she is angelic. She likes you. But, then, she likes success, as I do. Yes, strange as it may seem to you, she would make an admirable mother-in-law."

"I should be pitiful of the man," said I.

"No. If he were morally weak she would rule him for his good, because in all worldly

ways, and in business matters, no one is more shrewd; and if he were a man of eminence and force, she would give up once for all. She has no real fight in her, none at all."

I smiled.

"Oh, you may laugh."

"I only smiled."

"Yes, I know." And she set her large eyes on me watchfully. "Now, suppose by any chance our friend St. Clair were to lose his heart to my friend Miss Alice?"

"Impossible."

"Not at all. He comes here every day to talk about her. Now, with Alice's good sense and efficiency, and her mother's—"

"Pardon me, what?"

"Oh, her mother's desire to settle Alice, and then Alice's fortune. Now do you not see how very wise a thing it would be?"

"Are you jesting?" I said seriously.

"I? Not at all. I lent Alice his last book, and she is delighted with it. Yesterday she quoted the whole of that poem of his about the storm. If he could only hear her recite it, I—I fancy he would propose on the spot."

"May I be there to see!"

"And he is so handsome," she returned.

"The dear fellow would make any woman hopelessly wretched in a year. If I were you (if you are in earnest, which I doubt a little), I would meddle no more with this matter. I never thought you less reasonable."

"And I think I have annoyed you. Why, I cannot quite see. Am I forgiven?"

"What is there to forgive? Let us talk about the doctor matter. I told her what I thought."

"All?"

"No; not all. There are things one cannot discuss fully. But I said I did not believe it was best either for the sick or for society for women to be doctors; that, personally, women lose something of the natural charm of their sex in giving themselves either to this or to the other avocations until now in sole possession of man."

"And I am to think that you mean what you have last said?"

"Yes; most honestly."

"My own mind is hardly clear about it. At all events, it would not trouble Alice Leigh. At least, I don't think it would."

"No; nor any other woman, nor any woman doctor. They fail to realize what they have lost. The man who is sensitive to womanly ways sees it. It is worse than nursing the sick, for even nursing makes some women hard. Were you with us when we discussed the influence of avocations upon men? Their effect upon women is yet to be written."

"I think Alice will study medicine. What men think of her will in no way disturb her. What the one man thinks, or will think, may be quite another thing. I believe I could stop her short by showing her some duty as imperative. And you laughed at me, too. But women have, over and over, given their lives, and lovingly too, to reclaim a sot. Why were it not a better task to keep straight a man of genius like St. Clair? If you fail to convince her—"

"Fail! I do not mean to try. Who cares whether one pretty woman more or less studies medicine? I talked to her and to her mother because you desired it, but, really, it is of no great moment."

Mrs. Vincent was playing with a paper-knife. Now she put it down with a certain resoluteness in the small action, and returned: "Of course; that is all true, and let us drop it. What is Alice to me or to you."

There was a false ring in her phrase, and I said, "You do not mean that."

"Nor you what you said just now. I don't understand you, and we are both a trifle annoyed, and that is the reason why you must go away. And remember to be early at Mr. St. Clair's; we must make it a success."

"And the Leighs?"

"They will come; and now go and repent of your having been cross to Fred Vincent's wife."

I looked at her reproachfully.

"Oh, but you were, and you would have liked to be still more unpleasant. Good-by."

At this I did go, and, passing a florist's shop, repented in the form of a basket of lilies to my friend, and ordered a bushel of cut roses to be sent to St. Clair's on the Tuesday after.

## XX.

It was a brilliant snow-clad day near to the dusk of early twilight as I met Mrs. Vincent at the door of the studio, a little before the hour set for St. Clair's tea.

"The lilies were enough," she said; "but never, never be so bad to me again."

"Never. I promise." And we went in.

St. Clair had opened his stores of Eastern stuffs, and all the dingy chairs and lounges, the camp-stools and benches, in the molding-room were covered with brocades, priests' robes, and superb Moorish rugs and embroideries.

Two of the statues, now finished in marble, were uncovered, but not that of the Roman lady striking with the *cestus*. Around this St. Clair had wrapped a vast sheet of worn purple silk heavy with gold fleurs-de-lis. I knew that he was proud of this work, and I wondered a little why it was hidden, but checked myself as I was about to speak. Whether Mrs. Vincent noticed it I did not know. Few things escaped her, but she too said nothing.

"Well," exclaimed St. Clair, "do you like it all? Is n't it pretty? And these flowers? Who sent them? And what shall we do with them?"

"That is easy," cried Mrs. Vincent, and began to throw them on to the white marble bases of the statues, and upon the chairs, and around the tent of heavy crimson stuffs, within which St. Clair's athletic figure of Saul leaned in profound dejection against the tent-pole. On the inner walls of the tent, which filled all the end of the studio, were Eastern weapons and spears, swords and shields, of which he had a curious collection. When we had finished, St. Clair drew the folds of the tent together, and Clayborne and Vincent presently came in.

"And you really have come," said St. Clair.

"I?" said Clayborne. "Tea unlimited, and Mrs. Vincent? Of course I came."

"Why did you not uncover the Roman lady?" I said, in an aside to the sculptor.

"I do not know. I did not."

"It is not the nude that troubled you?"

"Oh, no! We come to be utterly indifferent as to that even in the living, and wonder at the feelings of others about it."

"Then why was it?"

"Would you uncover it? You may."

"No."

"And why not?"

"I do not know."

Then his guests began to drop in, men and women, society folks, for every one liked him, and no one took his social failings very seriously. There were half a dozen artists too, and by and by, to my amusement, Mrs. Leigh and her daughter. What Mrs. Vincent had said to the elder woman I never knew, but she was exceedingly affable to her host. She put up her eye-glasses, and with a glance at St. Clair, who was faultlessly dressed, began to admire everything and to be largely gracious to everybody. As to St. Clair, he was at his best. His Huguenot blood had long since lost the gravity it brought out of persecution, and there were only the French grace and ease along with the individualized charm which made him always a delightful companion.

Vincent and I, of course, did our best, and a happy company wandered about and appropriated the roses, drank St. Clair's Russian tea

and Turkish coffee out of tiny cups, and chattered around the statues, or recognized medallions of familiar faces.

Mrs. Leigh soon fell to my share. "Show me the things," she said. "I had no idea of Mr. St. Clair's force as a sculptor, and yet I remember De Visne in Paris spoke of him with great respect, oh, even with enthusiasm. And what lovely stuffs! Is n't he rich?"

I glanced at the woman. "No; he is as wasteful as a boy. He could easily make money. He does not care to."

"What a pity. He needs some strong, sensible woman."

It appeared to me that I had heard this before.

"He is not made for Benedict, the married man." Then I repented. "It might depend upon the woman. He is a dear old fellow, and amiable past belief."

"I have great faith in the capacity of women to manage men." This, too, did not sound home-made, and as I soon learned, Mrs. Leigh liked to repeat phrases which pleased her. "And now," she said, "a chair, and a cup of tea, and some time pray talk again to Alice about that fad of hers. An old doctor has so much influence; not that you are so very old either, but, you see, as your cousin I can take liberties. Thanks. Where does the man get his tea? I must ask him."

Presently I got away, and found Miss Leigh talking with Clayborne. She was saying, "I have just finished your book on the 'Influence of the Moor on European Civilization.' We were in Spain two years ago, and now I wish I had read it earlier."

"And you liked it?" inquired Clayborne.

"Liked it? I liked it very much. I envied you the power to do it, the pleasure of the search, the joy there must be in such a review of historic or heroic lives. You must have learned Arabic and Spanish."

"Yes; that was easy enough. But I ought to tell you that my friend North says my defect is that I am not a worshiper of heroes."

"No; I saw that sometimes you were cold, when I wanted you to be warm. And Dr. North—I should scarcely take him for a worshiper of heroes. You might improve under criticism," she added, smiling.

"I will remember next time," he said with rare graciousness.

At this moment a woman asked him some absurd question about the statue beside us. I took advantage of it to call Miss Leigh's attention to a piece of embroidery, and began to wander with her to and fro.

"Tell me something," she said, "about the statues. These Greeks. What a poem the group is!"

"Yes. A Western city has ordered it for a memorial of the dead it lost in the war."

She looked at the group in silence, and said presently, "Did you know my elder brother, the one who fell at Antietam?"

"Yes; I knew him well. I may say he was of earth's best."

She made no answer. Her eyes were full; her face flushed. I said nothing, but moved quietly away to a corner as if to show her some rugs from Fez, and talked volubly until, looking up, she said, "Thank you. And now the statues. What is the one covered up?"

"It is a Roman lady. St. Clair does not uncover it."

"Why?"

"He is not pleased with it."

"But I might be. I shall ask him. Here he comes."

"No; do not. It is disagreeable."

"But I want to see it," she continued.

"You will not, must not. Pardon me."

"Must not?" And she looked at me steadily a moment. Then she turned to St. Clair. I was annoyed. I did not want her to see the sensual, cruel abandonment of the woman to the brute man's pose.

"What is your covered statue?" she said.

"A woman aping a man. A woman gladiator."

"And Dr. North does not like women to imitate men. If I want to see it, will you not show it?"

"And why not?" cried St. Clair, gaily.

"I am satisfied," she said. "I do not want to see it," and then to me, aside, "Was I very wicked?"

"No; I did not think you would persist. Be satisfied with your victory."

"I am. Be generous, and never remind me of my weakness."

"It was strength, not weakness."

"I am half sorry already. Would you have thought worse of me if I had persisted?"

"Yes."

"You are very frank."

"And you do not like that? If you had been my—my sister, I should have been annoyed with St. Clair and much more imperatively."

"You have no sister?"

"No; I am alone in the world. Come, I shall reward you. Ask St. Clair to open the tent."

"And your lordship permits that?"

"Please don't, Miss Leigh."

She regarded me with a briefly attentive glance, but said no more until we were beside the sculptor.

"I should like to see your tent," she said.

"You can ask me nothing I shall not be

glad to do," he returned. So saying, he cast back the tent-folds, as the crowd of laughing girls fell away a little.

"It is 'Saul in his Tent,' in his madness," I said.

"But, good gracious!" exclaimed Miss Primrose, "it 's a Jew!"

"And was he not a Jew?" said Miss Leigh.

"Oh, but in art! A Jew, you know. Why, the painters don't dare to make Christ a Jew."

"But they should," said Alice Leigh. "A Prince of the House of Judah. And this face is typical. And a king too. One misses 'the ruby courageous of heart.' If some one would only read us Saul."

We went on talking, not missing St. Clair.

"Hush!" said Miss Primrose, "what is that? Oh, how too delicious a surprise!" For now we

heard the sound of strange music, and St. Clair came from behind the tent in sandals and a white burnoose. Whether it was prearranged or not I do not know, as he always declined to tell. But here was the boy David, with a small, curious harp, his face all aglow under the curling brown hair. The crowd fell back surprised, and St. Clair dropped on one knee, and began to recite, or rather to chant, "Saul," with now and then a strange accompaniment from the instrument. The effect of the eager and strong young face matched well the intensity of dramatic power that he threw into the lines of that wonderful poem. As he ended, there was silence, and then he cried out merrily to Miss Leigh: "Was n't it absurd? I was miles in the desert already," and the applause was loud and long. As he spoke, I watched Miss Leigh. She regarded him with an intense interest, her face flushing. A few minutes after it was over he came back to us in his own garb.

"How good it was that you liked it," he said to Miss Leigh.

"And did I? How do you know?"

"I felt it. I saw. If you had not, I could not have done it. You could always make me do things well."

"Indeed. You do me honor. You have made me know that old friend better. But I see mama is signaling. I must go. We dine out, and never shall I venture on an afternoon tea again. It would spoil a perfect memory. Good-by."

I stood an instant as if studying the "Saul." What annoyed me? Every one went away laughing and joyous. I heard Mrs. Leigh praising it all to St. Clair. And then I went too.

## XXI.

I SAW the Leighs now and then, and heard from St. Clair that he was making a bas-relief of Miss Alice. This he told me at the Vin-

cents', where were the Leighs and Miss Primrose, whom I took in to dinner, and who was, as Vincent confided to me, the final young person selected for me by Mrs. Vincent.

"Is n't she charming?" said my hostess in a quiet aside. Her dinner was prospering, and she now found time to turn to me. "I knew you would like her."

"Like!" I said. "She is adorable. The prettiest girl I know, and so intelligent, and so—well, so full of tact." I saw in Mrs. Vincent's eyes signs of distressed failure.

"Fred has been talking. I never have a fair chance, and you are getting old, too."

"Will she be like 'the rath primrose,' etc., think you? Oh, well, I will try again, but just now De Witt is coaching her about pigeon-shooting."

"Look at St. Clair and my dear Alice. Was there ever a more charming couple? Between us, now—do not you think—really—"

"I?" I ejaculated. "Do you sincerely want to marry her to that dear fellow? And you who care for both, and know him."

"You are possessed, I think, about our poet. He wants just such a person to make him as staid as—well, as you, and I really cannot see why you are called upon to interfere."

"Dear Mrs. Vincent, did I say I would interfere? And how could I? And what is she to me? A mere acquaintance, and he my friend."

"Very true; but you can be so irritating sometimes. I fancy Mrs. Leigh is quite hurt that you have not been near them for so long. She says Alice talks less of the doctor business; but then St. Clair gives her little leisure. What between sittings, and visits, and dinners, the man has become madly delighted with society, and dance—I thought they would never stop at the last assembly."

It was all true. I rarely saw St. Clair. I asked him one day if he were writing. He said no, he was *living* poetry. After dinner I declined Vincent's cigar, and went up to join the women. I made my peace with Mrs. Leigh very easily.

"Ah," she said, "dear Alice is quite tranquil nowadays; and by the way, Doctor, we are of kin, you know, and I may ask you, entirely in confidence,—you won't consider it a liberty,—what kind of person is Mr. St. Clair? Of course he is a genius, and wears strange clothes, but not always; and occasionally does surprise one."

"He is my friend."

"Oh, of course, and that is why I ask. You see, I am alone, and have to be father and mother, and it is always well to look ahead. It may come to nothing. Are his habits good?"

"Really," I said, "you must ask some one else."

"Oh, then, you mean he is n't a man you can talk about."

"I could talk about him all night. He is to me as a brother. Ah, Mrs. Vincent," I added—"No; no coffee," and, rising, gave her my seat. "Ask Mrs. Vincent," I said, and strolled to the corner where Miss Leigh was looking over some prints.

"You are a stranger of late," she said. "And all that pleasant friendliness we began with—alas! it is squandered, as they say in the South."

"I am a busy man," I said, "and Mrs. Vincent tells me you are as busy a woman." And then, feeling cross and vicious, I added: "And what has become of those grave views of life? Is it still so unsatisfying?"

She regarded me with a trace of surprised curiosity, and then said: "No; I am as I was, and some day you will let me tell you my side. I listened pretty patiently to yours. I suppose that you men who live amidst life's most serious troubles get a little—well, stolid as to so small a thing as how a woman of your society, a mere girl, is disturbed about her days, and what to make of life, or whether just to let it alone and drift."

"And is not happiness everything, and are not you happy now?"

"Happy? That is my temperament; and what has that to do with it?"

"Indeed," I said, "I do not know."

"Then why talk so?" she added almost sharply. "I do not understand you. You seemed so fair, and now—"

"How comes on the rillievo?" I said, abruptly turning the talk.

"Oh, well enough."

"And my friend, St. Clair; is he not charming?"

"I do not know. The phrase is rather strong. He is interesting. I like him. You should have seen his face when I told him I meant to be a doctor. He looked at me a moment, and then said, Good heavens! and would I cut my hair short, and might he send for me if he were ill, and would I be expensive as a medical attendant? He was certainly very amusing, but it takes two to make a joke as well as a quarrel, and I do not like to be laughed at by a man who—" and she paused.

"Well," I said, "who—"

"In some ways I am more of a man than he. He is undecided, easily led, and expects every one to indulge him."

"I assure you that a more delightful friend no one could have."

"Friend? Yes, certainly."

I looked at her. A little flush like a faint, rosy sunset cloud was slowly moving over her cheek. A signal of something. Was it doubt, or annoyance, or what? I began to feel a re-

newed interest in the woman before me. It faded when I ceased to see her. It grew up again when we met and talked. As the idea crossed my mind that Mrs. Vincent's schemes might this time be successful I had a sense of discomfort which I did not stay to analyze, but said at once:

"Are there not men who are incomplete without women? I most honestly think that some noble-minded woman could be the complement of this man's nature. She should be one fixed as to character, resolute, tender, and absolutely conscientious. If she were beautiful, and—well, if she loved him, he would be at his best always. It would be not the poor task of saving a worthless man, but the nobler one of helping one well worth the helping."

"Ah," she laughed:

"If he be not in word and deed  
A king of nature's highest creed,  
To be the chancellor of his soul  
Were any but a happy rôle.

Some women love and learn. Some learn and, learning, love. It seems to me hard to understand how a woman could with knowledge aforethought undertake such a task. Would you?"

"Oh, I am not a woman."

"Well, it is a pretty problem. Imagine yourself that woman."

"I cannot. But men and women may marry with clear ideas of the imperfections of the being they marry, believing that to love all things are possible."

"I see. But though one might love a man with a bad temper, or morose, or despotic, one might with more doubt face the qualities which come out of lower forms of moral weakness. But how serious we are. Why not invite Susan Primrose to the post of conscience-bearer. Ah, here come the men you deserted."

St. Clair joined us, and presently I took my departure.

Mrs. Vincent detained me a moment. "Really," she said in an undertone, "I think our friend is—well, and my gentle Alice—you laughed at me about it at dinner, but now it is serious, I think, and how nice it would be. If Mrs. Leigh speaks to you, do be careful."

"She has spoken," I said.

"And of course I know what you must have said."

"Said! I referred her to you."

"Ah, indeed! She must think that odd."

"I do not see why," I answered shortly.

"But I am rather tired of the subject. I must go. Good night."

"One moment," she said. "I seem to have annoyed you; I certainly do not want to do so. I am unlucky of late. I can see no reason why

you should object to being asked questions as to your friend by Mrs. Leigh. It is plain to us all that St. Clair is in love with Miss Leigh, and what more natural than her mother's desire to know something definite as to the man."

"And how can I tell her that St. Clair, with all his fine qualities, is unfit to be a husband?"

"Then why shift the responsibility of an answer upon me?"

"Because you think otherwise. I shall tell him exactly what passed."

"Perhaps that is best. It may really be of use to him. His character—"

"Oh, confound his character! I beg pardon, I did not mean that; I was rude. I must speak out frankly to Mrs. Leigh, or not speak at all, and I prefer the latter course. I would rather not discuss it further."

"Well, as you please. Good night. You are very cross and most unreasonable."

## XXII.

I HAD never before been so vexed with Mrs. Vincent. She was apt to meddle gently with the affairs of other folks's hearts, and sometimes to retreat bewildered or dismayed at the consequences. Moreover, she was subject to acute attacks of social remorse, and suffered out of all proportion to the greatness of the crime. I must say that I am not an easy quarreler. I am troubled deeply by a cold phrase, or a hasty word, and lie awake repentant upon the rack of self-examination. Therefore it was that our two notes of self-accusation and apology crossed each other next day.

She said:

MY DEAR FRIEND: I was persistent, and perhaps—yes, I was unreasonable last night. I mean unreasonably persistent. And it may be that I am quite wrong. Fred says I am, which will perhaps comfort you. For although I hate to be wrong, I hate more to be told I am, even by Fred. I do not understand you, but that does not make me grieve less at having annoyed or hurt you. As to Alice and St. Clair, I shall never say another word, and if I were not afraid of a pledge, I would vow never to be kind to man or woman again—unless the man is the friend to whom now I excuse myself. And if it only were you.

ANNE VINCENT.

There was also a package, which was a first edition of "The Urn Burial," and inside was written "I am so sorry. 12.30 P. M. A. V."

And as for me, I had written: "I was rude last night. Pardon me."

Then, the day being Sunday, I sulked over my misdeeds, and went to see St. Clair. I found him idling in his studio before the bas-relief of Miss Leigh's head.

"Oh, come in," he said. "Jolly cold, clear

day, is n't it? Had two hours on the ice at six this morning. Is n't this a success?"

It was, and I said so shortly.

"What's the matter?" he queried of a sudden. "You look as you do when I have been in mischief. By all the gods, I have been a good boy of late. I gave Clayborne money to invest for me last week. I have n't been to a beer-garden for days. I have even paid my dinner-calls, idiotic custom. What is it?"

"Nothing. I have to say something unpleasant."

"Then get it over. I loathe suspense, as the fellow said when he was about to be hanged."

"Mrs. Leigh has asked me to give her some idea of your character. Oh, confound it! how stiff that sounds. She thinks, as we all do, that you are in love with Miss Alice, and, like a straightforward mama, says, 'Is this a good man? Will he be the husband she ought to have?'"

"Well, old man, what then?"

"Oh, simply this: Do you want to marry Miss Leigh? If so, I must go on. If not, you are doing her a wrong, and I need say no more than that."

"Is n't she noble-looking?" he replied. "Just look at that head; the color of the hair; the tranquil kindness of the face; and the proud prettiness of the neck."

"Do you love her?" I said abruptly.

"Oh, how do I know?"

"Are you really a child, St. Clair? Yes or no. How is it with you?"

Then I looked from him steadily at the medallion. I could not tell why it so touched me, but, as I looked, my eyes filled. I was puzzled at my own causeless emotion. Meanwhile, for this brief moment, he was silent, and then his face, as I turned to it, took on a look I well knew of peculiar sweetness as he said gently, "Would you like me to love her?"

"No," I said.

"And why not?" he went on, touching the clay here and there.

"Because you would make a bad husband. You would in a year break her heart. You would not want to. She is a woman resolute, proud, and firm as to her beliefs, and the duties to which they bind her. You have no creed. You are amoral, not immoral. You would hurt her all the time, and at last lose her love and— and—"

"Her respect. Do I lose yours sometimes? Yes, I know I do; and you mean that you can fail to respect me and yet cherish my friendship, but that with her love must go with respect. Is that it?"

"Yes," I said, astonished.

"And you could not, would not, tell her

mother all this, and you came to say so to me?"

"That is it."

"Am I a bad boy?"

"Oh, don't," I said. "It all hurts me. I see trouble ahead."

"And you like her. She is your friend, and so am I. I would have been a weak fool under like circumstances, and praised you through thick and thin, right or wrong. Pretty head, is n't it? Would you like a copy of it? I'll send you one."

"My dear St. Clair, what are you talking about? How can you trifle so? How do you suppose she would like that, or Mrs. Leigh?"

"Hang Mrs. Leigh."

"With all my heart; but let us have no nonsense about this matter—I mean, as to this head. As to the rest, I have done my duty as to a friend. Go on, or stop. It does not concern me. I am free of responsibility." I was vexed with his indecision, and dissatisfied with the rôle I was playing.

"And what do you advise? Now, really."

"How childish you are, St. Clair." I shrank from saying: "Give her up. You are unfit for her. Women do not resist you. You were made to please for the hour, not the year." I went on at last quickly: "If you are honestly in love, I have no more to say. Go on, and God help her and you. Perhaps he may, and time may show what a fool I have been."

"Frankly, Owen," he returned, "is it of me or of her you think?"

"Of both."

"Of whom most?"

"Oh, what matters it? I have said enough."

"Too much or too little. But do not think I am not thankful, and more thoughtful than you suppose. Let us drop it. I hear that you may go to Charleston about this yellow fever."

"Yes; I am asked to go South on a Government commission to study the outbreak they have had. I think I shall go. I saw it once before, and, for various reasons, no one else is quite as well fitted for this not over-pleasant task."

"It is risky."

"Very."

"I would n't go. What's the use?"

"It is a simple duty. I should like to go away for a while, and it fits in nicely."

"Darn duty."

I laughed, as if damning duty mended matters, and we parted.

### XXIII.

WHAT I had said was true. I was out of spirits. My work bored me, and, as has been seen, I was peevish and irritable.

The next evening I was at Mrs. Leigh's. They were alone—or rather Miss Alice was—for a time.

"Good evening," I said. "I am very busy, but I have come in just for a little talk, and to say good-by."

"Yes; Mr. St. Clair told us this morning. He thinks it quite needless—your going, I mean."

"Needless? He knows nothing at all about it. A man of experience is wanted, and I, unmarried and without ties, am of the men alone fit for it."

"But you have friends, and sometimes those ties are strong."

"Yes, very."

"And is—is the risk great? You have never had the fever. Is there no one who has had it who can go?"

"No one. And I want a change, too. At times life wearies one. You ask why, and I cannot tell. A fresh duty, an absence, winds one up, and we go on again."

"And is your life wearisome? You, who live for others, who are dear to so many, the rich, the poor. Ah, you smile, but you know we are friends, and I manage to learn all about my friends."

A sudden impulse mastered me. "If you were I, would you go?"

"Go!" she exclaimed. "Without a doubt."

"And you advise me to go?"

"I am only a girl," she replied.

"You are my friend."

"Thank you; would one say to a soldier, 'Stay at home'? Yours is a nobler calling. I do not think the world has bonds would hold you back."

"That was kindly said and true. But you overrate me,—I mean as to what you said a moment ago,—and to be overestimated always humiliates me. I shall think of what you have said, and, please God, will come home safe and happier."

"You ought to be happy. It seems strange to me that you are not. You cannot be compassed about with doubts as I am, and see duties you must not accept, or a path you may not tread."

"And are you still tormented?"

"Yes."

"And why not go on?"

"It may appear to you odd, but only one statement of yours really disturbed my resolution."

"And that?"

"The idea that—that a woman might lose in the work I look to certain of those nameless graces, those tendernesses, which seem to me so much of her honest property."

"I think so, and I have seen you often. We have come to be friends. Now, suppose that

you promise me you will not go on in this matter till I come back. I have much to say about it, and no time in which to say it. I leave to-morrow."

"To-morrow?"

"Yes; but one word more. If I never come back, of course it releases you."

"It releases me? It releases me?"

"Yes. Ah, Mrs. Leigh, good evening," I said, rising. "I came to say good-by."

"Yes; I saw it in the paper, and Mr. St. Clair told us. I suppose it is not very dangerous, and then, if it is, you are a doctor, and it is a matter of business after all. If you see the Temples, remember me to them. But they must have gone, of course."

"When do you return?" said Miss Alice, who had been watching her mother with a grave face.

"In a month, I hope."

"If you see any nice feather fans," said Mrs. Leigh, "do spend a few dollars for me. There are red ones, really charming."

"Charming? What is?" said Mrs. Vincent, entering with her husband. "We missed your call, and Fred and I have been to see you. You leave to-morrow, your note said. I do not call that charming."

"Oh, it was fans," said Mrs. Leigh. "Dr. North is to bring me some nice feather fans."

"Indeed! Bring me nothing but yourself. I am horribly troubled about you. It recalls our talk about fear. Are you ever afraid of disease?"

"I? No—yes. I have always had a slight, a vague dread of this especial malady. I think I said so. I find that physicians often have some such single pet fear."

"Like a soldier's," said Miss Leigh, glancing up at me. "That alone would make you go." Mrs. Vincent glanced at her curiously.

"We won't talk of it," said Vincent. "Write soon and as often as you can."

"Oh, not to me!" said Mrs. Leigh. "Is n't it dangerous?"

"No," I said, laughing. "And now good-by. And this day month, Miss Alice. Good night."

## XXIV.

OF my really perilous commission I have nothing to say except that it brought some empty honors, and cost my colleague a sharp attack of the fever. This detained me longer in Charleston, and I got home early in May, tired out with nursing and anxiety. I had heard often from home, but, until a week before my departure, nothing of moment. Clayborne from time to time sent me large sums to be used among the poor of the pest-stricken city. He wrote that of course it was all due to bad hy-

giene and carelessness, but that I might like to spend some of his spare cash, and thus excused in his cynical way acts of unusual generosity.

A week before my return came a letter from Mrs. Vincent.

Our friend St. Clair [she wrote] has been at his wicked worst of late. He told Fred last month that he had been gambling in stocks, and was in debt. The speculations, Fred says, were simply absurd. I asked him why he did it, and he replied that it amused him. I cannot make him out of late. I ought to say that Mr. Clayborne at once paid some thousands for him, remarking that it was so comfortable to make a fool of one's self now and then. I said that St. Clair puzzled me. He has shut up his studio, declined recklessly to complete his contracts, and really told Mrs. Leigh, to her disgust, that he could not finish the relief of Alice's face, because work bored him. I do not think he has been near the Leighs since you left. It is too annoying; I shall never try to help anybody again. I am furious at the thought of how right you were. If you bring Mrs. Leigh any fans I will never speak to you any more.

I reopen this letter to tell you an astonishing piece of news. St. Clair came in on us to-day, and would we tell him when you would be at home. Fred said, "Next week." Upon which he was so sorry, because he was to sail for Europe in four days, and gone he has. The new statue for Cleveland has to be cast in Paris. I do not believe it. At first I suspected that Alice had said "No," but this is not so, for, as I said, he has not been near her, and the last time they were here they were on pleasant terms enough. I am dying to ask Alice, but she is hardly the girl to put questions to, and, besides—however, you never appreciated her duly, and I do not want to bore you.

She told me to-day that he had called before he left (his first visit in a month) and that he did nothing but talk about you, which amused me.

Fred sends his love, and I am as always,

Your friend, A. V.

P. S. I hope that St. Clair wrote to you, but I do not believe he did. That man is capable of any virtue or any vice. Do share with me my exasperation.

This letter gave me much to think over as I gladly left the roses and jasmynes of the luckless town, and rolled away northward. I was annoyed at St. Clair for the hundredth time, but it was like being vexed with some charming, thoroughly spoiled girl, and of course I wrote to him.

Arriving late I found a note from Mrs. Leigh, which perplexed me.

She said:

I am so glad of your return, because I need you. We have had Dr. Simpson since our return, but really he has not the least respect for my

judgment, and if I do not know the constitutions of my own children, I should like to know who does or can. Alice is not at all well. She does not know I send for you, but do come soon. Of course, it is a drawback to have a single man, but then you are a relative, and no longer young. [I was just thirty-seven.] Come soon, etc.

I dropped the note as I stood; picked it up; read it again, and went at once to Mrs. Vincent's, although it was as late as 11 P. M. Mrs. Vincent had just left her husband. After we had exchanged warm greetings, I said, "Won't you ask Mrs. Vincent to come downstairs? And, Fred, let me see her alone a moment; I want a little advice."

"Really," he said, "I ought to charge for these consultations. St. Clair was at it last week. Mrs. Vincent makes a good average for all easy-tongued women by secretiveness quite exasperating."

"After the consultation," I said, "I will consider the fee."

"It ought to be large. What do you get for being rung up at midnight?"

"When you are through perhaps you will ask Mrs. Vincent if she has gone to bed."

"She has not," cried Mrs. Vincent, entering. "I heard your voice, and really, I only came down to say how glad and thankful I am. You look tired, but then—it was a fine thing to do. I was proud of you. I could not do it; my friend could, and oh, I liked—liked it well, and so did Fred. He has bored me to death about you, and now you are back, and—and I thank God."

She had my two hands while she spoke, and was a little tearful as she ended, being nothing if not enthusiastic as concerned her friends.

"I cannot weep," said Fred, "but you are very welcome."

"You men are horrid. I shall leave you."

"No; it is Fred who will go, and you will stay."

"A consultation, Anne. You will find me in the library."

"And now," said Mrs. Vincent, "this is altogether too delightful. What can I do for you? It is so pleasant to know that I can give you anything. But tell me about Charleston. No, not now; another time. What is it that I can do?"

Now that I was into this grave consultation, I began to distrust the doctor and myself. I reflected that I had not enough considered the matter; that, in short, I was a fool. As a result, I put off the fatal moment.

"Presently we will talk," I said; "but first tell me all about everybody—all my friends."

"Mr. Clayborne has been as fidgety as a fish on a bank. I think he loves you best of any one on earth—better even than Clayborne. What is your trick of capturing people?"

"How can you ask? I am your friend; you must know. And St. Clair? Of all his crazes, this is the queerest. To love a man who does everything you don't expect, and nothing that you do expect—alas! it is hard on men, and on a woman harder. But I suppose the fancy for Miss Leigh is over, or has it gone to wreck? How has it ended?"

"How cool you are," she replied; "and how easy to call it a fancy, and what has come of it. You may know as well as I."

"No, no; but I must not invite you to violate a professional confidence."

"Indeed, it is useless."

"Oh, then you do know?"

"I did not say so. And is all this because you came here to tell me something, and now repent a little?"

"Good gracious! what a woman! How is Fred?"

"Oh, very well. And if you wish to put off what you have to say, I shall go to bed at once. I am—"

"No; it may as well be now as at any time."

"Ah, that is better."

"Read that."

"Ah, Mrs. Leigh wants your advice about Alice. I am so glad. I advised her to send this very morning. You know I cannot have you myself, but I want every one else to have you, and now I shall be easy, quite easy, about Alice. It is only that she is looking pale."

"But I do not mean to go. You know I am only willing to go in consultation. I do not want practice. I—"

"But this! Oh, this is different."

"Very. And you who got me into this scrape must get me out of it. I do not know how you will do it, but you must manage it, because I do not intend to go."

"You cannot mean that?"

"Yes. Tell Mrs. Leigh that I chanced in, and that I do not take cases outside of my house. Anything you like."

"But it is not true; and after all, it is I who ask you to go, and imagine my making an excuse so ludicrous as that to a woman of the world like Mrs. Leigh. I am quite willing to do anything sane for you; but this! What is your real reason? You do have a reason for most actions."

"Oh, I don't like that quiet old woman. Surely one may choose one's patients."

"Assuredly. But write and say so. Why come to me?"

"Then I shall fall ill. I simply will not go."

"I am sorry; I am more than that—and after I took so much trouble. I am—well, just a little hurt."

"But I would not annoy you for the world."

"Well, that is a strong phrase. Why do you?"

"I cannot be Miss Leigh's physician."

"Ah, it is Alice then?"

"Yes; it is Miss Leigh. Cannot you understand?"

"I? No. What do you mean?"

"Mean! Cannot you see that I love Alice Leigh?"

"What a fool I am! Oh, you dear, delightful man! The thing I have dreamed about. And now I see it all. All. And how long has it been? And does she know?"

"I think—I am sure not. And one favor I must ask. It is that neither by word nor sign do you betray me."

"And I must not help you?"

"No."

"And as to Mrs. Leigh, you are quite too tired to see patients. You are not well. You wished to leave it to me to explain, rather than to have to say abruptly in a note that you cannot come. And that was so nice of you. But you will dine here with Alice to-morrow?"

"Indeed, I will not."

"But I must tell Fred?"

"No."

"Then good night. I hate you, and I am so glad."

When I went to see Mrs. Vincent it was only with a sense of my own difficulties, and a desire to find a way out, but with no clear idea of how it was to be done. The note had of a sudden set me face to face with a grave fact in my life. I cared deeply for a woman, and had never meant to do so again. At first this self-knowledge humiliated me, and seemed disloyal to an ideal I had loved and lost. I am sure that most deep affection is of gradual growth. I am as sure that the discovery of it as something victorious over memory, prejudices, resolutions is often sudden and surprising. It was so to me. I recoiled from the practical issue of becoming this woman's physician, and in the recoil, and in the swift self-examination which followed, I knew that I loved her.

I walked away but half pleased with myself. It was plain that I had not dealt fairly as to my friend, or perhaps with him, and yet I had meant to do so. I had had, as the Indians say, two hearts about it, or, as we say, had been half-hearted. I laughed as I thought that half a heart had been an organ incompetent to carry on the nutrition either of love or friendship.

At last I reached my home, and sat down with a counseling cigar to think it all over. Emotion had clouded my mind. Now it became more or less clear to me. St. Clair had seen through me as I had not seen through myself. My cigar went out. I relighted it. It was rank to the taste. I threw it away. It was like some other things in life.

As I rose to go to bed I turned over the let-

ters on the table. There was one from the citizens of Charleston; warm thanks for a great service—Alice Leigh would like that. Beneath it was a letter from Paris in St. Clair's well-known and careless hand. I read it as I stood:

DEAR OWEN: Sorry to have missed you. I am busy here with my new studio and the statue group for Cleveland. I want you to pay the arrears due for rent in my old den in Blank street, and have what is worth keeping stowed somewhere. My remembrances to the Leighs. I left Miss Leigh's relievo in the front room. Keep it. I am not sure that the eyes are quite correct. The upper lids drop straight, or rather in a gentle curve, from the brows; it gives a look of great purity to the upper part of the face; the peculiarity is quite rare, but is to be seen in Luini's frescos. In fact, the type is medieval. The slight forward droop of the neck is pretty, but not classically perfect as to form. Also, the head of my charming model is rather large for the shoulders, which are a trifle out of proportion to the weight of the head.

Write me soon and often. I shall not answer, but I shall intend to do so. Love to the Vincents and to the historic giant. From your friend,

VICTOR.

For a moment I stood in thought with the letter in my hand. Then I read it again with care. Had St. Clair deliberately sacrificed himself to me? Was his devotion to Alice Leigh only the expression of his adoration of an unusual type of human beauty? I had before seen brief attacks of this passionate idolatry. Had he become satisfied that marriage was a contract he could not honestly enter upon? That would have been unlike the man. I was exceedingly perplexed.

xxxv.

THE next day I called on Clayborne, but found him absent, and toward noon wrote to Mrs. Vincent that I hoped to find her alone that evening.

The enigma of last night was no clearer in the morning. A hasty note bade me feel sure that she would be at home about ten, and of course she would take care that we should not be interrupted. After that, and until I could talk to Mrs. Vincent, I resolutely put my problem in a corner, and tried to forget it. But despite my control it turned every now and then like a bad child and made faces at me, so that I had an uneasy and very restless day.

I found Mrs. Vincent alone, and quickly saw that this gracious actress was on for a large rôle, but just what was not clear to me. The room had a rather unusual look. The easy-chairs were not in their places. A crimson mass of velvet heavy with Eastern phantasies of color hung in stately folds over the far end of the grand piano. I knew it well as one of St.

Clair's wildest and most extravagant purchases, the fruitful text of sad sermons by the friend whom the naughty poet called the Rev. Dr. Clayborne. St. Clair had sent it to Mrs. Vincent the night he left—a royal gift. I glanced from it with a full heart to the roses which were everywhere in bowls and tall vases, each, as I well knew, sedulously arranged as the woman's perfect sense of harmony in color dictated. She herself was dressed with unusual splendor, a style not after her ordinary habit, which rather inclined to a certain extravagance as to stuffs, and to great simplicity in outline and forms. Also, she wore two or three jewels, and these especially flashed a warning to me as to there being some surprise in store.

As I entered, the house rang with the triumphant notes of a love-song of Schumann.

"Ah, this is good of you," she cried, rising. "And now that we shall have a nice talk, I am so happy. Did you hear how my piano was rejoicing with me?"

That was so like her, and I said as much.

"Yes," she went on, as I looked about me; "we are *en fête* to-night. And you look so grave, Owen." Once in a great while she used my first name, being, despite our extreme and long intimacy, little apt to be familiar in certain ways.

"Yes," I said; "I am as you say, because I am troubled."

As I spoke, Vincent entered. "Ah, North," he cried, "how welcome you are!" and cast a glance of faint amusement over the room and his wife's costume. "I have been away since morning, or I should have called. I met Clayborne on the steps."

The historian carried a book and a stiff bouquet, which he deposited on the table. "Here," he said, "are the essays, pretty obvious stuff, and some flowers."

Mrs. Vincent thanked him profusely. "So good of you," she said. "What lovely gardenias!" And presently she set one in her belt, saying, "A thousand thanks."

"Why not one?" laughed Vincent. "Why is that noun only plural? It ought to have a definite value—one thank. Then one could grade one's gratitude. Why not thirty-seven, or half a thank on occasions?"

"Quite true, quite true," said Clayborne. "The nouns which are only plural must be rare. Hum—" and he fell into a reverie.

"How absurd you are, Fred," remarked his wife.

"Well, the surroundings account for that. Do you entertain Haroun al Raschid to-night, Anne?"

"I entertain myself," she replied, and I detected a little ocular telegraphy meant for Vincent alone. Then Clayborne looked up.

"I can recall no other," he said. "And in French it is the same, and in Arabic. I must look it up."

"Mrs. Leigh told me to-day that you had been to see her," said Mrs. Vincent.

"Yes; we are old acquaintances. You know I was Leigh's executor. That girl must have a pretty fortune. There has been a long minority. Why did not you marry her to St. Clair?"

"I did my best," returned Mrs. Vincent, gaily. "And there is the mama. Now what could be more fitting for you?"

"I! What! Me!" cried Clayborne.

"You might let me mention it to the widow."

"Heavens!" he exclaimed, "I believe you are capable of that, or—of anything. Let us go and look at the dictionaries, Vincent. Mrs. Leigh! Ye gods of sorrow!"

"Well, think it over," cried Mrs. Vincent, delighted, as the historian rose.

"I leave you to your patient, Mrs. Vincent," said the husband. "Is the case a bad one?"

"Prognosis favorable," returned the wife, laughing and striking a few gay notes on the piano. "Diagnosis certain. Am I professionally correct, Dr. North?"

"I never interfere with other folks's cases," I said, and we were alone again.

"And now," she said, "what is it? And do look happier. Fred says I am crazy to-day, and you would not let me tell him. But what is wrong? Surely—"

"Oh, everything is wrong," I said. "I have been a fool, and I have helped to break up St. Clair's life, and I must talk about it to some one."

"Of course. And perhaps I can help you. Only women know women."

"It is not the woman, it is the man, that troubles me. To have won a possible happiness at the cost of a friend, I—I—"

"But perhaps the happiness is not possible," she answered.

"That were no better. I should be doubly punished. Do you think he loved her?"

"I do not know. St. Clair is seemingly so transparent, and then of a sudden you become aware that they are only surface reflections that reach you. There are curious depths in that man's nature. Presently, as Fred says, one is off soundings. I understand you, I think, and I am sorry for you. And now what is it?"

"Read this letter," I said.

As she read I saw a faint smile of pleased surprise gather upon her face. She re-read it. Then slowly she folded it up, gave it back to me, and took a perfect white rosebud from the jar near by, and put it on the table beside me. I took it up mechanically.

"It is sweet," she said, "and pure, and there is no canker at the core. The rose is my dear

Alice, and you may take her if you can, and without a pang."

I was accustomed to these little dramas, but this was too much for me.

"What do you mean?" I said.

"And you read that letter?"

"I did."

"Well," she said, "I never was more fully persuaded as to the depth of folly, of incapacity, one may find in a man."

"You are enigmatical."

"Am I indeed? May I show that letter to Alice?"

"What! You must indeed think me a fool."

"I shall not answer you according to your folly. And people say you are a student of character and see through women! It is past belief; but trust a woman's insight for once. Ah, certainly I am at home. Show Miss Leigh up. Here comes the answer to my enigma."

"O Mrs. Vincent! This is one of your little—"

"Hush! Is n't this joyous?" And she struck the keys again until the glad notes of the love-song rang through my brain."

"My dear Alice, how good of you to come!" she cried. "You must have left your dinner-party early. Why, it is only ten. Dr. North has just chanced in, and now we shall have a quiet talk. You have not seen Dr. North since he came back. My room is *en fête* to welcome him."

"When you give me a chance I shall tell him how glad all his friends are to see him safe back again." Her words were quite formally spoken.

"It was worth the price, such as it was," I said, "to come home and find one has been thought about." Her formality affected me, and I struck automatically the same note in reply.

"And now tell us about it," said Mrs. Vincent. "You were detained by Dr. Roy's illness?"

"Yes; I had to be nurse and physician."

"Well, I want to hear it all—everything; but pardon me a moment, and talk of something else. I must answer Susan Primrose and two invitations for Fred."

Upon which she retired to a desk in the corner, and we fell into talk. At last I said, "I did not keep my engagement. To-day month, I said when we parted, and now it is—"

"Nearly two," she replied.

"Oh, quite two," ejaculated our lady manager from the corner, rising with notes in her hand. "Excuse me, I so want to hear that I cannot write; I have made two horrid blunders, and I must ask Fred if he will dine with the Carltons. I shall be back in ten minutes," and she was gone. Then I began to understand the drama, and was instantly on guard. At the door she turned back. "Do make that man

smile a little, Alice. I found him too stupid for belief. I turn him over to you. Half an hour have I spent in trying to make him understand just the simplest thing conceivable. You may be more fortunate, or—well, more clever." And she was gone. I could have pinched her.

"And the problem, Dr. North?" said Miss Leigh.

"It was purely personal."

"And troublesome? Mrs. Vincent has left me heir to the talk."

I interrupted:

"Yes, very."

"I am sorry, and you look so tired. I can understand that one might suffer long in mind and body after what you have been through. Seriously, I do not suppose Anne Vincent would have spoken so lightly about anything that I might not talk of. You once said that we were friends. Perhaps you do not know by this time that I take life gravely, even its friendships. Can I help you as a friend?"

"No," I said, grimly.

"Then pardon me. I did not mean to be indiscreet, or—"

"You are not. You are only and always kind. But Mrs. Vincent is sometimes carried away by her moods."

"And you think we should always be responsible for our moods? I wish I were. It is so pleasant to coddle them, and I do try not to." Then her eyes fell on the crimson and gold embroidery. "Have you heard from St. Clair? He is very apropos of moods, is n't he?"

"Yes; I had a letter to-day. He is in Paris."

"I wish I had his sense of irresponsibility," she returned. "It must be so nice to have a heart and no conscience. You must miss him, or you will, I am sure. Every one must."

"Yes, I shall. I am fond of him."

"Anne says he will return in the autumn."

"I do not know."

"Do you think he knows?"

"Who can say?"

"I have been wanting so much to see you to talk again of my plans. Do you not think—"

"I don't think," I said. "I prefer not to discuss the matter. Ask some one else. I am useless."

"How short you are with me. Don't you know friends are for use?"

"I suppose so. Mine fail me at times."

"Now, do you mean?"

"Yes."

"Well, I must turn you over to Anne Vincent. I don't wonder she considers you difficult."

"You are certainly the last person to whom I should go." The situation was fast getting out of my control.

"That is the worst of friendships between men and women. Mama says they are impossible. There are so many limitations. I wish some one would write a book about friendships. There are so many about — about other things."

"Your mama is quite right," I said. "Friends should be kept in their right places, and that is not always easy. They take liberties. They — suppose I were to ask you an impertinent question?"

"I don't like the word — the adjective."

"Well, un-pertinent."

"That is better. I should try to answer it." But she glanced uneasily at the door.

"Do you care for Mr. St. Clair?"

"Care?"

"No. Love him?"

"That is a question you have no right to ask."

"I am his friend."

"Then his friend is unwise, and permit me to say —"

"Stop," I said. "Do not hurt me more than you must. What I ask profoundly concerns my life, my —"

"I would rather you said no more. I beg of you to say no more."

"I cannot pause here. I must speak. If you love him, I have been false to him. I have misunderstood. I have trodden roughly on sacred ground. What I thought it right to say to him I said without seeing where I stood."

"But now," she said, "I must understand all this. I confess I do not. You ask me if I love Mr. St. Clair, your friend."

"That was what I said."

"And it was more, so much more, than you ought to have said. But now I will answer you. I do not think many women would — I will. I do not. You have gone to the limit of friendship, and perhaps beyond. And now please to ask Mrs. Vincent to come; I must go away. I had only a few minutes."

All this was said with unusual rapidity of speech, and she rose as she spoke.

"One moment," I said.

"Not one," she said with a nervous laugh, taking up the bud I had left on the table and plucking it to pieces leaf by leaf. "Oh, not a minute," she repeated. "Please to ring."

"Alice Leigh," I said, and, speaking, caught her wrist, and felt as I did so the slight start of troubled maidenhood, "let the poor rose alone. Try to think it is my life you are busy with. What will you do with it — with me?"

As I spoke, she regarded me a moment with large eyes, and then sat down as if suddenly weak, her fan falling on the floor. Some strong emotion was troubling the pure lines of her face. What was it? Pity or love? Then, looking down, she said, as if to herself, "And is this the end?"

"Of what?" I said faintly.

"Of me, of my life, of it. Why did you speak? Am I wrong? Am I right? Why were you so cruel as to speak — to speak now? You might have seen; you might have known. I have duties before me; I have a life. I — I am not fit for — for anything else. I mean to be. Oh, I wish I were not a woman. Then, then I should know how to do what is best, what is right." And upon this, to my bewilderment, she burst into tears and sobbed like a child.

"Alice," I said, "I love you."

"I know, I know," she cried. "And the worst of it is I — I — O Owen North, be very good to me. I meant to have done so much."

"Are you sorry?"

"Yes. No; a thousand times no."

"Oh, here is Anne Vincent."

"My dear child," said that matron, "your fan is in a dozen bits."

"And so is everything else, Anne Vincent — everything. Let me go."

And she ran out of the room, and left me to tell the end of this story to my friend and hers.

THE END.

*S. Weir Mitchell.*

## "WHEN ON THE MARGE OF EVENING."

WHEN on the marge of evening the last blue light is broken,  
And winds of dreamy odor are loosened from afar;  
Or when my lattice opens before the lark has spoken,  
On dim laburnum-blossoms and morning's dying star;

I think of thee (O mine the more if other eyes be sleeping!)  
Whose great and given splendor the world may spare and see,  
While, day on day forever, some perfect law is keeping  
The late and early twilight alone and sweet for me!

*Louise Imogen Guiney.*

## III. WINNING THE FAVOR OF FERDINAND AND ISABELLA.

DRAWN BY OTTO BACHER. FROM A PHOTOGRAPH BY J. LAURENT & CO.  
BAS-RELIEF OF FERDINAND AND ISABELLA OVER THE  
DOORWAY OF THE UNIVERSITY OF SALAMANCA.

THE many journeys of Columbus since quitting Portugal, and the little advantage that followed his negotiations in Seville and Puerto Santa Maria, had aggravated his poverty, and he went about so ill clad that he was named the "Stranger with the Threadbare Cloak." In this straitened condition he presented himself before the royal pair. In Ferdinand political sagacity predominated; in Isabella the moral nature. The pious king believed, notwithstanding his piety, in the efficacy of works, and professed the dogma of aiding to execute the divine will, which he generally found favorable to his undertakings; Isabella, with her enthusiasm, trusted in her hopes and in prayer. The queen was all spontaneity, the king all reflection. She trod the paths of good in order to attain to good, but he scrupled little to resort to dissimulation, deceit, and, in case of necessity, crime. Valiant and warlike, Ferdinand joined the strength of the lion to the instincts of the fox. Perchance in all history there has not been his equal in energy and craftiness. He was distrustful above all else; she, above all, was confiding. He was all mind; she all heart. Isabella took pleasure in increasing the number of her vassals, that she

might possess a dominion over human souls, whereby to swell the ranks of true believers upon earth and of the elect in heaven; Ferdinand took pleasure likewise in the growth of the Church and of Christianity, but above such religious gratification he set the satisfaction born of domination and conquest. Daughter of a learned king, and of an English mother who died bereft of reason, Isabella had a clear perception of ideas and lived in a ceaseless state of exaltation. Son of that quarrelsome and wily king John II. of Aragon, and of a mother of masculine and ambitious nature, Ferdinand inherited on the paternal side a mixture of political and warlike temperaments, and on the maternal that incredible ambition which led him to add to his royal house and to his native country by conquest and by marriage. The two founded the Inquisition; Ferdinand for political reasons, Isabella for religious ends. Both were conquerors; Isabella gained Granada for her Castile, and Ferdinand, Navarre for his Aragon. The conquest of Granada reads like some book of chivalry, the conquest of Navarre like a chapter of Machiavelli. By the one achievement Isabella expelled the Moors; and by the other Ferdinand drove the French from our peninsula.

As a natural consequence of their different temperaments, Isabella and Ferdinand each dealt with Columbus as their several natures prompted; the queen ever enthusiastic, the king, as usual, cautious, guarded, crafty, and reserved. He computed the cost of the enterprise, and the returns it might yield; she thought only of spreading the dominions of her idolized Castile and winning souls to Christianity. Besides all this, the sea had its temptations for the queen of Castile, for all her enterprises and conquests tended oceanward, just as her great rivers, the Tagus, the Duero, the Guadalquivir, and the Miño, flowed toward the main. With Ferdinand it was quite the other way; his conquests trended like the Ebro, the Llobregat, and the Turia toward the waters of the Mediterranean. The Canaries were the island domain of Isabella; the insular possessions of Ferdinand stretched from the Balearic Islands to Sicily. Ferdinand dreamed only of Italy; Isabella of Africa. Hence, the one looked toward the past, the other toward the future. But both were great with a measureless greatness,

for they assumed the stature of a great idea, and obeyed, by ways and deeds, as much in contrast as their characters, the quickening spirit and the transcendent impulses of the creative era in which they lived. The unity of the state, of the territory, of the laws was imposed upon them by the age, and to the attainment of such unity were all their efforts consecrated; so that, besides winning for themselves renown, they did good service to their nation and their time.

The sovereigns heard Columbus after their respective natures, Isabella with enthusiasm and Ferdinand with reserve. But the king's reserve and the queen's enthusiasm tended to like results, and made delay inevitable. The reconquest of Granada admitted of no rival undertaking. It was impossible to divert the royal minds from that paramount purpose. So they referred the matter to the queen's confessor, Fray Hernando de Talavera. Accustomed as we are to modern ideas and customs, it is hard to comprehend the genuine father-confessor of the fifteenth century, the supreme counselor of the sovereigns in virtue of his office and in the confidence of the confessional. Fray Hernando de Talavera, first prior of the monastery of El Prado in Valladolid, later bishop of Avila and lastly archbishop of Granada, when seated in the confessional, deemed his seat higher than the throne, and held himself to be the dispenser of the earthly and eternal salvation of the sovereigns. Even in his first confession he had an altercation with the queen; for when Isabella desired to confess either standing or sitting, he replied that she should do neither, but kneel at his feet. He was as rightly able to call himself Minister of State as of the Treasury, and as well Minister of the Treasury as of Instruction and the Fine Arts, without question as to the ministry of Good Behavior; and so Isabella confided to his zeal the management of the debt equally with the choice of her daily reading in the royal library, and asked his counsel alike concerning the most important decrees and the most ordinary household affairs.

The good Talavera's acts were governed by no monkish scruples; he reprimanded with the severity of the patriarch, and even with the rod of the pedagogue, the foremost and most saintly queen of Christendom. He had but one certain, fixed, continuous and abiding idea—the conquest of Granada. At a time when all his thoughts were absorbed in this one idea, and all his powers devoted to it with that force of concentration and of will which he was universally admitted to possess, Columbus came, with his tremendous schemes, distracting the reverend scholastic from his traditional convictions, and from his purpose to regain Granada.

The aversion with which Talavera regarded

the Indian project was therefore natural and inevitable. To him it was an innovation fraught with peril to the general beliefs, and a criminal malversation of the public resources in behalf of an object that in truth seemed sacrilegious beside the completion of the seven-century epic of endeavor by the reconquest of that sultana among the cities of Ishmael, and beside the triumph of the Cross that he adored with fervid and ceaseless worship. When the queen on many occasions, before the conquest, promised Talavera an archbishopric, his answer always was: "Either will I be archbishop in Granada, or archbishop nowhere!" Such was Talavera.

The sovereigns could hardly have entrusted to a person more unsuited for so high a duty the decision of this arduous problem. Talavera was assisted by a man of competence and brains, the royal counselor, Maldonado; who, however, believed the less in the scheme the more he heard of it from the eloquent lips of its author, and went about arguing the impossibility of the thing imagined and proposed by Columbus. The primary ground of his disbelief lay in the assumption that the theory of Columbus rested indispensably upon the spherical shape of the earth, which was from every point of view inadmissible, because the Psalms described the heavens as a stretched-out curtain, and because St. Augustine treated as a heresy the existence of antipodes in another hemisphere, with their feet turned toward our feet and their heads downward. In that age, doubtless, when religious objections prevailed above all others, needs must that the discoverer should study holy writ and theological problems together, and acquaint himself with the mystical ideas of his own and older times.

To make clear all these vague imaginings that envroned his purpose, and to meet the theological scruples that opposed his arguments, he steadfastly searched the Scriptures, and found therein confirmation, not only of his personal mission to redeem Zion from her chains, but to redeem our blind and erring race in Christ. For him there was scarce a psalm or a prophecy but lamented the manifold transgressions of Israel that had brought captivity upon Zion, and foretold a liberator who, in truth, could be none other than himself, Columbus. The book of Kings, the Psalms, the prophecies, the book of Job, all predicted the redemption of Jerusalem by such a man as he, divinely chosen and predestined to providential ends. At times, in the confusion of his mystical conceptions, he added that not only was he personally called by the Lord to such an achievement, but that Joaquin de Flora in his writings had designated Spain by name, and the Bible, too, pointed out the furthest nations of the west with singular clearness. He steadily claimed that this resto-

STATUE OF FERDINAND, IN THE CATHEDRAL, MALAGA.

ration of the holy house of Jerusalem to Christianity had from an early age inspired all his voyages. So, therefore, he asserted that he had not imbibed his theory from cosmography, astrology, or any other of the profane sciences so thoroughly familiar to him, but from constant study of the revealed word of God that leads mankind to righteousness and the truth. Yet neither Hernando de Talavera nor the counselor Maldonado cared to believe him, and

they reported *a priori* against the possibility of the discovery, whereupon the sovereigns put off any new examination of it until better times.

But, whilst some were thus disheartening him, others were aiding him with their support and encouragement. Among the adepts who espoused his ideas shine conspicuously the Franciscan padre, Antonio de Marchena, and the Dominican padre, Diego de Deza. Doubtless the former upheld him in Andalusia with his

counsel and assistance against the adverse opinions of Talavera's Cordovan junta, while the latter by his learning and influence opened to him the portals of Salamanca. There is no tradition so well grounded as that which holds up to the world the strange ignorance of geography and cosmography prevailing in the Salamantine university, which went so far as to put all its doctors unanimously on record against Columbus, and to oppose the superstitions of the vulgar mind against the presentiments, the predictions, and the prophecies of genius and learning. Nevertheless, this popular belief is not only to be reversed and forever regarded as groundless, but to Salamanca is to be attributed the beginning of the good fortune of the discoverer, for with his sojourn in that learned city coincides the first pecuniary aid advanced by the sovereigns to assist his scheme. \*

All the investigations made and documents discovered during recent years confirm the sagacious opinion of the learned Salamantine writer, Señor Rodriguez Pinilla, who holds that the first flat refusal of the court to entertain the scheme of Columbus was made in the official council at Cordova, over which Hernando de Talavera presided, and that the first signs of a favorable disposition on the part of the State are seen in the sums which the sovereigns ordered to be paid to the extra-official councils, the commissions of the university sitting in the great hall of San Estéban, whereupon a speedy understanding followed between the crown and Columbus.

It is the historical and unquestionable fact, that soon after the conferences of Salamanca, held at the beginning of 1487, the sovereigns began to give the necessary orders for supplying the discoverer with funds, and to provide for his treatment as a royal retainer by recognizing his right, wherever he might be, to maintenance and lodging. In a bundle of old accounts of the treasurer, Francisco Gonzalez of Seville, which may be seen copied in the second volume of Navarrete's celebrated collection, are found the following entries:

On the said day [May 5, 1487] gave I to Cristóbal Colomo, a foreigner, who is now here performing certain things in the service of Their Highnesses, three thousand maravedís, on the warrant of Alonso de Quintanilla, by command of the Bishop [of Palencia].

On the 27th of said month [August, 1487] gave I to Cristóbal Colomo four thousand maravedís, to go to the Royal Seat [Malaga], by command of Their Highnesses and on a warrant of the Bishop. This makes seven thousand maravedís, with three thousand which were paid to him by order, to defray the cost of another journey on the 3d of July.

On the said day [October 15, 1487] gave I to Cristóbal Colomo four thousand maravedís, which

Their Highnesses ordered to be paid to him to help defray his expenses.

On the 16th of June, 1488, gave I to Cristóbal Colomo three thousand maravedís, upon a warrant of Their Highnesses.

The writings of the time contain countless evidences of the confused clashing of ideas in all minds. As neither Vives nor Bacon had yet employed the cognition of natural phenomena in the study of material things, and as neither Pereira nor Descartes had applied the observation of psychic phenomena to the mind, there prevailed a traditional system, which, like the ancients, heard with laughter the voice of the oracle, and mingled the teachings of the recently revived classic authors, resuscitated and new-come from a supernatural sphere, with the confused theories of the Christian writers. Thus, for instance, Albertus Magnus averred the existence of two races of black Ethiopians, belonging to the two opposite hemispheres. But these affirmations of the great medieval philosopher could in no wise prevail against the sixteenth book of "The City of God," in which St. Augustine outlines a universal history literally taken from the Bible, and denies the existence of the antipodes, because of the impossibility of their being descended from Adam, and because they would give the lie to the blessing pronounced upon the sons of the patriarch Jacob, and to the division of the earth between them as recorded in Genesis. But those illustrious collegians disputed alike concerning the dispersion of the human race to the four quarters of heaven, and the distribution of the solid and liquid parts of the unknown planet. While the opponents of Columbus alleged as the outcome of their calculations that the ocean was of vast extent, and that therefore it was impossible to discover the Indies by sailing downward to the west, owing to the physical difficulty of ascending the watery steep on the homeward voyage, his supporters, relying upon the sixth chapter of Esdras, declared the land to be sixfold greater than the sea, and that consequently the East Indies could readily be reached by going westward, since their eastern shores could be but a short distance beyond the Pillars of Hercules and the Bay of Cadiz.

Columbus maintained these latter assertions with much persistence, as Padre Las Casas tells us, resting equally on the verses of the prophet Esdras, then of general acceptance, and on the writings of Cardinal d'Ailly, his oracle, who likewise deemed the sea of small extent compared with the land, in conformity with passages from Aristotle, Seneca, and Pliny, who, according to him, must have known much about the earth, for the singular reason that the two first were the preceptors of Alexander and Nero.

and the latter the friend of Trajan, three widely traveled emperors, who in the course of their continual voyages and nomadic life must have gathered abundant knowledge of the physical distribution of the earth and the characteristics of the various races of men. The authorities

upon which the partisans of Columbus relied did not stop here, for they gathered a rich harvest of other proofs from writings such as Pliny's "Natural History," which, in the seventh chapter of its second book, recorded facts in regard to the sea and its secrets sufficient to

stagger and bewilder the most expert: such as the perfect ease of navigating the sunset seas; the exploration of the Indian shores by the ancient Seleucians, who inherited in Syria the power and glory of Alexander; the expeditions which, setting out from Baetica afterward sailed in the waters of Mauritania and others even further south; the remains of Spanish ships seen by Prince Caius in the Arabian Gulf in the time of Augustus; the world-girdling voyage of the Carthaginian Hanno, abundant in prophetic statements; the arrival of one Eudoxus at Cadiz by unknown and mysterious courses, fleeing from Ptolemy, and a hundred tokens more, each fitting better than the other the project then under consideration, with various embellishments that served with some show of consistency to give it weight and authority.

Again, Macrobius, in the second book of his commentaries on Scipio's "Dream," afforded weapons to the friends of Columbus; for, in the midst of many errors, he vaguely maintained the rotundity of the earth and the existence of the antipodes. This opinion seems to have been shared by Polybius, Mela, and Solinus, who are cited by Las Casas in his great "History of the West Indies," a work very favorable to the memory of Columbus. To the vexed problem of the antipodes there was joined another, concerning the habitability of the torrid and frozen zones, which was generally denied, notwithstanding the testimony of Columbus that he had sojourned in Iceland and in Guinea. Paying no heed to the practical proofs of experience, the contestants resorted to ancient authors for evidence, and recited how Aristotle, in his book "Of the World," strewed the western seas with numerous islands and even continents greater than our known world, all of them perfectly inhabitable; how Lucan in his poems alluded to a mysterious tribe of Arabs, scattered through unknown deserts; how Marcianus taught Pliny the existence about the north pole of the Hyperboreans, fortunate in being born and reared under the frondage of elysian groves, and so long-lived that family succession could only be effected by suicide in leaping from the crags of the highest mountains—an expedient often resorted to, it seems, in the torrid zone also, where the life-giving ocean winds prevail; how two such diverse authors as Avicenna and Anselmo told of groups of islands, lost and forgotten, like gigantic pearls, in the wastes of the Shadowy Sea; how Plato, in his divine dialogues of the Timæus and the Critias, commemorated a land called Atlantis, which stretched with reefs of coral and groves of palms, and opaline seas and mountains of gems, between the Pillars of Hercules and Africa's western shores even to farthest Asia, swallowed up in the abysses, but still showing its

traces in the sunken forests of rare and unknown leafage that stayed the keel of the passing bark, and held it in their vast embrace; how the Platonists had inherited their traditions of the mysterious Atlantis from the wise lawgiver Solon, who in turn derived it from the mystic Nile; how the principal classical geographers connected with the disappearance of Atlantis the submersion of Acarnania in the Ambracian Gulf, of Achaia in the Corinthian Sea, of a part of the Asian and European continents in the Propontis and the Euxine Sea, the cleavage of the two splendid shores of the Bosphorus, and the comparatively recent formation of Lesbos; how Seneca in the sixth book of his "Morals" attributed to Thucydides the attempt to assign a definite date to the submersion of the Atlantean continent; how certain legends told of the former union of Africa and Europe by an isthmus between the two shores of the straits, recorded the disappearance of an arm of Guadalquivir, and told of strange plants and seawrack seen filling the ocean to the westward of the Canaries; how St. Ambrose, in his discourse upon the "Vocations of Men," declared a perfect and assured hope of bringing to day far-off regions where new races should receive the light and revelation of the Gospel—confused and contradictory legends, all of them, well calculated to lead astray an unfixed and irresolute mind, but not the mind of Columbus,—that prophet absolutely confident in his own predictions,—who, in the midst of such a sea of confusion, begotten of innumerable reports, some known to him and others unknown, listened only to the sure voice of his heaven-decreed mission, and pressed on, with firm and invincible will, toward the realization of his divine ideal.

A practical result followed all this upstirring of diverse opinions, in that the pilot reached a better understanding with the sovereigns and gained a more effective patronage for the plans which the Cordovan junta had condemned. But although aid was frequently, and even abundantly, given, despite the interminable straits of the court, a decisive decree ordering the voyage itself could not be obtained while the paramount efforts for the reconquest blocked the way. After the sojourn in Salamanca, the royal pair undertook the conquest of Malaga, and during its progress Columbus shifted about, now at the siege of the city, now at the court in Cordova, and at one time even in Lisbon. Many deny this last journey of his, but we need not be surprised at their denial, seeing that such uncertainty and perplexity reigns among the historians of that age that some among them are ignorant of and deny the conferences of Salamanca, locating in Cordova and Granada the two commissions convoked to

hear the discoverer and investigate the discovery. But there is no room for doubting the visit of Columbus to Lisbon. It suffices that we possess the letter of Dom John, granting him safe-conduct and immunity from any suit for debt in 1488; and we have moreover a famous marginal note written by his own hand in his favorite volume, "De Imagine Mundi," of d'Ailly, wherein he records the coincidence of his journey to Lisbon with the discovery, so favorable to his plans, of the extremest point of southern Africa, known as the Cape of Good Hope.

We know naught of what Columbus did during his last visit to the fair capital of Portugal; we can fix neither the date of his departure nor of his return; but we may certainly say that he gathered there all the facts then attainable in that era of geographical discovery, and set them down with wise diligence and scrupulous exactness in his memory and in his books. Bartolomé Diaz had in fact just discovered the Cape, beyond which the superstitious dread of his sailors prevented his going. The world had taken another stride toward the realms of Prester John, that weird goal which stimulated countless expeditions and so strongly influenced the dreams of Columbus. The abode of that mysterious personage, said by Marco Polo to lie in the odorous forests of Central Asia, stretched, as conjectured by the Portuguese Corvilhan, to the crags of Abyssinia amid Libyan sands; and, when the tidings spread, the pilot-discoverer could not fail to note the hardships suffered in the search for the Cape, thenceforth already known by the contradictory names of Good Hope and Tempest. In his preserved memoranda he records how, in a second attempt, he would have abandoned the use of ships of large size, preferring vessels built so solidly as to defy the fierce gales, yet small enough to enter any arm of the sea; and how he would have taken three times the quantity of ship's stores needed for a long voyage that had been taken on previous voyages—and in this he showed his good judgment. Tempests so often lashed those waters, and with such fury, that ships foundered in the turbulent waves. But now the Sea of Shadows was dispelled; Africa almost circumnavigated; Prester John almost within reach of the hands stretched out to him from every quarter; the Eastern Indies brought very near—almost found, indeed—by expeditions as daring as Alexander's; the aroma of new spices spread in the senses of men; and the fountain-head of humanity and of history well nigh discovered, the Aryan land of fetishes and castes, of palanquins and palms, of gold and gems, of symbolical flowers and prehistoric fables, completing the planet with its exuberant life, and coinciding with the resuscitation of Grecian statues from the dust and ruins of the olden

time, and with the hope of discovery of new worlds in the time to come. But Columbus, who noted down prophecies and fables alike, records in his marginal memoranda how Bartolomé Diaz sailed six hundred leagues beyond the furthest known limits of navigation and discovered the Cape of Good Hope; whereby, taking its latitude by the astrolabe of Behaim, he proved not only that it lay forty-five degrees south of the equinox, but also three thousand five hundred leagues distant from Lisbon. The mathematician and the prophet were blended in Columbus, who, just as he read, with sacred reverence, Esdras and Job in his prayers, accepted as mathematical truths latitudes and distances which he set down in bald figures.

As soon as Columbus returned from Portugal, he endeavored to renew his negotiations with the sovereigns; but he found the physical road to their court, and the moral pathway to their hearts, blocked and impeded by his having been lost sight of during his unfortunate absence, and by the absorption of all minds in the Moorish war. The sovereigns, having won at Malaga and Velez-Malaga, were spurred on by the seductive power of victory to continue their task, now become easier through the innumerable internal dissidencies of the Granadian kingdom, broken into fragments, which were held, like hostile fortresses reared against one another, by the three nominal kings of the Moors, Hacem, Boabdil, and Zagal. So, after convoking in Aragon one of their famous cortes, quickened with the life-giving breath of liberty, and after celebrating at Seville, with jousts and tourneys and festivals, the marriage of their eldest daughter Doña Isabella to so powerful and eminent a youth as was Prince Miguel, heir to the crown of Portugal, they turned anew their thoughts to the necessary completion of the glorious work of reconquest. It was an inauspicious moment to discuss any other business. The partizans of Columbus had increased, and, withal, their individual influence. Quintanilla, the good and thrifty comptroller, gained importance in proportion as he displayed his talents in procuring for the royal treasury large levies, to which he often added advances from his private fortune; Mendoza, the faithful cardinal, increased his power and won distinction in proportion as his charity aided the living and his prayers the dead—without losing sight of the everlasting struggle against the Moors; the Marchioness of Moya, whose splendid garments and gorgeous tent, during the siege of Malaga, exposed her to a violent death, for she was wounded by an Arab *santon* who mistook her for Isabella, had won the heart of the queen, who declared that never would she have reigned in Spain without the vote of her

This convent has been preserved as a National Memorial since 1846. Cortez also found shelter here after his return from Mexico.

friend's husband; yet despite the great authority and influence of all of these in the royal government and in the Christian camp, they remained mute as the dead, and dared not divert a single man or doubloon from the chief enterprise of the day. While Columbus knocked at every door, offering continents to men whose sphere of action was confined within a single city, the devastation of the Granadian estates under the Christian invasion; the investment of the conquering hosts round about Baza — where a Spanish city had been reared face to face with the Arab town, both glowing with festivals and combats, the knightly feats of the Pulgars awaking among the soldiers of the Cross a new zeal in the religious crusade, and bequeathing to Moorish poetry new strains in the national epic tale; the last but one of the Moorish kings upon his knees before the Catholic Sovereigns, offering to them in homage, within sight of the blue sea fringed with wild fig-trees and roseate sea-walls, the city of Almeria, crowned with towers and palms; the ambassadors of Turkey, come from Jerusalem the captive to stay the arm stretched out over cowering Granada, who in her tribulation ap-

peared beautiful as Zion of the prophets; the rampart of the mighty Alpujarras, flaming beneath the sun of Andalusia and odorous with oriental jasmine, yet echoing with the clash of bloody but poetically heroic combats; Salobreña, scene of the death of the aged Hacem, that scourge of Christendom, whose memory is tearfully sung in elegies of his race which call to mind the sublime lamentations of the scriptures; every laurel-tree of the Vega turned into a warrior's lance, and every link of the fetters unrived from the feet of the captives redeemed in thousands by these same lances; every garden become a scene of ceaseless encounters; every dwelling made a fortress of defense and a goal of attack; all that broad plain a Homeric field of Troy, the end of a century-old war and the beginning of a new fatherland; all these things left no room for any undertaking apart from that marvelous epopee. How then, in such a moment, could thought be given to Columbus?—until then scarce heeded, and now forgotten!

COLUMBUS, on seeing himself forgotten, contemplated, as a last stern resort, the beginning

of his task anew by offering it to other monarchs, and of reliving his past by quitting Spain as he had beforetime quitted Portugal. He determined therefore to appeal to the French court, finding encouragement in his bitter affliction by discerning there some ray of salvation and some dawn of success. In this dejected state, he went to Cordova to take farewell of Doña Beatrice, and to kiss Ferdinand, the offspring of his love for her. From Cordova he seems to have gone to Seville to confer with such friends as the Geraldinis, and to make his sorrows known to them, so that they in turn might inform Mendoza; from Seville to Marchena to tell his old protector, the wise monk Antonio, the sad tale of his faded hopes and the ill-success of all his aspirations; from Marchena to Huelva in search of his brother-in-law Muliarte and his son Diego, the latter left under the care of his uncle while Columbus was leading his anxious and restless life of endeavor; from Huelva, with the wandering impulse of a stricken man, under the terrible hypnotism of monomania, and suffering from nervous attacks like those that herald dementia or death to the madman or suicide, he went in search of some isolated and solitary convent, whither

and, ah! for the discovery of worlds which, compared with the Infinite, are but as atoms; penitents and recluses about him that to his soul seem but as shadows—in all these is found an explanation of the refuge sought by Columbus at La Rabida. The old traditions assign his sojourn at the convent to the hour of his arrival and of his high hopes; contemporaneous criticism, better informed, fixes it at the period of his departure and his disenchantment. And herein is the chiefest glory of that spot, that it was the scene of the new birth of a lost hope. And this hope returned because Columbus was devout, and was beloved of those devout men. It was a sacred rock of faith, whereon sprang the purest of all affections—the affection of inexhaustible admiration mingled with unquenchable friendship. Let hatred and envy know that the humble Franciscan monk, Juan Perez, in truth discovered the New World, through his deep friendship and admiration for Columbus.

Juan Perez, astounded at the dual flow of religious and scientific ideas from Columbus, would recall the many things he had heard, from the pilots who swarmed thereabouts, of the vast ocean and its distant shores. But none

VIEW OF LA RABIDA, SHOWING THE GATE AT WHICH COLUMBUS HALTED FOR ALMS.

he could flee, as to the shadows of the tomb, and in eternal silence find relief from the sorrows of his overladen heart. When he turned away from the Vega, where every passer-by pauses to look upon the Vermilion Towers, and from that city where none remembered him or his great project, the convent of La Rabida must have seemed to him like a beacon-light in the black night of shipwreck.

A little inclosure, pine-shadowed, in the solitude; the measureless western ocean before his eyes; a cloudless heaven toward which to turn a clouded sight; a pavement of sepulchral stones; cloisters wherein to meditate and prepare for the end; sanctified altars to which to cling in hope of pardon and of an eternity too long unthought of amid thirstings for earthly glories, less substantial than a vapor-wreath,

among them went further than the astrologer and cosmographer, Garci-Fernandez, who, led on by the padre and charmed by the words of Columbus, was ready to avouch the probability of reaching the oriental Indies by sailing across the western sea. It is ascertained that they sent a certain gentleman named Sebastian Rodriguez, an inhabitant of Lepe, to the camp at Santa Fé, with letters from Juan Perez to the queen; that Rodriguez returned a fortnight later with a positive and urgent command for the monk to present himself at the court; that he, being not only enthusiastic but active too, borrowed a serviceable saddle-mule from a farmer named Cabezudo, and set out, by cross-cuts and byways, at the risk of his life and liberty, for the royal seat at Granada; that the father-superior saw the queen, receiving from

her hands twenty thousand maravedís in florin-pieces, to be sent in charge of Diego Prieto from Palos Alcalde to La Rabida, and by him delivered to Columbus, who, provided with a decent mount and suitable apparel, was thus enabled to present himself to receive the wherewithal to fit out three caravels which the sovereigns were pleased to supply for the glorious voyage.

Columbus arrived, and the queen at once told him that she could not formally attend to

moment. Everything then looked toward the approaching siege; the new city face to face with Granada was then being built in proof of a determined purpose; and there was no room for any thought alien to the great reconquest. But, returning now, he found Granada well nigh a suppliant at the feet of the sovereigns, and his project accepted so soon as the city should surrender. Columbus gladly remained there, and joined valiantly in the fight. At length, on the morning of January 2, 1492, Bo-

anything whatever until after she had taken Granada. So intimately is the triumph of our Cross in that famous siege linked with the discovery of America in the ocean-wilds, that the succeeding scenes of our narrative could not well be described without likewise relating that surpassing episode. Juan Perez, although the need of his return to La Rabida was urgent, did not go back, on account of his enthusiasm for the discoverer and the discovery, until after he had earnestly commended the business to the queen, and had seen her old zeal reawakened in favor of the new project and its great originator. There was a marked difference between the visit of Columbus after his return from the court of Lisbon, and his arrival at this supreme

abdil, with his brilliant following, surrendered himself to the king Don Ferdinand. A legion of pages, with gold-embroidered garments, went before the king on foot, opening the way for his triumphal procession to the high scene of his glorious conquest. The most exalted ricos-hombres of Castile and Aragon, mounted on gaily trapped palfreys and clad in robes of state, surrounded the monarch, with such display of blazonry and insignia, such splendid apparel, such varied standards, such gorgeously attired mace-bearers, that they seemed themselves to be an army of kings. Ferdinand II. had donned his royal robes, and his crimson mantle lined with ermine almost concealed his horse, while the countless crowns of his house and

line were seen in miniature, glittering with jewels, attached to his splendid, plume-be-decked cap. Boabdil, on the contrary, was clad in black, as befitting his dignity and his situation, wearing a casque of gold-incrusted steel adorned with mottos appropriate to his rank, his body covered with those famous oriental amulets whose efficacy he himself had never known, but in whose potency the wretched man trusted even in the midst of his irreparable misfortunes. He attempted to dismount when he came to Ferdinand, and even removed his feet from the stirrups in order to alight and kneel before him who had broken and humbled him, but an imperious gesture of the Christian monarch stayed his purpose. Whereupon, deeply moved by such signs of kindness and benevolence, the Rey Chico, the "Little King," begged earnestly to kiss the royal hand, but Ferdinand replied that such homage was proper from a vassal to his lord, never between equals. Then Boabdil, reining his horse by the side of the Aragonese king, eagerly bent forward and imprinted an ardent kiss upon the latter's right arm. Having fulfilled this act of courtesy, which he deemed to be imposed by defeat upon the vanquished, he quickly put his hands to his girdle, and his tawny visage flushed as they touched the thing they sought, the two great keys of the magic city, keys that opened the twin portals of that paradise whence Mohammedan genius and Mohammedan culture had shot forth their last rays of dying splendor. In relinquishing those keys, Boabdil believed perforce that he gave up, with them, the mosques of his God, the tombs of his fathers, the honor of his race; and he cursed the evil hour wherein he had been begotten of Hacem, and the evil star that frowned from the heavens upon his birth, predestining him to behold the downfall beneath his hands of the miraculous work of Musa and of Tarik, the remnant of the empire set up by the Abderramans and the Almansors over all Spain, to the amazement and dismay of all the world. The Arab *santon*, clad in a white woolen robe whose folds enwrapped him like some funeral statue, with flowing sleeves sweeping the ground, and upon his head the swathing linen turban like the tiara of clouds that wreathes the mountain's brow, sought not to explain the cause of their ruin, but exclaimed, "God alone knoweth!" In his turn the warrior, still wearing his coat of mail, with shield on arm, quivering lance in rest, and scimitar at his side, made token of submission by laying his accoutrements aside, pronouncing the fatalistic phrase, "God doeth all things!" And Boabdil, who embodied the might of his state, the will of his people, and the power of that nation so illustrious and so great in other times, on

beholding the towers of the palace of his fathers fading from his sight, and the crown of Alhama, that in the Eden-fields of Granada had resisted for three hundred years the victories of the Christians, falling from his brow, instead of revolting proudly against his lot and striving with determination to the last, exclaimed, "God willeth it!"

The keys having been given up, Boabdil asked for the knight who, under the noble authority of the sovereigns, was to rule over Granada; and when told that the celebrated Count of Tendilla, Don Inigo Lopez de Mendoza, had been chosen, he turned to him, and, taking from his own finger a golden ring set with a precious jewel, he addressed him in these historical words: "With this signet has Granada been governed. Take it, that you may rule the land; and may Allah prosper your power more than he hath prospered mine."

El Zogoibi, "The Unlucky," continued on his path of sorrows, and after having thus met Cardinal Mendoza at the gate of the Siete Suelos, or the seven-story tower, and King Ferdinand on the heights of San Sebastian, he met the Catholic queen at Armilla, upon the Vega, on the road to the royal seat of Santa Fé. Isabella, like Ferdinand, was clad in festal robes, and was seated upon her horse as on a throne. Upon her brow glittered that glorious crown that so soon was to rule two worlds. Her son, the infante Don John, in garments of oriental richness sparkling with gems, rode on a spirited charger by her right hand, while on her left were the princesses, gaily and richly adorned in robes of mingled Florentine brocades and gauzy Moorish tissues. A crowd of noble ladies and of pages of exalted birth formed her court, and added, if it were possible, to its splendor. Inspired by feelings of natural delicacy, the sovereigns had planned that upon that spot the sorrows of the vanquished were to be compensated by an act which would carry joy to his heart. The first-born of the Moorish king, who since the compact of Cordova had remained a hostage in the power of his enemies, was there set at liberty and restored by Isabella to his father. Hitherto Boabdil had shed no tear, but now, on beholding again the son of Moraima his beloved, he pressed his face against the face of the poor child and wept passionately of the abundance of his heart.

Thereupon the governor of Cazorla, to whose custody the Christian monarch had committed the Rey Chico, invited him to go on as far as Santa Fé, where, in accordance with the royal orders, he was lodged with the greatest courtesy and pomp in the pavilion of Cardinal Mendoza, as had been agreed. The day wore on, and the silver crucifix, borne in the hands of Mendoza to crown and complete the story of

seven centuries, was not yet displayed upon the heights and bastions of the Moorish palace. Isabella, who impatiently looked for its appearance, had found distraction from her thoughts in awaiting the coming of Boabdil and in her meeting with him. But when the Moorish king passed on, and nothing remained to occupy and divert her mind, she again began to glance eagerly at the towers and to be apprehensive lest in that supreme moment some untoward mishap might have befallen the noble cardinal. The Moors, who had thronged about in the early morning, filled with curiosity and with the desire to see the marshaled hosts of the Christians and their gleaming armor, withdrew to their dwellings as to the silence of the tomb when the emblazoned Cross entered beneath those wondrous oriental archways. Granada seemed to be a deserted city in the forenoon of that miraculous and memorable day of deliverance. The hours passed, and the Cross shone not upon the Vermilion Towers, bathed in the rays of the sun that majestically rose to the zenith. Isabella, in her impatience, began to fear that the terms of the capitulation had been violated, and that the cardinal had perchance become the victim of some ambushade. But at high noon, upon the great watch-tower called *La Vela*, the emblem of the Cross appeared in all its glory, shining like a day-star in rivalry with the dazzling sun; and when they beheld it gleaming there, upon the greatest and loveliest stronghold of the Koran, illumined by the mystic light of innumerable martyrdoms, and surrounded by the souls of the countless heroes of so many generations, all the soldiers and all the magnates, kings, princes, bishops, *ricos-hombres*, and all beholders whose hearts throbbed with the Catholic faith and with love for their Spanish fatherland, knelt upon the ground, with cross-folded arms, and to the mystic sound of trumpets and clarions as to the tones of some vast organ they intoned a devout "*Te Deum*," which rose as it were from the heart of the whole nation—a nation that for seven centuries had fought for the sacred prizes of independence and unity, from *Covadonga* to *Granada*.

Moreover, that sublime day was a time of resurrection. The graves were opened and the dead arose! Yes, five hundred captives joined from their dungeons in the "*Te Deum*" whose sublime strains proclaimed the redemption of our liberties; and, even before it ceased, they came forth to freedom, singing the chants of their own faith, and laying their riven fetters on the altars of their country.

THE reconquest achieved, Columbus found himself face to face with the miracle thus wrought by the dauntless will of a people who,

confined within a narrow territory, and unaided from any quarter, by their ardent faith and native valor, for the space of seven centuries, had held at bay, and in the end vanquished, the teeming continents of Africa and Asia, whose tribes, inured to arms, reared in a warlike creed, and led by a warrior prophet, strove in vain against them with equal courage and resoluteness. Two great national virtues overcame them, fearlessness and constancy. The hour had sounded for turning these forces to the achievement of another and no less stupendous work. Columbus beheld the Moorish king on bended knees before the queen, a sinking world before the noontide sun; and he beheld the cardinal, Mendoza, upon the Vermilion Tower, holding aloft the cross that shone, beneath that blue sky and upon that ruddy height, like a resplendent star, heralding sublime ideas and consolatory hopes. In his eyes, nothing was impossible to a living faith backed by a resolute will. The "*Te Deum*" of the *Vega*, chanted in presence of a broken and ruined people, was to his soul a forecast of the future mysterious hymn of praise in presence of a new-born race and a virgin land. He could wait no longer; the declining forces of his life renewed their ardor, and impatience mastered him as the tempest sways the tree. No middle course was now possible between the alternatives confronting him; he must either seek in other lands a better opening for his schemes, or win from the power of the sovereigns the three caravels he had begged in vain for twenty years from all the principal states of opulent Europe.

Another junta of learned men appears to have assembled under the presidency of Cardinal Mendoza, very similar in its outcome to the council held under Talavera at Cordova, and under Deza at Salamanca. Geraldini often refers to it, and tells how the old stereotyped arguments were repeated, which the prophet had controverted a thousand times before. Geraldini stood behind Mendoza while the blind opponents of progress were hotly urging their adverse arguments, all based on reminiscences of erroneous teachings culled from such authors as St. Augustine. "Good theologians, these, but mighty poor cosmographers," said the young Italian churchman to the venerable Spanish bishop. To deny the existence of a southern hemisphere when the Portuguese, in several of their expeditions, had lost sight of the north star, seemed to him a piece of folly. The impulsive cardinal took up the idea, and insisted on a favorable decision, in spite of the opposition that found vent in coarse and taunting sarcasm. The court of the sovereigns was constrained to give the discoverer another hearing, and he presented his proposals as though

there could be neither doubt nor uncertainty as to the result. He spoke so confidently and so resolutely that one might have thought him already the owner of his newly discovered lands; and, assuming the discovery as a fact, he discussed its territorial organization and civil government. He demanded the supreme office of admiral, whereby he would become almost a king among kings, for the title carried with it the rank of a grandee of Castile, who remained bonneted before his sovereign. He next demanded the office of viceroy over all the peoples and countries he should discover. Furthermore, he demanded the tenth part of all the revenues, and to sit as a judge in any tribunal which might have cognizance of litigation growing out of such appropriation of the lands and division of the profits. And as the means of successful discovery, he asked for three caravels, well equipped, and a goodly allowance of maravedís.

The reaction caused by these extraordinary pretensions sent the scheme abruptly back to the beginning. Talavera, opposed by Mendoza in those days and somewhat lessened in importance since the fall of Granada, became again indignant, and declared that it was intolerable that such a tattered beggar should put on the airs of a king. Ferdinand, although surrounded by a court altogether favorable to Columbus, foresaw with anxiety the revival on the other side of the ocean of the feudal powers he had with such effort combated at home. Many persons affirmed that, if the scheme succeeded, Columbus would at a single bound become a king; and if it failed he would lose little, while the Catholic Sovereigns would be made ridiculous in the eyes of the world; for which reasons this crack-brained and absurdly ambitious visionary should be packed off to scrape his tiresome fiddle elsewhere. On the other hand, never before had the discoverer shown such masterful prescience and strength of will. He beheld the success of his enterprise so absolutely assured; his new lands seemed to him so tangible, and the seas so thickly peopled; he so positively saw the Great Khan as a living reality, the kingdom of Cathay resplendent with gold, the island of Cipango fringed with spice-trees and begirt with pearls, that he adhered obstinately to his demands, and declined to chaffer away for empty honors the gold and gems whose glitter dazzled his eyes as one entranced with the sight of such wondrous things.

Upon being thus contemptuously dismissed, he mounted his mule and galloped with a loose rein toward Cordova, to bid farewell to his loved ones and thence to shape a new course to France, where he proposed to deliver over, without hesitancy, the absolute ownership of the schemes which purblind Spain had rejected. Amid the

half-conscious reveries of that journey, the bitter reflection possessed his mind that he had chosen the Iberian peninsula as his starting-point, as being the most westerly part of Europe and the nearest to the East Indies by the westward course, yet none of the great Iberian sovereigns, of Castile, of Portugal, or of Aragon, had believed in him.

Ferdinand, being above all else a statesman, remained well contented that there was little prospect of the revival of feudalism beyond the seas after its death-blow here; but Isabella, of higher and more devout nature, more trustful, gentle, and poetical than he, regretted that she might not add to the great work achieved on land another greater sea-venture, nor give to the Church of God new regions to be consecrated and new races to be baptized as a fruit of those promise-laden victories. Aware of her feelings, the adherents of Columbus sought the queen, and earnestly represented her loss in the dismissal of the prophet and the rejection of his prophecy. Quintanilla the comptroller; Deza the learned; Mendoza the cardinal; Medinaceli the potentate; Geraldini the influential; Cabrera the royal steward; the trusted governess of the infante Don John; the famous count who, because of his close but mysterious kinship with the cardinal, stood with him on the summit of the watch-tower of Granada; Marchena, the intimate associate of the discoverer, conning with him the same books and the same stars,—all these ardently joined in earnest but respectful appeal to the sovereigns not to withhold the new world from the Church nor such an unfading laurel-crown from the nation.

But alas! even prophets and sibyls encounter in this world the stumbling-block which now baffled these two Titans of our story—the lack of funds. They possessed all else: faith, genius, inspiration, prophetic intuitions, but no money. It was as though they possessed nothing. Lope puts into the mouth of Columbus, in a dialogue with Ferdinand, who earnestly invites the discoverer to ask of him the wherewithal to prosecute the discovery, the following verses:

Sire, give me gold, for gold is all in all,  
'T is master, 't is the goal and course alike,  
The way, the means, the handicraft and power,  
The sure foundation and the truest friend.

As it happened, Isabella had no money at hand. Her war with Granada had cost a prodigious sum. She found herself in debt even to her own servants. Political reasons, of great weight with the resolute Ferdinand, who was justly content with the practical results of concentration of power, and economical reasons, of great weight also with the conscientious Isabella, who was most anxious to bring about

some system and regularity in her revenues, induced their refusal, in view of the fresh outlays required for the expedition, and of the exaggerated demands for rank and office should the expedition yield its promised results. But to the friends of the discoverer neither of these considerations appeared sufficient to warrant the abandonment and rejection of such marvelous plans.

The Marchioness of Moya remained in the noontide of Isabella's reign the same as she had been in other days, in its ill-starred beginning, and in its tempestuous dawn. First and last, she counseled decisive action. Long before, she had threatened death to any who might prevent the union of the two crowns by the marriage of the prince and princess; now she moved the mind and the will of the fortunate royal pair to undertake the chiefest of all their enterprises, and the one that was to bring them the greenest and most precious of all their laurels. Her soul was in harmony with the spirit of that century, which, after having found the printing-press in a wretched sacristy of Strasburg; after having unearthed from ancient heaps of ruins those famous classic statues whose advent rudely disturbed the penitential monkish life and rejuvenated the human form; after having, in the sibylline tome of Copernicus, set the solar sphere in the center of all the spheres and in the focus of all the planetary ellipses, was now to add to the wide discoveries of the Portuguese in the Old World by creating new lands in the ocean, to reveal the unknown Pacific and the austral pole, and to spread in the infinite heavens new suns, and constellations of more ethereal effulgence, to proclaim God's glory. The Marchioness of Moya, like Vittoria Colonna, like Bianca Cornaro, like so many glorious women of the Renaissance, awakened with the breath of her lips the splendid fire of the new ideal.

But, if she represents the idea and the impulse, Santangelo represents the practical achievement of the project. Quintanilla had opened to Columbus the pathway to the court, Santangelo opened the road to Palos. Of a family of converts, himself but recently a Christian, one of those antique Jews who have so greatly helped to enlighten the Christian world, like the Cartagenas of Burgos for instance, he joined, as is the nature and tendency of his

race, the love of the ideal, appropriate to the prophets divinely inspired of the Lord, to the reflective calculations of the schemer and the mathematician. It is a historical fact that, one day, Ferdinand V., on his way from Aragon to Castile, and needing some ready cash, as often happened owing to the impoverishment of those kingdoms, halted his horse at the door of Santangelo's house in Calatayud, and, dismounting, entered and obtained a considerable sum from the latter's inexhaustible private coffers. He must have enjoyed great power, for although some of his near kinsfolk took part in the immolation of Pedro Arbues, the first inquisitor, who was slain in the cathedral of Saragossa in the frenzy of a popular uprising, no harm came to Ferdinand's treasurer, neither did he fall from royal favor nor incur the usual penalty of infamy.

As soon as Santangelo heard of the flight of Columbus, he went to the queen's chamber, and implored her to order him to return, being supported in this by the Marchioness of Moya. And when the queen complained of the exorbitant demands of the discoverer, he reminded her that the cost would be but a trifling consideration if the attempt succeeded, and if it failed could be reduced to next to nothing. When to this cogent reasoning the queen objected the emptiness of the Castilian treasury, and the need of again pawning her jewels to raise the means, Santangelo unhesitatingly assured her of the flourishing state of the Aragonese finances, doubtless because of the revenues yielded by the expulsion of the Jews, and of the resources there available, promising at the same time to win over the perplexed and inert mind of Ferdinand the Catholic. Thereupon messengers were sent post-haste, who stopped Columbus at a neighboring bridge some two leagues away, and made him turn back to Granada, where, in April, 1492, the articles of agreement, known as the Capitulations of Sante Fé, were signed, granting Columbus all he asked. Thence he went to Palos in May, to set out in August from that port upon the new and incredible Argonaut voyage, in the course of which his search for the oldest and most historic regions of the earth of olden time was to lead him, the revealer, unintentionally and unknowingly, to chance upon a new creation.

## A WISH.

THIS be my wish: let all my lines  
 Across the pages run like vines;  
 The words, their shining blossoms be,  
 The book, a field of melody.

*Frank Dempster Sherman.*

# THE NATURE AND ELEMENTS OF POETRY.

## V. BEAUTY.

FOR the moment, and somewhat out of the order of discussion, I will assume that no poem can have birth without that unconscious process of the soul which is recognized in our use of words like intuition, insight,

genius, inspiration. Nor can it be brought to completeness without the exercise of conscious afterthought. True poetry, however, is reinforced by three dynamic elements. No work of art is worth considering unless it is more or less effective through beauty, feeling, and imagination; and in the consideration of art, truth and ethics are a part of beauty's fidelity to supreme ideals.

You will find it needful to examine the nature of that which is termed Beauty, before acknowledging that poetry can be no exception, but rather the chief illustration, when it is declared that an indispensable function of the arts is the expression of the beautiful.

With respect to the artists and critics who abjure that declaration,—as when, for instance, a critic said of an American draftsman that he was too fine an artist to concern himself about mere beauty,—I am convinced that they simply are in rebellion against hackneyed standards. They have adopted some fresh, and therefore welcome, notion as to what is attractive. This they have given a new name, to distinguish it from an established and too familiar standard. They are unwittingly wooing beauty in a new dress—the same goddess, with more disguises than Venus Mater. Some day they will recognize her, *et vera incessu patuit dea*, and again be taught that she never permits her suitors to escape. She has the secret of keeping them loyal in spite of themselves. This belief that they are free, is a charm by which she lures them to her unknown haunts, rewarding them with the delight of discovery, or ironically permitting them to set up claims for invention. One may even compare beauty to the wise and charming wife who encourages a fickle husband's attentions at a masquerade. She has a thousand graces and coquetries. At last the masks are removed. "What, is it you? And still superior to all others!" He needs must worship her more than ever, and own that none can rival her adorable and "infinite variety."

No; the only consistent revolt is on the part of those who declare that she has no real existence—that beauty is a chimera. Let me confess at once that I am not in their ranks. I doubt whether any artist, or any thinker who honestly loves art and has an instinct for it, believes this theory of esthetics, though he may advocate it or be driven into its acceptance. An argument can be made on that side, granting certain premises. Even then it is a dispute about terms. The claim may serve for metaphysicians, not for those whose vocations relate to the expression of artistic ideas in what is called tangible form. Go back to Berkeley and his forebears, if you like. Deny the existence of all things—for that is what you must do if you deny the actuality of beauty, else you are instantly routed. Your only safe claim is that naught but soul exists, and this not the general soul, but your own soul, your Ego. You think, therefore you are; everything else is, for all that I can prove, the caprice of your own dream. Some of our modern transcendentalists, vaunting their Platonic allegiance to ideal beauty, affected indifference to its material emblems. The modern impressionists, after all the most ardent and ingenuous of technicians, are unwittingly their direct successors. Now, the transcendentalists often were speculators, and not, as they deemed themselves, artists and poets. Having little command over the beautiful, they took refuge in discrediting it. I speak of certain of the followers: their chief was Argus-eyed. In Emerson the true poet constantly broke loose. He, too, looked inward for the ideal beauty, that purest discovery of the soul, but in song he always recognized its visible reality.

For Nature beats in perfect tune,  
And rounds with rhyme her every rune,  
Whether she work in land or sea,  
Or hide underground her alchemy.  
Thou canst not wave thy staff in air,  
Or dip thy paddle in the lake,  
But it carves the bow of beauty there,  
And the ripples in rhymes the oar forsake.

But, as I say, the recantation of beauty, by transcendentalists, realists, and impressionists alike, is the search for her in some other of her many realms. Whatsoever kingdom the impressionist enters, he still finds her on the throne. For him she may veil herself in twi-

light and half-tints — or at rare instants of perception in still more witching drapery worn for him alone. The individual impressions enrich our museum of her portraitures. The impressionist depicts her not as she was known to Pheidias, or Raphael, or Velasquez, but as she appears to his own favored vision. This is the truth that makes impressionism a brave factor in modern art and poetry. What lessens its vantage is the delusion, absurd as Malvolio's, of incompetents, each of whom fancies that he is in special favor and that myopic vision and eccentric technic result in impressions that are worth recording.

WHENEVER there is a notable break from that mediocrity falsely termed "correct," which lurks in academic arras, it is not a rebellion but a just revolution. This is why it has been said that "the strength of Shakspeare lay in the fact that he had no taste; he was not a man of letters." But men of letters now accept Shakspeare as their highest master. Thus every new movement or method in art has the added form of strangeness at first — of a true romanticism. In time this too becomes classicism and academic. The mediocrities, the dullards of art, are ever the camp-followers of its shining soldiery. In every campaign, under every mode that a genius brings into vogue, they ultimately pitch their ragged tents; and even if they do not sink the cause into disrepute, they make in time a new departure necessary. In the greatest work, however, there will be found always a fresh originality that is not radically opposed to principles already established; you will have a union of classicism and romanticism.

Any poem or painting which produces a serious and lasting impression will in the end be found to have a beauty, not merely of its own, but allied to universal types and susceptible of logical analysis. Its royal stamp will be detected by the expert. Gainsay this, and you count out a host of the elect brotherhood who make this the specific test — who will forego other elements (as in religion the Church passes over minor matters if you accept its one essential) and concentrate their force upon the dogma tersely expressed by Poe when he defined poetry as "the rhythmical creation of beauty." One need not accept this as a sufficient statement, but one may assert that no statement is sufficient which does not pointedly include it.

Confront, however, the fact that the new esthetic is grounded in science, and see to what this leads. It opposes, for example, the theory of those who accept the existence of a something which we recognize as beauty, and which as a sensible and primary quality can be defined only by itself, or by a synonym, though

its conditions are observable and reasons can be given for it. Expression is its source; is not beauty itself, but that which gives objects beauty. Now Véron, a forcible expositor of the school that has in mind the scientific situation, declares that beauty is solely in the eye or mind of the artist, and that everything turns on the expression of his impression. The latter clause is true enough. The beauty which the painter or poet offers us certainly depends upon the quality of his vision, upon his ability to give us something in accord with general laws, yet deriving a special charm and power from the touch or atmosphere of his personal genius. As each race has its specific mode of vision, so for each there are as many and different impressions and expressions as the race has artists; and the general or academic outlines of perfection being known, the distinctive value of a poem or painting does come from its maker's habit of vision and interpretation.

But why, in order to advance the banner of impressionism, or of realism, good as these may be, should we assume the task of denying beauty altogether? Beauty is confessedly not a substance; you cannot weigh it with scales or measure it with a yard-stick: but it is a vibratory expression of substances. It characterizes that substance which enforces upon intelligence — in our case, upon human intelligence — a perception of its fitness. In the mind of a creative poet, it is a quality of his imagined substance — poetry dealing, as we have seen, with "the shews of things" and treating them as if real. To the pure idealist they are the only realities, as Emerson himself implied in his remark when called away from an abstract discussion in the library to inspect a farmer's load of wood: "Excuse me a moment, my friends. We have to attend to these matters just as if they were real."

To be sure, from the place where I stand, I cannot see the rays, the vibrations, which convey to you the aspect of something in your line of vision; the light and shape and color which constitute your impression are your personal sensations. But the vibrations which produce them are actually occurring, and the quality of the substance from which they emanate is operative, — unless, again, you choose to deny *in toto* the existence of matter, — and, after every allowance has been made for personal variation, if I move to your point of view, they will, so far as we can know anything, produce approximately the same effect upon my mind and upon yours. It matters not through which of the senses impressions are received: sight, hearing, smell, taste, touch — all resolve themselves at last into spiritual feeling. Form, for example, appeals to the touch as well as to the eye. Note the blind Herreshoff, that skilled designer of

the swift, graceful hulls of yachts and other cruisers. As his sensitive fingers passed over, and shaped, and reshaped his model, he had as keen a sense of the beauty of its lines as we have in seeing them. A poem, conveyed by touch to one congenitally deaf, dumb, and blind, will impress him only with the beauty of its thought, construction, and metric concordance; but in one who has lost his sight and hearing in mature years, and who retains his memories, it will excite ideas of sound and imagery and color. Moral and intellectual beauty is the spiritual analogue of that which is sensuous; but just now we are regarding concrete qualities; for example, the form, the verbal and rhythmical excellence, of a poet's poem. Our reference to arts that specially appeal to the eye is illustrative, since they afford the diagrams, so to speak, of most service in this discussion.

For the perception of the beautiful there must be a soul in conjunction; that statement is irrefutable. Yet I think that the quality of beauty exists in substances, even if there be no intelligence at hand to receive an impression of it; that if a cataract has been falling and thundering and prismatically sparkling in the heart of a green forest, from time immemorial, and with no human being to wonder at it, it has no less the attribute of beauty; it is waiting, as Kepler said of its Creator, "six thousand years for an interpreter." Suppose that an exquisite ode by Sappho or Catullus has been buried for twenty centuries in some urn or crypt: its beauty is there, and may come to light. Grant that our sense of material beauty is the impression caused by vibrations; then *the quality regulating those vibrations* is what I mean by the "beauty" of the substance whence they emanate. Grant what we term the extension of that substance; the characteristics of that extension are what affect us. There is no escape, you see, unless, with Berkeley, you say there is no matter.

This is just what the poet, the artist, is not called upon to do. He is at the outset a phenomenalist. He sets forth his apparitions of things, idealizing them for the delight of himself and the world. And as to the law of beauty, whether it lies in use or proportion or what not, it all comes back to the truths of nature, to the perfection of the universe, to that sense of the fitness of things which is common to us all in our respective degrees; so that there are some objects so perfect that we all, if of the same breed and condition, assent to their beauty. There are women, for example, who take the world with beauty at first glance, and there are other objects only partly beautiful, less perfect, about which, therefore, even critical judgments are in dispute. That beauty does go somewhat with use is plain from its creation by necessity. The vessel that is most

beautiful, that differs most from the lines of a junk or scow, is the one best fitted safely and swiftly to ride the waves. The condition is the same with everything in nature and art, from a bird to a portico. If the essence of beauty lies in conformity to the law and fitness of things, then all natural things are as beautiful as they can be—that is, beauty is their natural quality; they develop it unconsciously as far as possible under limitations imposed by the pervading struggle for existence. This is what leads Hartmann to assert that in Nature's beauty "the individual, who is at the same time marble and sculpture, realizes the Idea perfectly unconsciously; in human artistic production, on the other hand, the instigation of consciousness supervenes."

The poet, through intuition and executive gift realizing the normal beauty of everything, imaginatively sets it forth. He detects it even within the abnormal gloom and deformity imposed by chance and condition, helps it to struggle to the light, restores it—I may say—to consonance with the beauty of the universal soul. This being partly comprehensible through empiricism and logical analysis, men of talent, and of little insight, produce tolerable work by means of trained esthetic judgment. But no art, no poetry, is a distinctive addition to the world's stores unless its first conception be intuitive; then only it is a fresh expression of the universal beauty through one of its select interpreters. Like all things else it comes to us from Jove.

Even Véron is compelled to assume the element which he denies. When he begins to illustrate and to criticize, he instantly talks of "the perfection of parts." The despotism of established art systems springs from this perfection—the academic sway of the antique and of Raphaelitism. Much of this discussion belongs to metaphysical esthetics, and some persons may think these notions antiquated. We know little of these things absolutely. We know not the esoteric truth in matters of art or nature—otherwise the schools at once would cease their controversies. As it happens, certain of the latest physicists claim that "deduced facts"—that is, the objects inferred from our sensations—are the true substantialities; that only our perception of them is transient; that the world of subjective feelings is the chimera, not the objective matters which excite perception.

One question you very properly may ask: "Why not take all this for granted, and go on? Join either side, and the result is the same. Eclipses were calculated readily enough upon the Ptolemaic method." Not so. The theory that beauty is a chimera leads to an arrogant contempt for it on the part of many artists and poets, who substitute that which is bizarre and

audacious for that which has enduring charm. It begins with irreverence, and leads to discordant taste; to something far beneath the excellence of noble literatures and of great plastic and poetic eras.

THE tentative revolts that break forth in art and letters are against methods to which, however fine they be and grounded in nature, the world has become too servile. Movements in poetry, like those of Blake and Whitman and Lanier for greater rhythmical freedom, of the Rossetians for a study of Preraphaelite methods, of Banville and Dobson for a restoration of attractive forms; movements in art like those of Monticelli and Monet—all these are but the quest for values so long unwonted that they seem new; and thus art returns upon its circuit and the wisdom of the Preacher is reaffirmed. Still, every race has its culminating or concurrent ideal of beauty, which is affected, again, by the conditions of life in the different regions of the race's establishment. Each nation, like a rose-tree, draws from the soil and air its strength, and wealth, and material sustenance; it puts forth branches, and leaves, and sturdy thorns, and battles with the elements and with the thicket that hems it in; finally, with all its hardier growth assured, it breaks into flower, it develops an ideal; its own and perfect rose of beauty marks the culmination, the intent, the absolute fulfilment, of its creative existence. Thus the ideals of Grecian art and song doubtless represent the South, and those of the Gothic or romantic the North, in Europe; and the two include the rarest of our Aryan types. In art, these have resulted in various academic standards the excellence of which cannot be discredited. Pater has rightly said that it is vulgar to ignore the "form" of the one, and vulgar to underrate the "substance" of the other. The charm of the antique, for instance, is so celestial that, supposing we had been deprived of it hitherto and were suddenly to be introduced to it through discovery of a new continent, the children of art would go wild over its perfection. The very artists who now revolt from it would in that case break from other standards and lead a revolt in its favor, and a momentous progress in art and song would be recorded. As it is, we are intellectually aware of its nobility; but anon our sense of delight in it is blunted,—we have no zest in its repetition, being to the manner born. Zest is the sensation most worth possessing. The eager student instinct is right in essaying discovery and revival, since only thus can zest be sustained, and, for the sake of this, occasional changes even to fashions of minor worth are not to be scouted. The element of strangeness itself conveys a peculiar effect of beauty. This, by the way, is the

strength of the Grotesque, a subordinate form of art and at its best accessory.

You will observe that after most revolts the schools go back, in time, to certain ideals—to those which become academic because the highest. They recover zest for these, having wearied of some passing fashion or revival. An occasional separation is not a bad thing, after all, in friendship, art, or marriage. Thus it was that the classic Renaissance of Italy reopened a world of beauty, and began a fresh creative period, in which new styles of painting, molding, architecture arose, different from the antique, but inspired by it, and possible because the spirit of beauty itself was reborn.

We constantly have illustrations of the dependence of artistic zest upon the stimulus of novelty. Some of you possibly were brought up in our old towns and in those old houses where architecture, furniture, wall-paper, were all "in keeping." How prim and monotonous it then seemed, and how a lad longed to get away from it! Cited folk long since got away, and with zest, to something vastly inferior—to something with no style at all. At last the Colonial and Revolutionary homestead styles became rare to find in their integrity. Now we see a restoration of them; now we rediscover their lightness and fitness,—their beauty,—and are reviving them in all departments of taste; until in fact, as I recently heard an artist break forth, "there is a great deal of taste—and some of it is good!" It may be that another generation will tire of them, as we did, though it seems heresy to say so now.

For a long time after 1775, Sir Joshua Reynolds stood, in his work and "Discourses," as a representative exponent of the academic. One must remember that he had no light task in promoting taste among his Anglo-Saxons; their race is not endowed with the intuitive Southern perception of the beautiful. The English acquire their artistic taste intellectually, except in landscape-gardening, although their poets seem to be even more noble (perhaps because more intellectual) than those of nations whose sense of material beauty is congenital. Sir Joshua was a good deal of a poet with his brush. The chief of academicians, he had a touch, a lovely feeling, an impressiveness of his own. When he sought a foundation for his discourses upon art, he wisely went to the best ideals known to him. His lectures are in the main sound; no artist, even a recanter, can afford not to read them; yet the attempt to carry them out almost confirmed the English School in "correct," rigid, and lifeless methods. And why? Because Sir Joshua, an original painter in his studio, in his teachings did not sufficiently allow for and inculcate a local, cli-

matic, racial divergence from his revered Italian models.

Now, the Indo-European ideals of beauty usually have been the foundation of academic theoretics upon art, just as they are interwrought, in sooth, with English poetry, and with the great criticism thereon—from Lamb and Coleridge to Dryden and Arnold and Lowell. But what would Sir Joshua Reynolds have made of the extreme antipodal type, that of those Asiatic Greeks—our delightful Japanese? To be sure, there were Indian and Chinese cults, but these were merely capricious and accessory, and not pursued to any just appreciation of their ideals. Here, then, in Japan is a race developed under distinctive biological conditions, with types of art and life almost the reverse of our own, yet perfectly consistent throughout, and—as we now see—superior to those of Western civilization in more than one department. Its ideals are just as perfect as those of the Greeks or Goths, yet absolutely different. Here we indeed enter a new world. Ideal beauty plainly lies in adaptation of the spirit to the circumstances, though not always to the apparent material exigencies. La Farge, whom I have before quoted,—and upon the subject of beauty the sayings of a painter or an architect (*mutatis mutandis*) apply just as fully to poetry as to his own art,—La Farge says, in speaking of the adaptation of Japanese buildings to resistance against earthquakes, that

like all true art, the architecture of Japan has found in the necessities imposed upon it the motives for realizing beauty, and has adorned the means by which it has conquered the difficulties to be surmounted.

No better illustration could be given of the relations of fitness and beauty; but he soon has occasion to add:

Everywhere the higher architecture, embodied in shrines and temples, is based on some ideal needs, and not essentially upon necessities.

We see, then, every people recognizing an extramundane conception of beauty, founded in the spirit of man, and this again conforms itself to the spirit of each race. Through it the poets become creative rather than adaptive—the beauty of their imaginings coming from within, just as the beauty of nature is the efflux of the universal spirit. So far as human artists share the Divinity of that spirit, their interpretations give it form to human eyes, melody to human ears, and imagery and feeling therewithal to move the recipient. It seems, then, I say, the lot of each nation, as if an individual, and of each period, as if a modish season, to discover the beauty conformed both to general laws and to specific needs and impulse; to

create, moreover, its proper forms in every art, thus making new contributions to the world's thesaurus of poetry and design. This is acknowledged by all, as concerns the every-day art of dress. A Japanese gentleman is dignified in his national costume; his wife and daughters are charming in their clinging and curving robes. Attire them—and that is the shameful thing which our Western invasion is effecting—in the dapper broadcloth, the Parisian gown, and their comeliness is gone. A pitiful incongruity takes its place. I believe that such a race as theirs also develops its fine arts, manners, government, literature—yes, even religion—to its foreordained capacity; that if you force or coax it to adopt the modes of a divergent people, you sound the death-knell of its fair individuality. If the tempter race is the superior, the one that surrenders its own ideals is doomed to be absorbed—at least, to lose its national distinction. Possibly with the progressive modern intercourse of peoples a general blending is to result. Languages, arts, races, may react upon one another and produce a cosmic mongrelism. If this is according to the law of progress, something grand will come out of it, a planetary and imposing style. But during centuries of transition the gradual loss of national individualities will seem pathetic indeed. Something of this passed through my mind as I watched, half sorrowful and half amused, an accomplished Japanese lady, the adopted daughter of an American, yielding to the influence of our Western ideals. A natural artist, like so many of her blood, she is impressible by beauty of a novel type. As far as personal experience is concerned, she doubtless adds to the worth of her own life by assimilating the results of an art no more perfect in its kind than the decorative—and therefore secondary—art of her own race, yet one far beyond the power of her race to originate, or to pursue in competition with its originators. Therefore it seemed almost a pity to find her at work upon a lesson from the Art Students' League, copying in crayon an antique Apollo, with deft fingers, which to my thinking should be tracing designs in lacquer or in cloisonné on bronze, or painting some group of Japanese men and maidens, in their flexible costume, by the bayside, on a terrace, with herons stalking among sacred lilies in the near distance, and the eternal peak of Fujiyama meeting the blue sky beyond.

Meanwhile our present standard of beauty is the European, with modifications. To comprehend any other you must enter into its spirit by adoption, by a certain naturalization; until then you will find it as hard to master as the idioms of a language not your own. These seem grotesque and childish until you speak,

even think, in their tongue without mentally translating it. A translation will give you the imagination, action, thought, of a poem, for instance, but not its native and essential beauty. Esthetics relate to the primal sense, and must be taken at first hand. This is all the truth there is in the maxim *De gustibus*. If the rays of our sun were as green as those of the star  $\beta$  Libræ, beauty would exist and have its standard in conformity. Taste would be as intuitive as now, and just as open to cultivation.

THESE general principles should entitle us to our surmise respecting the ultimate value of a poem. A mode attractive for its novelty may be only the vogue of a generation, or of a brief season. I take endurance to be the test of art. History will show, I think, that if a poem had not the element of beauty, this potency in art, its force could not endure. Beauty partakes of eternal youth and conveys its own immortality. Passion and imagination intensify much of the poetry that has survived; but under their stress the poet summons beauty to his aid. Wisdom and morals do not so inevitably take on grace; their statements, impressive at the time, must be recast perpetually. The law of natural selection conserves artistic beauty in the poem as in the bird and butterfly. Besides, just as gems and gold are hoarded while iron is left to rust, and as paintings that are beautiful in line and color grow costlier with time, so the poetry that has the beauty of true art becomes the heirloom of generations. For beauty seems to consecrate both makers and possessors. Just as all the world clings to the legends of Helen and Cleopatra and Mary Stuart, so it has a fondness for the Cellinis and Villons and Marlowes and Lovelaces—the ne'er-do-weels of art and song. This is because it reads the artist's higher self in his work; there alone it is expressed, and we give him credit for it. The truth of fairy tales is that of beauty; the Florizels and Cinderellas and Percinets are its ideals. Beauty loves the Beast, but the Beast is beauty in disguise. Thus creative taste holds the key to the future, and art for art's sake is a sound motto in so far as beauty is a legitimate end of art. That it is not the sole end of art-life is the lesson of Tennyson's "The Palace of Art." One who thought otherwise at last found need to throw her royal robes away:

"Make me a cottage in the vale," she said,  
"Where I may mourn and pray.

"Yet pull not down my palace towers, that are  
So lightly, beautifully built:  
Perchance I may return with others there  
When I have purged my guilt."

All in all, if concrete beauty is not the greatest thing in poetry, it is the one thing indispensable,

and therefore we give it earliest consideration. Besides, it so depends on the elements of emotion and truth that when these are not expressed in a poem you may suspect the beauty to be defective and your sense of it mistaken. It may be said to symbolize truth in pure form.

The young poet, as instinctively as a plant seeks the light, feels that he must worship and express the beautiful. His passion for it, both in his life and in his art, is his greatest strength and danger. It is that which must distinguish him from other men; for many will have more wisdom, more virtue, than himself, while only he who can inform these with beauty by that token is the poet. In the early poems of Shakspeare, Milton, Goethe, Tennyson, Rossetti, thought is wreaked "upon expression." Even the minstrels whose development stops at this point, such as Herrick, the cavalier singers, the Provençal minstrels, have no obscure stations in the hemicycle of song.

WHY is it that all the relics of Grecian poetry have such beauty? Were there no dulcitudes, was there no inartistic versifying, even in Athens? It is my belief that for every poet whose works have reached us a score passed into obscurity, and their writings were lost; furthermore, that, in spite of the burning of the Alexandrian library, comparatively little has been lost since the time of Herodotus that was worth saving. Only the masterpieces, large and small, were copied and recopied, and treasured in men's hearts and homes. And those were. The ugly statues, also, went to ruin. It is the Venus of the Louvre that is piously buried when danger threatens, whether in Melos or by the Seine; and it is she who always rises again and comes to light. Doubtless we have the most beautiful dramas of even Æschylus and Sophocles, and some of the rarest odes of even Æolian and Dorian lyrists. Time and fate could not destroy the blooms of the anthology, the loveliest Syracusan idyls, the odes of Catullus and Horace. By chance something less attractive has remained: we keep Ausonius and Quintus on the archaic shelves, but they have no life; they are not cherished and quoted, they cannot be said to endure.

All service is in a sense acceptable, and hence the claim that the intent, rather than the outcome, crowns the work. Thus Browning in his paper on Shelley and in certain poems shows himself to be a pure idealist in his estimate of art. Professor A. H. Smyth explains that the object of Browning's "Old Pictures in Florence" is "to show that Greek art in all its matchless perfection is no more admirable than dim and almost undecipherable ruins of efforts merely monastic, on smoke-stained walls of Christian churches." But to me the latter

suggest merely faith and aspiration, without that perfected beauty which adds the grandeur of attainment and completes the trinity of art.

The poetry of our own tongue is sufficient to test the law of durability. Its youth, as if that of a poet, was pledged to the mastery of the beautiful as soon as it grew out of half-barbaric minstrelsy and displayed a conscious intent. Chaucer is a poet of the beautiful; always original in his genius, and sometimes in his invention, he for the most part simply tells old tales with a new and English beauty. Five hundred years later his pupil, Morris, renews the process. Spenser's rare and exhaustless art makes him the poet's poet. Passing by Shakspeare as we would pass by nature, what we call again and again from the Elizabethan garden are those passages in the dramatists, beautiful for rhythm and diction, which furnish examples for the criticism of Coleridge and Lamb. From the skylark melodies and madrigals of that English Arcady those which are most beautiful are ever chosen first by the anthologists. We never tire of them: they seem more perfect and welcome with each remove. Too few read Ben Jonson's plays; who does not know "To Celia," "The Triumph of Charis," and "Drink to Me Only with Thine Eyes"? The song, "Take, O take those lips away," even were it not embalmed by Shakspeare, would outlast the dramas of John Fletcher. Suckling's "Why so pale and wan, fond lover?" and his verses on a wedding, Lovelace's "To Lucasta" and "To Althæa, from Prison,"—such are the gems in whose light the shades of courtier-poets remain apparent. More of Herrick's endure, because with him beauty of sound and shape and fancy was always first in heart, and always fresh and natural. I have written a paper on Single-Poem Poets, but the greater number of them were no less the authors of a mass of long-forgotten verse. Of Waller's poetry we remember little beyond the dainty lyrics "Go, Lovely Rose" and "On a Lady's Girdle." From time to time the saddest and gladdest and sweetest chansons of Villon and Ronsard and Du Bellay are retranslated by deft English minstrels, as men take out precious things from cabinets and burnish them anew. A ponderous epic disappears: some little song, once carried by Mary Stuart, or a perfect conceit of imagery and feeling, whose very author is unknown, becomes imperishable. For instance,

THE WHITE ROSE.

*Sent by a Yorkish Lover to his  
Lancastrian Mistress.*

If this fair rose offend thy sight,  
Placed in thy bosom bare,  
'T will blush to find itself less white  
And turn Lancastrian there.

But if thy ruby lip it spy,  
As kiss it thou mayest deign,  
With envy pale 't will lose its dye,  
And Yorkish turn again.

The few lyrics I have named are among the most familiar that occur to you and me; but what has made them so if it be not their exceeding loveliness?

We have but one poet of the first order, but one strong pier of the bridge, between Shakspeare and our own century. Milton in his early versé, which has given lessons to Keats and Tennyson, displays the extreme sense and expression of poetic beauty. Dryden and Pope have values of their own; but from Pope to Burns, only Goldsmith, for his charms of simplicity and feeling, and Collins and Gray, who achieved a certain perfection even in conventional forms, are still endeared to us. Examine the imposing mass of Wordsworth's poetry. With few exceptions the imaginative and elevated passages, the most tender lyrics, have a peculiar beauty of rhythm and language—have sound, color, and artistic grace. Take these, and nearly all are chosen for Arnold's "Selection" and Palgrave's "Golden Treasury," and you possibly have the most of Wordsworth that will be read hereafter.

A revival of love for the beautiful culminated in the modern art school. Naturalness had come back with Burns, Cowper, and Wordsworth, intensity and freedom with Byron; then the absolute poetic movement of Coleridge, Shelley, Keats, and of that esthetic propagandist, Leigh Hunt, began its prolonged influence. Poetry is again an art, constructed and bedecked with precision. So potent the charm of this restoration, that it has outrun all else: there is a multitude of minor artists, each of whom, if he cannot read the heart of Poesy, casts his little flower beside her as she sleeps. Who can tell but some of these blossoms may be selected by Fame and Time, that wait upon her? *Ars Victrix* wears her little trophies as proudly as her great. Dobson's paraphrase on Gautier became at once a proverb, from instant recognition of its truth:

All passes. Art alone  
Enduring stays to us;  
The Bust outlasts the throne,—  
The Coin, Tiberius;

Even the gods must go;  
Only the lofty Rhyme  
Not countless years o'erthrow,—  
Not long array of time.

In this one lecture, you see, I dwell upon the technical features that lend enchantment to poetry in the concrete. How, then, does the beauty of a poem avail? Primitively, as ad-

dressed to the ear in sound; that was its normal method of conveying its imagery and passion to the human mind, and we have already considered the strange spell of its vocal music. But with the birth of written literature it equally addressed the eye, and since the invention of printing, a thousand times more frequently; so that the epigram is not strained which declares that "It is read with the ear; it is written with the voice; it is heard with the eyes." The mind's ear conceives the beauty of those seen, but "unheard melodies," which are "the sweetest." The *look* of certain words conveys certain ideas to the mind; they seem as entities to display the absolute color, form, expression, associated with their meanings, just as their *seen* rhythm and melody sound themselves to the ear. The eye, moreover, finds the architecture of verse effective, realizing a monumental, inscriptionary beauty in stanzaic and ode forms. Shape, arrangement, proportion, compose the synthetic beauty of Construction. Thus poetry has its architecture and shares that condition celebrated by Beatrice in the "Paradiso": "All things collectively have an order among themselves, and this is form, which makes the universe resemble God."<sup>1</sup> Beauty of construction is still more potent in the effect of plot and arrangement. Simplicity, above all, characterizes alike the noblest and the loveliest poems—simplicity of art and of feeling. There are no better examples of this, as to motive and construction, than those two episodes of Ruth and Esther. Written in the poetic Hebrew, though not in verse, they fulfil every requisition of the prose idyl: the one a pure pastoral, the other a civic and royal idyl of the court of a mighty king. There is not a phrase, an image, an incident, too much or too little in either; not a false note of atmosphere or feeling. These works, so naively exquisite, are deathless. Their charm is even greater as time goes on. Now, a remarkable novel has been written in our own day, "Anna Karénina," which chances to be composed of two idyls—one distinctly of the city and the court, the other of the country and the harvest-field. These two cross and interweave, and blend and separate, until the climacteric tragedy and lesson of the book. Powerful as this work is, it has little chance of great endurance, inasmuch as its structure and detail are complex even for this complex period. It is at the opposite extreme from the simplicity of those matchless idyls of the Old Testament.

In poetry true beauty of detail is next to that of construction, but non-creative writers lavish all their ingenuity upon decoration until

it becomes a vice. You cannot long disguise a lack of native vigor by ornament and novel effects. Over-decoration of late is the symptom of over-prolonged devotion to the technical sides of both poetry and art. Sound, color, word-painting, verse-carving, imagery—all these are rightly subordinate to the passion of a poem, and must not usurp its place. Landscape, moreover, at its best, is but a background to life and action. In fine, construction must be decorated, but decoration is not the main object of a building or a poem. "The Eve of St. Agnes" is perhaps our finest English example of the extreme point to which effects of detail can be carried in a romantic poem. The faultless construction warrants it. Some of Tennyson's early pieces, such as the classic-romantic "Ænone" and "The Lotos-Eaters," stand next in modern verse. But I forego a disquisition upon technic. All of its countless effects are nothing without that psychical beauty imparted by the true poetic vitality—are of less value than faith and works without love. The *vox humana* must be heard. That alone can give quality to a poem; the most refined and artistic verse is cold and forceless without it. A soulless poem is a stained-glass window with the light shining on and not through it.

Since a high emotion cannot be sustained too long without changing from a rapture to a pang, many have declared that the phrase "a long poem" is a misnomer. Undoubtedly, concentration of feeling must be followed by depression or repose. The fire that burns fiercely soon does its work. Yet he who conceives and makes a grand tragedy or epic so relieves his work with interludes and routine that the reader moves as from wave to wave across a great water. It may be, as alleged, a succession of short poems, but these are interwrought as by one of nature's processes for the building of a master-work. However, let me select the beauty of a short and lyric poem, as the kind about which there is no dispute, for the only type which I can here consider.

Lyrical beauty does not necessarily depend upon the obvious repetends and singing-bars of a song or regular lyric. The purest lyrics are not of course songs; the stanzaic effect, the use of open vowel sounds, and other matters instinctive with song-makers, need not characterize them. What they must have is *quality*. That their rhythmic and verbal expression appeals supremely to the finest sensibilities indicates, first, that the music of speech is more advanced, because more subtly varying, than that of song; or, secondly, that a more advanced music, such as the German and French melodists now wed to words, is required for the interpretation of the most poetic and qualitative lyric. A profound philosophy of sound and

<sup>1</sup> Thus cited by Dr. W. T. Harris in "The Spiritual Sense of Dante's Divina Commedia."

speech is here involved—not yet fully understood, and into which we need not enter.

But you know that rare poetic types, whether of the chiseled classic verse or of the song and lyric, have a grace that is intangible. There is a rare bit of nature in "The Reapers" of Theocritus. Battus compares the feet of his mistress to carven ivory, her voice is drowsy sweet, "but her air"—he says—"I cannot express it!" And thus the gems of Greek and Latin verse, the cameos of Landor and Hunt and Gautier, the English songs from Shakspeare to Procter and Tennyson and Stoddard, the love-songs of Goethe and his successors, the ethereal witching lyrics of Shelley and Swinburne and Robert Bridges—all these have one impalpable attribute, light as thistle-down, potent as the breath of a spirit, a divine gift unattainable by will or study, and this is, in one word, Charm. Charis, Grace herself, bestows it, blending perfect though inexplicable beauty of thought with perfect though often suggested beauty of feeling. To these her airy sprites minister with melody and fragrance, with unexpectedness and sweet surprises, freedom in and out of law, naïveté, aristocratic poise, lightness, pathos, rapture—all gifts that serve to consecrate the magic touch. However skilled the singer, quality and charm are inborn. Something of them therefore always graces the folk-songs of a peasantry, the ballads and songs, let us say, of Ireland and Scotland. Theirs is the wilding flavor which Lowell detects:

Sometimes it is  
A leafless wilding shivering by the wall;  
But I have known when winter barberries  
Pricked the effeminate palate with surprise  
Of savor whose mere harshness seemed divine.

When to this the artist-touch is added, then the wandering, uncapturable movement of the pure lyric—more beautiful for its breaks and studied accidentals and most effective discords—is ravishing indeed: at last you have the poet's poetry that is supernal. Its pervading quintessence is like the sheen of flame upon a glaze in earth or metal. Form, color, sound, unite and in some mysterious way become lambent with delicate or impassioned meaning. Here beauty is most intense. Charm is the expression of its expression, the measureless under-vibration, the thrill within the thrill. We catch from its suggestion the very impulse of the lyrist; we are given the human tone, the light of the eye, the play of feature—all, in fine, which shows the poet in the poem and makes it his and not another's.

Just as this elusive beauty prevails, the song, or lyric, will endure. Art is in truth the victress when she fulfils Ruskin's demand and is able

"to stay what is fleeting, and to enlighten what is incomprehensible; to incorporate the things that have no measure, and immortalize the things that have no duration." And yet, recognizing her subtle paradox, and if asked to name one suggested feeling which more than others seems allied with Charm and likely to perpetuate its expression (for I can name only one to-day), I select that which dwells not upon continuance, but upon—our perishableness. Think of it, and you will see that Evanescence is an unfailing source of charm. Something exquisite attaches to our sense of it. The appeal which a delicate and fragile thing of beauty makes to us depends as much upon its peril as upon its rarity. In the fullness of life we may have other things as fair and cherished; but that one individuality, that grace and sweetness, cannot be repeated. In time we must say of it—

Like the dew on the mountain,  
Like the foam on the river,  
Like the bubble on the fountain,  
Thou art gone, and forever!

We marvel at the indestructible gem, but love the flower for its share in our own doom. If the violet, the rose-gerardia, the yellow jasmine, were unfading, imperishable, what would their worth be? Mimic them exactly in wax, reproduce even their fragrance, and the copies smack of embalment. We have, indeed, blooms that do not wither, that do not waste themselves in exhalations; we call them immortelles, but we feel that these amaranthine, husky blossoms are emblems not of life but of death; they cannot have souls, else they would not be so changeless. Not theirs

The unquiet spirit of a flower  
That hath too brief an hour.

The ecstatic charm of nature lies in her evanishments. Each season is too fair to last; no sunrise stays; "the rainbow comes and goes"; the clouds change and fleet and fade to nothingness. The height of wisdom is to make the most of life's best moments, to realize that "it is their evanescence makes them fair." So it is with all mortal existence: we idealize the unalterable fact of its mortality. Time passes like a bird, joy withers, even Love dies, and the Graces ring us to his burial. We ask, with the Hindu Prince, concerning life,

Shall it pass as a camp that is struck, as a tent  
that is gathered and gone  
From the sands that were lamp-lit at eve, and at  
morning are level and lone?

We ask with sighs and tears, but would we have it otherwise? If Poe was wrong in restricting

poetry to the voices of sorrow and regret, he was right, methinks, in feeling these to be among the most effectual of lyrical values. The word *Irreparable* suggests a yearning as infinite as that for the Unattainable, under the spell of which Richter fled as from a passion too intense to bear. Yes; the sweetest sound in music is "a dying fall." "Mimnermus in Church" weighs the preacher's adjuration, and makes an impetuous reply :

Forsooth the present we must give  
To that which cannot pass away !  
All beauteous things for which we live  
By laws of time and space decay.  
But oh, the very reason why  
I clasp them is because they die.

Among priceless lyrics from the Greek anthology to our own, those of joy and happy love and hope are fair indeed, but those which haunt the memory turn upon the escape — not the retention — of that which is "rich and strange." Their charm is poignant, yet ineffable. The consecration of such enduring melody to regret for the beloved, whose swift, inexplicable transits leave us dreaming of all they might have been, is the voice of our desire that their work, even though perfecting in some unknown region, may not wholly fail upon earth — that their death may not be quite untimely.

How subtle the effect, even in its English rendering, of Villon's "Ballade of Dead Ladies" — "Where are the snows of yester-year?" Are any lyrics more captivating than our English dirges: the song dirges of the dramatists — "Come away, come away, Death," "Call for the robin redbreast and the wren," "Full fathom five thy father lies," and the like? Collins's "Dirge for Fidele," a mere piece of studied art, acquires its beauty from a flawless treatment of the master-theme. Add to such art the force of a profound emotion, and you have Wordsworth in his more impassioned lyrical strains: "She dwelt among the untrodden ways," "A slumber did my spirit steal," and the stanzas on Ettrick's "poet dead." Landor's "Rose Aylmer" owes its spell to a consummate union of nature and art in recognition of the unavailability of all that is rarest and most lustrous:

Ah, what avails the sceptred race !  
Ah, what the form divine !  
What every virtue, every grace !  
Rose Aylmer, all were thine.  
Rose Aylmer, whom these wakeful eyes  
May weep, but never see,  
A night of memories and of sighs  
I consecrate to thee.

—Of memories and of sighs, yet not of pain, for such vigils have a rapture of their own. The perished have at least the gift of immortal love, remembrance, tears, and at our festivals the unseen guests are most apparent. Thus the tuneless plaint of sorrow, the tears "wild with all regret," the touch that consecrates, the preciousness of that which lives but in memory and echo and dreams, move the purest spirit of poesy to sweep the perfect minstrel lute. To such a poet as Robert Bridges the note of evanescence is indeed the note of charm, and in choosing the symbols of it for the imagery of his most ravishing song, he knows that thus, and thus most surely, it shall haunt us with its immortality :

I have loved flowers that fade,  
Within whose magic tents  
Rich hues have marriage made  
With sweet unmemoried scents —  
A honeymoon delight —  
A joy of love at sight,  
That ages in an hour :—  
My song be like a flower !

I have loved airs that die  
Before their charm is writ  
Along a liquid sky  
Trembling to welcome it.  
Notes that, with pulse of fire,  
Proclaim the spirit's desire,  
Then die and are nowhere :—  
My song be like an air !

Die, song, die like a breath  
And wither as a bloom :  
Fear not a flowery death,  
Fear not an empty tomb !  
Fly with delight, fly hence !  
'T was thine love's tender sense  
To feast, now on thy bier  
Beauty shall shed a tear.

*Edmund Clarence Stedman.*

# THE NAULAHKA.<sup>1</sup>

A STORY OF WEST AND EAST.

BY RUDYARD KIPLING AND WOLCOTT BALESTIER.

XXI.

O sit still, and to keep sitting still, is the first lesson that the young jockey must learn. Tarvin was learning it in bitterness of spirit. For the sake of his town, for the sake of his love, and, above all, for the sake

of his love's life, he must go. The town was waiting, his horse was saddled at the door, but his love would not come. He must sit still.

The burning desert wind blew through the open veranda as remorselessly as Sitabhai's hate. Looking out, he saw nothing but the city asleep in the sunshine and the wheeling kites above it. Yet when evening fell, and a man might be able by bold riding to escape to the railway, certain shrouded figures would creep from the walls and take up their position within easy gunshot of the rest-house. One squatted at each point of the compass, and between them, all night long, came and went a man on horseback. Tarvin could hear the steady beat of the hoofs as he went his rounds, and the sound did not give him fresh hope. But for Kate—but for Kate, he repeated to himself, he would have been long since beyond reach of horse or bullet. The hours were very slow, and as he sat and watched the shadows grow and shorten, it seemed to him, as it had seemed so often before, that this and no other was the moment that Topaz would choose to throw her chances from her.

He had lost already, he counted, eight-and-forty precious hours, and, so far as he could see, the remainder of the year might be spent in an equally unprofitable fashion.

Meantime Kate lay exposed to every imaginable danger. Sitabhai was sure to assume that he had wrested the necklace from her for the sake of the "frail white girl"; she had said as much on the dam. It *was* for Kate's sake, in a measure; but Tarvin reflected bitterly that an Oriental had no sense of proportion, and, like the snake, strikes first at that which is nearest. And Kate? How in the world was he to explain the case to her? He had told her of

danger about her path as well as his own, and she had decided to face that danger. For her courage and devotion he loved her; but her obstinacy made him grit his teeth. There was but one grimly comical element in the terrible jumble. What would the King say to Sitabhai when he discovered that she had lost the Luck of the State? In what manner would she veil that loss; and above all, into what sort of royal rage would she fall? Tarvin shook his head meditatively. "It's quite bad enough for me," he said, "just about as bad as it can possibly be made; but I have a wandering suspicion that it may be unwholesome for Juggut. Yes; I can spare time to be very sorry for Juggut. My fat friend, you should have held straight that first time, outside the city walls."

He rose and looked out into the sunlight, wondering which of the scattered vagrants by the roadside might be an emissary from the palace. A man lay apparently asleep by the side of his camel near the road that ran to the city. Tarvin stepped out casually from the veranda, and saw, as soon as he was fairly in the open, that the sleeper rolled round to the other side of his beast. He strolled forward a few paces. The sunlight glinted above the back of the camel on something that shone like silver. Tarvin marched straight toward the glitter, his pistol in his hand. The man, when Tarvin came up to him, was buried in innocent slumber. Under the fold of his garment peered the muzzle of a new and very clean rifle.

"Looks as if Sitabhai was calling out the militia, and supplying them with outfits from her private armory. Juggut's gun was new, too," said Tarvin, standing over the sleeper. "But this man knows more about guns than Juggut. Hi!" He stooped down and stirred the man up with the muzzle of his revolver. "I'm afraid I must trouble you for that gun. And tell the lady to drop it, will you? It won't pay."

The man understood the unspoken eloquence of the pistol, and nothing more. He gave up his gun sullenly enough, and moved away, lashing his camel spitefully.

"Now, I wonder how many more of her army I shall have to disarm," said Tarvin, retracing

his steps, the captured gun over his shoulder. "I wonder—no; I won't believe that she would dare to do anything to Kate. She knows enough of me to be sure that I'd blow her and her old palace into to-morrow. If she's half the woman she pretends to be, she'll reckon with me before she goes much further."

In vain he attempted to force himself into this belief. Sitabhai had shown him what sort of thing her mercy might be, and Kate might have tasted it ere this. To go to her now—to be maimed or crippled at the least if he went to her now—was impossible. Yet he decided that he would go. He returned hastily to Fibby, whom he had left not three minutes before flicking off flies in the sunshine at the back of the rest-house. But Fibby lay on his side groaning piteously, hamstrung and dying.

Tarvin could hear his groom industriously polishing a bit round the corner, and when the man came up in response to his call he flung himself down by the side of the horse, howling with grief.

"An enemy hath done this—an enemy hath done this!" he clamored. "My beautiful brown horse, that never did harm except when he kicked through fullness of meat! Where shall I find a new service if I let my charge die thus?"

"I wish I knew! I wish I knew!" said Tarvin, puzzled, and almost despairing. "There'd be a bullet through one black head, if I were just a little surer. Get up, you! Fibby, old man, I forgive you all your sins. You were a good old boy, and—here's luck."

The blue smoke enveloped Fibby's head for an instant, the head fell like a hammer, and the good horse was out of his pain. The groom, rising, rent the air with grief, till Tarvin kicked him out of the pickets and bade him be gone. Then it was noticeable that his cries ceased suddenly, and, as he retreated into his mud-house to tie up his effects, he smiled, and dug up some silver from a hole under his bedstead.

Tarvin, dismounted, looked east, west, north, south for help, as Sitabhai had looked on the dam. A wandering gang of gypsies with their lean bullocks and yelping dogs turned an angle of the city wall, and rested like a flock of unclean birds by the city gate. The sight in itself was not unusual, but city regulations forbade camping within a quarter of a mile of the walls.

"Some of the lady's poor relatives, I suppose. They have blocked the way through the gate pretty well. Now, if I were to make a bolt of it to the missionary's, they'd have me, would n't they?" muttered Tarvin to himself. "On the whole, I've seen prettier professions than trading with Eastern queens. They don't seem to understand the rules of the game."

At that moment a cloud of dust whirled through the gipsy camp, as the escort of the

Maharaj Kunwar, clearing the way for the barouche, scattered the dark band to the left and right. Tarvin wondered what this might portend. The escort halted with the customary rattle of accoutrements at the rest-house door, the barouche behind them. A single trooper, two hundred yards or more in the rear, lifted his voice in a deferential shout as he pursued the carriage. He was answered by a chuckle from the escort, and two shrill screams of delight from the occupants of the barouche.

A child whom Tarvin had never before seen stood upright in the back of the carriage, and hurled a torrent of abuse in the vernacular at the retreating trooper. Again the escort laughed.

"Tarvin Sahib! Tarvin Sahib!" piped the Maharaj Kunwar. "Come and look at us."

For a moment Tarvin fancied this a fresh device of the enemy; but reassured by the sight of his old and trusted ally, the Maharaj, he stepped forward.

"Prince," he said, as he took his hand, "you ought not to be out."

"Oh, it is all right," said the young man hastily, though his pale little face belied it. "I gave the order, and we came. Miss Kate gives me orders; but she took me over to the palace, and there I give orders. This is Umr Singh—my brother, the little Prince; but I shall be king."

The second child raised his eyes slowly, and looked full at Tarvin. The eyes and the low, broad forehead were those of Sitabhai, and the mouth closed firmly over the little pearl-like teeth, as his mother's mouth had closed in the conflict on the Dungar Talao.

"He is from the other side of the palace," answered the Maharaj, still in English. "From the other side, where I must not go. But when I was in the palace I went to him,—ha! ha! Tarvin Sahib,—and he was killing a goat. Look! His hands are all red now."

Umr Singh opened a tiny palm at a word in the vernacular from the Maharaj, and flung it outward at Tarvin. It was dark with dried blood, and a bearded whisper ran among the escort. The commandant turned in his saddle, and, nodding at Tarvin, muttered, "*Sitabhai kibeta!*" Tarvin caught the first word, and it was sufficient for him. Providence had sent him help out of a clear sky. He framed a plan instantly.

"But how did you come here, you young imps?" he demanded.

"Oh, there are only women in the palace yonder, and I am a Rajput and a man. He cannot speak any English at all," he added, pointing to his companion; "but when we have played together I have told him about you, Tarvin Sahib, and about the day you picked me out of my saddle, and he wished to come

too, to see all the things you show me, so I gave the order very quietly, and we came out of the little door together. And so we are here. *Salaam bolo, baba,*" he said patronizingly to the child at his side, and the child slowly and gravely raised his hand to his forehead, still gazing with fixed, incurious eyes on the stranger. Then he whispered something that made the Maharaj Kunwar laugh. "He says," said the Maharaj Kunwar, "that you are not so big as he thought. His mother told him that you were stronger than any man, but some of these troopers are bigger than you."

"Well, what do you want me to do?" asked Tarvin.

"Show him your gun, and how you shoot rupees, and what you do that makes horses quiet when they kick, and all those things."

"All right," said Tarvin. "But I can't show them here. Come over to Mr. Estes's with me."

"I do not like to go there. My monkey is dead. And I do not think Kate would like to see us. She is always crying now. She took me up to the palace yesterday, and this morning I went to her again; but she would not see me."

Tarvin could have hugged the child for the blessed assurance that Kate at least still lived. "Is n't she at the hospital, then?" he asked thickly.

"Oh, the hospital has all gone *phut*. There are no women now. They all ran away."

"No!" cried Tarvin. "Say that again, little man. What for?"

"Devils," said the Maharaj Kunwar, briefly. "What do I know? It was some women's talk. Show him how you ride, Tarvin Sahib."

Again Umr Singh whispered to his companion, and put one leg over the side of the barouche. "He says he will ride in front of you, as I told him I did," interpreted the Prince. "Gurdit Singh, dismount!"

A trooper flung himself out of the saddle at the word, and stood to attention at the horse's head. Tarvin, smiling to himself at the perfection of his opportunity, said nothing, but leaped into the saddle, picked Umr Singh out of the barouche, and placed him carefully before him.

"Sitabhai would be rather restless if she could see me," he murmured to himself, as he tucked his arm round the lithe little figure. "I don't think there will be any Juggutting while I carry this young man in front of me."

As the escort opened to allow Tarvin to take his place at their head, a wandering priest, who had been watching the episode from a little distance, turned and shouted with all the strength of his lungs across the plain in the direction of the city. The cry was taken up by unseen voices, passed on to the city walls, and died away on the sands beyond.

Umr Singh smiled as the horse began to trot, and urged Tarvin to go faster. This the Maharaj forbade. He wished to see the sight comfortably from his seat in the barouche. As he passed the gipsy camp, men and women threw themselves down on the sands, crying, "*Jai! Jungle da badshah jai!*" and the faces of the troopers darkened.

"That means," cried the Maharaj Kunwar, "Victory to the king of the desert." I have no money to give them. Have you, Tarvin Sahib?"

In his joy at being now safely on his way to Kate, Tarvin could have flung everything he possessed to the crowd—almost the Naulahka itself. He emptied a handful of copper and small silver among them, and the cry rose again, but bitter laughter was mingled with it, and the gipsy folk called to one another, mocking. The Maharaj Kunwar's face turned scarlet. He leaned forward, listening for an instant, and then shouted: "By Indur, it is for *him!* Scatter their tents!" At a wave of his hand the escort, wheeling, plunged through the camp in line, driving the light ash of the fires up in clouds, slashing the donkeys with the flat of their swords until they stampeded, and carrying away the frail brown tents on the butts of their reversed lances.

Tarvin looked on contentedly at the dispersal of the group, which he knew would have stopped him if he had been alone.

Umr Singh bit his lip. Then, turning to the Maharaj Kunwar, he smiled, and put forward from his belt the hilt of his sword in sign of fealty.

"It is just, my brother," he said in the vernacular. "But I"—here he raised his voice a little—"would not drive the gipsy folk too far. They always return."

"Aye," cried a voice from the huddled crowd, watching the wreck of the camp, significantly; "gipsies always return, my King."

"So does a dog," said the Maharaj, between his teeth. "Both are kicked. Drive on."

And a pillar of dust came to Estes's house, Tarvin riding in safety in the midst of it.

Telling the boys to play until he came out, he swept into the house, taking the steps two at a time, and discovered Kate in a dark corner of the parlor with a bit of sewing in her hand. As she looked up he saw that she was crying.

"Nick!" she exclaimed voicelessly. "*Nick!*" He had stopped, hesitating on the threshold; she dropped her work, and rose breathless. "You have come back! It is you! You are alive!"

Tarvin smiled, and held out his arms. "Come and see!" She took a step forward.

"Oh, I was afraid—"

"Come!"

She went doubtfully toward him. He caught her fast, and held her in his arms.

For a moment she let her head lie on his breast. Then she looked up. "This is n't what I meant," she protested.

"Oh, don't try to improve on it," Tarvin said hastily.

"She tried to poison me. I was sure when I heard nothing that she must have killed you. I fancied horrible things."

"Poor child! And your hospital has gone wrong! You have been having a hard time. But we will change all that. We must leave as soon as you can get ready. I've nipped her claws for a moment; I'm holding a hostage. But we can't keep that up forever. We must get away."

"We?" she repeated feebly.

"Well, do you want to go alone?"

She smiled as she released herself. "I want you to."

"And you?"

"I'm not worth thinking of. I have failed. Everything I meant to do has fallen about me in a heap. I feel burnt out, Nick—burnt out!"

"All right. We'll put in new works, and launch you on a fresh system. That's what I want. There shall be nothing to remind you that you ever saw Rhatore, dear."

"It was a mistake," she said.

"What?"

"Everything. My coming. My thinking I could do it. It's not a girl's work. It's my work, perhaps; but it's not for me. I have given it up, Nick. Take me home."

Tarvin gave an unbecoming shout of joy, and folded her in his arms again. He told her that they must be married at once, and start that night, if she could manage it; and Kate, dreading what might befall him, assented doubtfully. She spoke of preparations; but Tarvin said that they would prepare after they had done it. They could buy things at Bombay—stacks of things. He was sweeping her forward with the onrush of his extempore plans when she said suddenly: "But what of the dam, Nick? You can't leave that"

"Shucks!" exclaimed Tarvin, heartily. "You don't suppose there's any gold in the old river, do you?"

She recoiled quickly from his arms, staring at him in accusation and reproach.

"Do you mean that you have always known that there was no gold there?" she asked.

Tarvin pulled himself together quickly, but not so quickly that she did not catch the confession in his eye.

"I see you have," she said coldly.

Tarvin measured the crisis which had suddenly descended on him out of the clouds; he

achieved an instantaneous change of front, and met her, smiling.

"Certainly," he said; "I have been working it as a blind."

"A blind?" she repeated. "To cover what?"

"You."

"What do you mean?" she inquired, with a look in her eyes which made him uncomfortable.

"The Indian government allows no one to remain in the state without a definite purpose. I could n't tell Colonel Nolan that I had come courting you, could I?"

"I don't know. But you could have avoided taking the Maharajah's money to carry out this—this plan. An honest man would have avoided that."

"Oh, look here!" exclaimed Tarvin.

"How could you cheat the King into thinking that there was a reason for your work? how could you let him give you the labor of a thousand men? how could you take his money? O Nick!"

He gazed at her for a vacant and hopeless minute. "Why, Kate," he exclaimed, "do you know you are talking of the most stupendous joke the Indian empire has witnessed since the birth of time?"

This was pretty good, but it was not good enough. He plunged for a stronger hold as she answered, with a perilous little note of breakdown in her voice, "You make it worse."

"Well, your sense of humor never was your strongest point, you know, Kate." He took the seat next her, leaned over, and took her hand, as he went on. "Does n't it strike you as rather amusing, though, after all, to rip up half a state to be near a very small little girl—a very sweet, very extra lovely little girl, but still a rather tiny little girl in proportion to the size of the Amet Valley? Come, does n't it?"

"Is that all you have to say?" asked she.

Tarvin turned pale. He knew the tone of finality he heard in her voice; it went with a certain look of scorn when she spoke of any form of moral baseness that moved her. He recognized his condemnation in it and shuddered. In the moment that passed while he still kept silence he recognized this for the crisis of his life. Then he took strong hold of himself, and said quietly, easily, unscrupulously:

"Why, you don't suppose that I'm not going to ask the Maharajah for his bill, do you?"

She gasped a little. Her acquaintance with Tarvin did not help her to follow his dizzying changes of front. His bird's skill in making his level flight, his reeling dips and circling returns upon himself, all seemed part of a single impulse, ever remaining confusing to her. But she rightly believed in his central intention to still the square thing, if he could find out what it

was; and her belief in his general strength helped her not to see at this moment that he was deriving his sense of the square thing from her. She could not know, and probably could not have imagined, how little his own sense of the square thing had to do with any system of morality, and how entirely he must always define morality as what pleased Kate. Other women liked confections; she preferred morality, and he meant she should have it, if he had to turn pirate to get it for her.

"You did n't think I was n't paying for the show?" he pursued bravely; but in his heart he was saying, "She loathes it. She hates it. Why did n't I think? Why did n't I think?" He added aloud: "I had my fun, and now I've got you. You're both cheap at the price, and I'm going to step up and pay it like a little man. You must know that."

His smile met no answering smile. He mopped his forehead, and stared anxiously at her. All the easiness in the world could n't make him sure what she would say next. She said nothing, and he had to go on desperately, with a cold fear gathering about his heart. "Why, it's just like me, is n't it, Kate, to work a scheme on the old Rajah? It's like a man who owns a mine that's turning out \$2000 a month, to rig a game out in this desert country to do a confiding Indian prince out of a few thousand rupees?" He advanced this recently inspired conception of his conduct with an air of immemorial familiarity, born of desperation.

"What mine?" she asked with dry lips.

"The 'Lingering Lode,' of course. You've heard me speak of it?"

"Yes; but I did n't know —"

"That it was doing that? Well, it is — right along. Want to see the assay?"

"No," she answered. "No. But that makes you — Why, but, Nick, that makes you —"

"A rich man? Moderately, while the lead holds out. Too rich for petty larceny, I guess."

He was joking for his life. The heart-sickening seriousness of his unseriousness was making a hole in his head; the tension was too much for him. In the mad fear of that moment his perceptions doubled their fineness. Something went through him as he said "larceny." Then his heart stopped. A sure, awful, luminous perception leaped upon him, and he knew himself for lost.

If she hated this, what would she say to the other? Innocent, successful, triumphant, even gay, it seemed to him; but what to her? He turned sick.

Kate or the Naulahka. He must choose. The Naulahka or Kate?

"Don't make light of it," she was saying. "You would be just as honest if you could n't afford it, Nick. Ah," she went on, laying her

hand on his lightly, in mute petition for having even seemed to doubt him, "I know you, Nick. You like to make the better seem the worse reason; you like to pretend to be wicked. But who is so honest? O Nick! I knew you had to be true. If you were n't, everything else would be wrong."

He took her in his arms. "Would it, little girl?" he asked, looking down at her. "We must keep the other things right, then, at any expense."

He heaved a deep sigh as he stooped and kissed her.

"Have you such a thing as a box?" he asked, after a long pause.

"Any sort of box?" asked Kate, bewilderedly.

"No — well, it ought to be the finest box in the world, but I suppose one of those big grape-boxes will do. It is n't every day that one sends presents to a queen."

Kate handed him a large chip box in which long green grapes from Kabul had been packed. Discolored cotton-wool lay at the bottom.

"That was sold at the door the other day," she said. "Is it big enough?"

Tarvin turned away without answering, emptied something that clicked like a shower of pebbles upon the wool, and sighed deeply. Topaz was in that box. The voice of the Maharaj Kunwar lifted itself from the next room.

"Tarvin Sahib — Kate, we have eaten all the fruit, and now we want to do something else."

"One moment, little man," said Tarvin. With his back still toward Kate, he drew his hand caressingly, for the last time, over the blazing heap at the bottom of the box, fondling the stones one by one. The great green emerald pierced him, he thought, with a reproachful gaze. A mist crept into his eyes: the diamond was too bright. He shut the lid down upon the box hastily, and put it into Kate's hands with a decisive gesture; he made her hold it while he tied it in silence. Then, in a voice not his, he asked her to take the box to Sitabhai with his compliments. "No," he continued, seeing the alarm in her eyes; "she won't, she dare n't, hurt you now. Her child's coming along with us; and I'll go with you, of course, as far as I can. Glory be! it's the last journey that you'll ever undertake in this infernal land. The last but one, that's to say. We live at high pressure in Rhatore — too high pressure for me. Be quick, if you love me."

Kate hastened to put on her helmet, while Tarvin amused the two princes by allowing them to inspect his revolver, and promising at some more fitting season to shoot as many coins as they should demand. The lounging escort at the door was suddenly scattered by a trooper

from without, who flung his horse desperately through their ranks, shouting, "A letter for Tarvin Sahib!"

Tarvin stepped into the veranda, took a crumpled half-sheet of paper from the outstretched hand, and read these words, traced painfully and laboriously in an unformed round hand:

DEAR MR. TARVIN: Give me the boy, and keep the other thing. Your affectionate

FRIEND.

Tarvin chuckled, and thrust the note into his waistcoat pocket. "There is no answer," he said; and to himself: "You 're a thoughtful girl, Sitabhai; but I 'm afraid you 're just a little too thoughtful. That boy 's wanted for the next half-hour. Are you ready, Kate?"

The princes lamented loudly when they were told that Tarvin was riding over to the palace at once, and that, if they hoped for further entertainment, they must both go with him. "We will go into the great Durbar Hall," said the Maharaj Kunwar, consolingly, to his companion at last, "and make all the music-boxes play together."

"I want to see that man shoot," said Umr Singh. "I want to see him shoot something dead. I do not wish to go to the palace."

"You 'll ride on my horse," said Tarvin, when the answer had been interpreted, "and I 'll make him gallop all the way. Say, Prince, how fast do you think your carriage can go?"

"As fast as Miss Kate dares."

Kate stepped in, and the cavalcade galloped to the palace, Tarvin riding always a little in front, with Umr Singh clapping his hands on the saddle-bow.

"We must pull up at Sitabhai's wing, dear," Tarvin said. "You won't be afraid to walk in under the arch with me?"

"I trust you, Nick," she answered simply, getting out of the carriage.

"Then go into the woman's wing, give the box into Sitabhai's hands, and tell her that I sent it back. You 'll find she knows my name."

The horse trampled under the archway, Kate at its side, and Tarvin holding Umr Singh very much in evidence. The courtyard was empty, but as they came out into the sunshine by the central fountain the rustle and whisper behind the shutters rose, as the tiger-grass rustles when the wind blows through it.

"One minute, dear," said Tarvin, halting, "if you can bear this sun on your head."

A door opened, and a eunuch came out, beckoning silently to Kate. She followed him and disappeared, the door closing behind her. Tarvin's heart rose into his mouth, and un-

consciously he clasped Umr Singh so closely to his breast that the child cried out.

The whisper rose, and it seemed to Tarvin as if some one were sobbing behind the shutters. Then followed a peal of low, soft laughter, and the muscles at the corner of Tarvin's mouth relaxed. Umr Singh began to struggle in his arms.

"Not yet, young man. You must wait until — ah! thank God!"

Kate reappeared, her little figure framed against the darkness of the doorway. Behind her came the eunuch, crawling fearfully to Tarvin's side. Tarvin smiled affably, and dropped the amazed young Prince into his arms. Umr Singh was borne away kicking, and before they left the courtyard Tarvin heard the dry roar of an angry child, followed by an unmistakable yelp of pain. Tarvin smiled.

"They spank young princes in Rajputana. That 's one step on the path to progress. What did she say, Kate?"

"She said I was to be sure and tell you that she knew you were not afraid. 'Tell Tarvin Sahib that I knew he was not afraid.'"

"Where 's Umr Singh?" asked the Maharaj Kunwar from the barouche.

"He 's gone to his mother. I 'm afraid I can't amuse you just now, little man. I 've forty thousand things to do, and no time to do them in. Tell me where your father is."

"I do not know. There has been trouble and crying in the palace. The women are always crying, and that makes my father angry. I shall stay at Mr. Estes's, and play with Kate."

"Yes; let him stay," said Kate, quickly. "Nick, do you think I ought to leave him?"

"That 's another of the things I must fix," said Tarvin. "But first I must find the Maharajah, if I have to dig up Rhatore for him. What 's that, little one?"

A trooper whispered to the young Prince.

"This man says that he is there," said the Maharaj Kunwar. "He has been there since two days. I also have wished to see him."

"Very good. Drive home, Kate. I 'll wait here."

He reëntered the archway, and reined up. Again the whisper behind the shutter rose, and a man from a doorway demanded his business.

"I must see the Maharajah," said Tarvin.

"Wait," said the man. And Tarvin waited for five minutes, using his time for concentrated thought.

Then the Maharajah emerged, and amiability sat on every hair of his newly oiled mustaches.

For some mysterious reason Sitabhai had withdrawn the light of her countenance from him for two days, and had sat raging in her own apartments. Now the mood had passed,

and the gipsy would see him again. Therefore the Maharajah's heart was glad within him; and wisely, as befitted the husband of many wives, he did not inquire too closely into the reasons that had led to the change.

"Ah, Tarvin Sahib," said he, "I have not seen you for long. What is the news from the dam? Is there anything to see?"

"Maharajah Sahib, that 's what I 've come to talk about. There is nothing to see, and I think that there is no gold to be got at."

"That is bad," said the King, lightly.

"But there is a good deal to be seen, if you care to come along. I don't want to waste your money any more, now I 'm sure of the fact; but I don't see the use of saving all the powder on the dam. There must be five hundred pounds of it."

"I do not understand," said the Maharajah, whose mind was occupied with other things.

"Do you want to see the biggest explosion that you 've ever seen in your life? Do you want to hear the earth shake, and see the rocks fly?"

The Maharajah's face brightened.

"Will it be seen from the palace?" he said; "from the top of the palace?"

"Oh, yes; but the best place to watch it will be from the side of the river. I shall put the river back at five o'clock. It's three o'clock now. Will you be there, Maharajah Sahib?"

"I will be there. It will be a big *tamasha*. Five hundred pounds of powder! The earth will be rent in two."

"I should remark. And after that, Maharajah Sahib, I am going to be married; and then I am going away. Will you come to the wedding?"

The Maharajah shaded his eyes from the sun-glare, and peered up at Tarvin under his turban.

"By —, Tarvin Sahib," said he, "you are a quick man. So you will marry the doctored lady, and then you will go away? I will come to the wedding. I and Pertab Singh."

THE next two hours in the life of Nicholas Tarvin will never be adequately chronicled. There was a fierce need upon him to move mountains and to shift the poles of the earth; there was a strong horse beneath him, and in his heart the knowledge that he had lost the Naulahka and gained Kate. When he appeared, a meteor amid the coolies on the dam, they understood, and a word was spoken that great things were toward. The gang foreman turned to his shouts, and learned that the order of the day was destruction—the one thing that the Oriental fully comprehends.

They dismantled the powder-shed with outcries and fierce yells, hauled the bullock-carts

from the crown of the dam and dropped the derrick after them, and tore down the mat and grass coolie-lines. Then, Tarvin urging them always, they buried the powder-casks in the crown of the half-built dam, piled the wrapped charges upon them, and shoveled fresh sand atop of all.

It was a hasty onslaught, but the powder was at least all in one place; and it should be none of Tarvin's fault if the noise and smoke at least did not delight the Maharajah.

A little before five he came with his escort, and Tarvin, touching fire to a lengthened fuse, bade all men run back. The fire ate slowly into the crown of the dam. Then with a dull roar the dam opened out its heart in a sheet of white flame, and the masses of flying earth darkened the smoke above.

The ruin closed on itself for an instant before the waters of the Amet plunged forward into the gap, made a boiling rapid, and then spread themselves lazily along their accustomed levels.

The rain of things descending pitted the earth of the banks and threw the water in sheets and spurts. Then only the smoke and the blackened flanks of the dam, crumbling each minute as the river sucked them down, remained to tell of the work that had been.

"And now, Maharajah Sahib, what do I owe you?" said Tarvin, after he had satisfied himself that none of the more reckless coolies had been killed.

"That was very fine," said the Maharajah. "I never saw that before. It is a pity that it cannot come again."

"What do I owe you?" repeated Tarvin.

"For that? Oh, they were my people. They ate a little grain, and many were from my jails. The powder was from the arsenal. What is the use to talk of paying? Am I a *bunnia* that I can tell what there is to pay? It was a fine *tamasha*. By —, there is no dam left at all!"

"You might let me put it right."

"Tarvin Sahib, if you waited one year, or perhaps two years, you would get a bill; and besides, if anything was paid, the men who pay the convicts would take it all, and I should not be richer. They were my people, and the grain was cheap, and they have seen the *tamasha*. Enough. It is not good to talk of payment. Let us return to the city. By —, Tarvin Sahib, you are a quick man. Now there will be no one to play pachisi with me or to make me laugh. And the Maharaj Kunwar will be sorry also. But it is good that a man should marry. Yes; it is good. Why do you go, Tarvin Sahib? Is it an order of the Government?"

"Yes; the American government. I am wanted there to help govern my State."

"No telegram has come for you," said the King, simply. "But you are so quick."

Tarvin laughed lightly, wheeled his horse, and was gone, leaving the King interested but unmoved. He had finally learned to accept Tarvin and his ways as a natural phenomenon beyond control. As he drew rein instinctively opposite the missionary's door and looked for an instant at the city, the sense of the otherness of things seen daily that heralds swift coming change smote the mind of the American, and he shivered. "It was a bad dream, a very bad dream," he muttered; "and the worst of it is that not one of the boys in Topaz would ever believe half of it." Then the eyes that swept the arid landscape twinkled with many reminiscences. "Tarvin, my boy, you've played with a kingdom, and for results it lays over monkeying with the buzz-saw. You were left when you sized this state up for a played-out hole in the ground—badly left. If you have been romping around six months after something you had n't the sabe to hold when you 'd got, you've learned that much. Topaz! Poor old Topaz!" Again his eyes ran round the tawny horizon, and he laughed aloud. The little town under the shadow of Big Chief, ten thousand miles away and all ignorant of the mighty machinery that had moved in its behalf, would have resented that laugh; for Tarvin, fresh from events that had shaken Rhatore to its heart, was almost patronizing the child of his ambition.

He brought his hand down on his thigh with a smack, and turned his horse toward the telegraph-office. "How in the name of all that's good and holy," said he, "am I to clear up this business with the Mutrie? Even a copy of the Naulahka in glass would make her mouth water." The horse cantered on steadily, and Tarvin dismissed the matter with a generous sweep of his free hand. "If I can stand it she can. But I'll prepare her by electricity."

The dove-colored telegraph-operator and postmaster-general of the state remembers even to-day how the Englishman who was not an Englishman, and, therefore, doubly incomprehensible, climbed for the last time up the narrow stairs, sat down in the broken chair, and demanded absolute silence; how, at the end of fifteen minutes' portentous meditation and fingering of a thin mustache, he sighed heavily as is the custom of Englishmen when they have eaten that which disagrees with them, waved the operator aside, called up the next office, and clicked off a message with a haughty and high-stepping action of the hands; how he lingered long and lovingly over the last click, applied his ear to the instrument as though it could answer, and, turning with a large sweet smile, said: "Finis, Babu. Make a note of that," and swept forth chanting the war-cry of his State:

It is not wealth nor rank nor state,  
But git-up-and-git that makes men great.

THE bullock-cart creaked down the road to Rawut Junction in the first flush of a purple evening, and the low ranges of the Aravullis showed as many-colored cloud-banks against the turquoise sky-line. Behind it the red rock of Rhatore burned angrily on the yellow floors of the desert speckled with the shadows of the browsing camels. Overhead the crane and the wild duck were flocking back to their beds in the reeds, and gray monkeys, family by family, sat by the roadside, their arms round one another's necks. The evening star rose up from behind a jagged peak of rock and brushwood, so that its reflection might swim undisturbed at the bottom of an almost dried reservoir, buttressed with time-yellowed marble and flanked by silver plume-grass. Between the star and the earth wheeled huge fox-headed bats and night-jars hawking for the feather-winged moths. The buffaloes had left their water-holes, and the cattle were lying down for the night. Then villagers in far-away huts began to sing, and the hillsides were studded with home lights. The bullocks grunted as the driver twisted their tails, and the high grass by the roadside brushed with the wash of a wave of the open beach against the slow-turning tires.

The first breath of a cold-weather night made Kate wrap her rugs about her more closely. Tarvin was sitting at the back of the cart swinging his legs and staring at Rhatore before the bends of the road should hide it. The realization of defeat, remorse, and the torture of an over well-trained conscience were yet to come to Kate. In that hour, luxuriously disposed upon many cushions, she realized nothing more than a woman's complete contentment with the fact that there was a man in the world to do things for her, though she had not yet learned to lose her interest in how they were done. The reiterated and passionate farewells of the women in the palace, and the cyclonic sweep of a wedding at which Nick had refused to efface himself as a bridegroom should, but had flung all their world forward on the torrent of his own vitality, had worn her out. The yearning of homesickness—she had seen it in Mrs. Estes's wet eyes at the missionary's house an hour before—lay strong upon her, and she would fain have remembered her plunge into the world's evil as a dream of the night, but—

"Nick," she said softly.

"What is it, little woman?"

"Oh, nothing; I was thinking. Nick, what did you do about the Maharaj Kunwar?"

"He's fixed, or I'm mistaken. Don't worry

your head about that. After I'd explained a thing or two to old man Nolan he seemed to think well of inviting that young man to board with him until he starts for the Mayo College. Tumble?"

"His poor mother! If only I could have—"

"But you could n't, little woman. Hi! Look quick, Kate! There she goes! The last of Rhatore."

A string of colored lights high up on the hanging-gardens of the palace was being blotted out behind the velvet blackness of a hill-shoulder. Tarvin leaped to his feet, caught the

side of the cart, and bowed profoundly after the Oriental manner.

The lights disappeared one by one, even as the glories of a necklace had slid into a Kabul grape-box, till there remained only the flare from a window on a topmost bastion—a point of light as red and as remote as the blaze of the Black Diamond. That passed too, and the soft darkness rose out of the earth fold upon fold, wrapping the man and the woman.

"After all," said Tarvin, addressing the new-lighted firmament, "that was distinctly a side issue."

THE END.

## THE GREAT AMERICAN SAFETY-VALVE.

HE Republic is opportunity. It is the birth-right of every American boy to have the chance to be President, and of every American girl to have the chance to be the President's wife. The atmosphere is stimu-

lating to ambition. The desire inspired by the genius of American institutions is "to be equal to our superiors and superior to our equals." But in the midst of universal suggestions prompting the citizen to high ambitions, the ugly fact remains that the positions of political distinction are relatively very few compared to the vast multitude of possible aspirants. The practical politician confesses this in the wail, "There ain't offices enough to go round among the boys."

The intelligent foreigner is much perplexed by this problem. He can understand why the undistinguished classes on the Continent submit contentedly to obscure conditions of life. It is the lot to which they are born. But here every school-boy is taught that the highest stations are open to him; and in a thousand papers, books, lectures, speeches, and sermons he is told that perseverance alone will put the highest prizes within his grasp. What, then, can explain the contentedness of the millions who, as the French say, never "pierce" the level of mediocrity? What is the great American safety-valve for these ambitions for precedence which our national life generates, fosters, and stimulates, without adequate provision for their gratification?

A friend from abroad, without the philosophic insight of Mr. Bryce or the illuminating wit of Max O'Rell, was once presenting to me what seemed to him the serious phases of this problem. I thought myself competent to make

the explanation; but I did not know how to take hold of the subject. We were standing in the office of a large hotel at the time, when an incident gave me the clue.

There walked up to the register a sturdy American citizen, who seized the pen as if he were about to sign some momentous document. Bending over the open page of the book, he scrawled his name, his mouth moving and writhing with every twist of the pen. It occurred to me to look at the record of this new arrival, and this is what I saw: "Hon. Sock Bruitt, Chairman of the Committee on Pumps, Whiskyville, Texas."

Seizing this thread, I proceeded to unravel as best I could the tangled skein of American life as it is organized into social, business, religious, and other associations, all of them elaborately officered.

Until I made the effort to explain the matter to "an alien to the commonwealth," I had never realized the full significance of the non-political office-holding class in our country as a factor in the national life.

Take a city directory and examine the list of organizations usually printed in such a publication: you will see ample provision for the local ambitions of all the inhabitants. Take one of the books issued by a "live" church; examine the list of societies, devotional, missionary, temperance, young people's, Sunday-school, charitable, etc. The matter will be made clearer still if you study the subject in a small village where universal acquaintance is possible.

I made a test case of one small town, and found that every man, woman, and child (above ten years of age) in the place held an office—with the exception of a few scores of flabby, jellyfish characters, whose lack of ambition or enterprise removes them from consideration as elements of the problem.

But mere local precedence does not satisfy the more aspiring minds; hence, nearly all

of the thousand and one societies have State and national organizations. Here is an enormous supply of official positions. Every trade, every profession, every benevolence, every sport, every church furnishes distinctions commensurate in territorial magnitude with our great country.

And still the full measure of American officialism is not attained. There must be international organization. The earth must be girdled; and so, every society aims to plant a few lodges, or posts, or bands, or auxiliaries, or unions, or chapters (as they may be styled), beyond the seas. It little matters how few or scattered or insignificant these foreign plants may be. It is enough that "international organization has been accomplished"—and with it a new set of officials having world-wide jurisdiction.

The grandeur of all these distinctions suffers no diminution in their names. The chief officer is Ruler, Chancellor, Commander, Seigneur, President, Potentate, with many superlative and worshipful prefixes. And in the rituals of the numerous orders the Almighty is habitually referred to as the Supreme Commander, Ruler, Potentate, or otherwise, as the case may be. By this means the American imagination accomplishes an interuniversal as well as an international organization.

A few years ago, in a little country village,

there was instituted a chapter of a certain benevolent insurance order. The Chancellor was subsequently elected Grand Chancellor of the State. Afterward at a national convention he was made Supreme Grand Chancellor of the United States. The next year he was elected Most Supreme Grand Chancellor of the World; and it became his duty, the order paying his expenses, to make an international visitation to the three chapters in Australia, New Zealand, and England that composed the aforesaid "world."

When that triumphal tour was completed, his return home was heralded, and the chapter of his village arranged for a reception of the honorable dignitary. Never shall I forget the feeling of solemn awe that settled down upon the little community as the evening approached when the Most Supreme Grand Chancellor of the World was to arrive. This favored American was a "bigger man than old Grant."

Not only are there offices enough to "go round," but the really capable and pushing American is generally honored with a score. I have heard a busy and overworked man decline to be at the head of an organization because he was at the head of twenty-five already.

Here then we have the great American safety-valve—we are a nation of presidents.

*Walter B. Hill.*

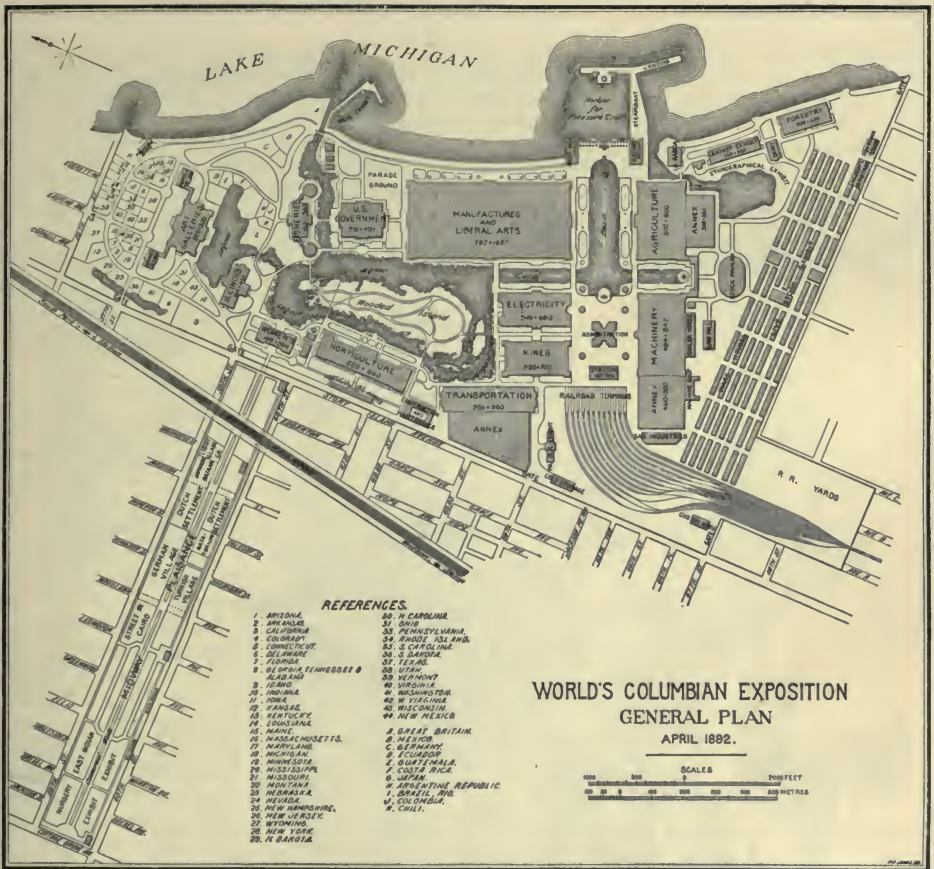

## TRAFFIC.

LIFE, the shrewd lapidary, is rich in wares  
Whose worth or charm a casual glance may see;  
And like perpetual purchasers are we,  
Won by the bounteous opulence he airs.  
Here shines a pearl of hope; here subtly glares  
An emerald of revenge; here thrilled we see  
A diamond of ambition; here may be  
Some ruby of sin that lures us and ensnares.

Continually above this bright array,  
As time flows on, we mortals flock to bend,  
Till body and limbs turn frail, till brows grow gray,  
Through trading, haggling, bartering without end—  
While for the inexorable price we pay,  
Months, years, even centuries, are the coins we spend.

*Edgar Fawcett.*

## ARCHITECTURE AT THE WORLD'S COLUMBIAN EXPOSITION.— II.

DRAWN BY ALBERT RANDOLPH ROSS.  
PHILIP MARTINY, SCULPTOR.

Group representing the four continents supporting Horoscope and crowning the corner pavilions of Agricultural Building.

IT has already been stated that the main object of these papers is to secure for the great buildings of the Exposition, through an analysis of the evolution of their several designs, an intelligent if not a respectful appreciation, because of the extreme importance of the occasion in the history of American art, and also because of the exceptional circumstances under which the buildings

to the most careless observers a certain indefinite impression of order, beauty, or grandeur, fails to convey to them the most essential part of the ideas which he has in mind to set forth. He needs this popular appreciation, not only as an encouragement, but as a corrective, and that he may bring himself into fuller and more perfect sympathy with the civilization which it is his duty to express.

Architecture and music alike have, in their highest developments, clearly defined qualities, which convey a delight of meaning to the capable eye or ear, but which, to the untrained mind, are nothing but inarticulate harmonies of form or sound.

In attempting, in the previous paper, to follow in outline the principles which controlled the designs of the Administration and Machinery buildings, it became evident that, before proceeding with the other buildings, it would be well to state, once for all, that in monumental

designs based upon pure classic formulas, the principle of symmetry—that is, of a balanced correspondence of parts on each side of a center line—must govern the disposition of the masses into which, in order to form an articulate composition, each façade should be divided. The greater the dignity and importance of the building, the more absolute and uncompromising must be the application of this principle. The

which ceremony and state become secondary to considerations of comfort and convenience.

With the exception of the Administration Building, which is a compact, domical composition, like the front of the Invalides, all the larger structures of the Exposition have a great extension of length in comparison to their average height, the former varying from 700 to 1700 feet, and the latter from 40 to 60. The application of the principle of symmetry to these has resulted uniformly in a central pavilion of some sort, and in a corner pavilion of varying importance on each angle of the façades. This remark does not apply to the Transportation and Fisheries buildings, which are not classic in form or intention. Between these pavilions there are intermediate spaces known as curtain-walls, the architectural character of which depends on a continuous repetition of bays, developed from the interior structure, and constituting the characteristic mass of the frontage, to which the three pavilions serve as points of emphasis and relief. But it will be found that this arrangement of the several buildings is not only the result

DETAIL OF FOUNTAIN BY FREDERICK MACMONNIES.

monument must be evident as the orderly result of forethought, and not as a growth from a succession of unexpected contingencies. It must embody the idea of a harmonious development of structure from beginning to end, so exactly adjusted, and so carefully proportioned in respect to its elements, that nothing can be added to or taken from it without sensibly affecting the composite organism as a whole. The test of the completeness of a classic design resides in its sensitiveness to change—a sensitiveness which becomes more delicate as the design approaches perfection. In fact, symmetry is the visible expression of unity. The moment the correspondence of balanced parts on each side of a center line is disturbed by the introduction on one side of a mass or detail which does not appear on the other, at that moment the design begins to lose somewhat of its unity and to enter the domain of the picturesque, in

of the common observance of an abstract principle of design, but follows from an obvious necessity of the plan in each case, from the mutual relations of neighboring structures, and from considerations of the most convenient ingress and egress.

It will be remembered that the architects of the five buildings surrounding the great court, which have the closest architectural relations, agreed, for the sake of securing a harmonious result, to confine themselves to pure classic forms in their designs, to fix upon 60 feet from the ground as the height of their main cornices, to provide for an open portico or shelter along their whole frontage, and to assume about 25 feet as their module or unit of dimension. We have seen also that one of the results of the fundamental conditions of the plan is the division of the façades respectively by a central pavilion and by corner pavilions, with stretches of cur-

tain-wall between. Moreover, each of these compositions has submitted to certain compromises for the sake of harmony with its neighbors. Now this stately uniformity of design would have been too serious for an occasion of festivity, if it were not relieved by a certain

son more subtle and sensitive than would be possible had they been at liberty to handle their common theme without definite and arbitrary restrictions of form. Whether the test is one of architecture or poetry (and the two are closely analogous), it seems to compel the

GREAT CENTRAL PORCH OF AGRICULTURAL BUILDING.

luxury of conventional ornament, sculpture, painting, and decoration in metals, and by a profusion of bright and joyful accessories. We shall now see how this uniformity of scheme, apparently working for a monotony which would be fatiguing, is, by the operation of the personal equation of the architect in each case, and by the adjustment of each building to its especial use, entirely consistent with that individuality of technic, of sentiment, and of expression which constitutes the essential difference between a cold academical composition and a work of art having a definite purpose.

By this apparent identity in general outline and language of form the architects have necessarily been invited to a study of detail and expression far more fastidious than would be easily practicable in dealing with a style less accurately formulated. In somewhat similar manner a dozen trained writers, expressing their thoughts on a similar range of subjects in an established literary form,—in that of the sonnet for example,—would commit themselves by their differences in treatment to a compari-

architect or poet to enter a region, if not of higher thought, then of more delicate study and of finer discrimination in method. Freedom of style, though it is the natural and healthy condition of architecture in our country, and adapts itself more readily to our inventiveness in structure and to the practical exigencies of building, is also a temptation to crude experiments, to *tours de force*, and to surprises of design, such as form the characteristic features of an American city. Under these circumstances, personal idiosyncrasies and accidents of mood or temperament are apt to have an undue influence upon current architecture, and to perpetuate, in monumental form, the caprice of a moment or a passing fashion of design, which, in a year's time, the author himself may be the first to repudiate. It is the aim of our architectural schools not to kill but to correct this abundant vitality, and to direct it into channels of fruitful and rational progress.

A glance at the general plan of the grounds will show that the buildings are separated one from the other by avenues of water or land

sufficiently wide to furnish noble vistas penetrating to the remoter regions of the Park, and to isolate each structure, so that its characteristic mass and details may not be confused by those of its neighbors, but not so wide as to prevent their mutual architectural relations from being clearly evident in a common alignment, and in a common observance of the sys-

department, which we have already discussed. The problem was how to cover this entire area with a building which should have due regard to its relations to the grounds and neighboring buildings; by its divisions should provide for the orderly arrangement and classification of its contents, and for the most convenient and economical structure; and should secure, not

PHILIP MARTINY SCULPTOR

CUPIDS FROM CERES GROUP (AGRICULTURAL BUILDING).

tem of axial lines which controls the location and arrangement of the group as a whole.

The general disposition of masses in these façades being thus defined, the way seems to be prepared for a more intelligent examination of the processes by which the especial architectural character of each building has been evolved.

It will be remembered that the great court of the Exposition is bounded on the south by the two palaces of Machinery and Agriculture, a minor court being provided between them. The latter building has a north frontage on the court and a south frontage toward the Live-Stock department, each 800 feet in length, while its west façade, of 500 feet, looks on the minor court, and its east on the lake. Its area, not including the annexes in the rear, thus covers nearly nine acres and a half, or a space about equal to the main building of the Machinery

only for the first floor, but for an extensive series of galleries, an effective and adequate lighting throughout. This problem must also embrace a due consideration for a division of the façades corresponding to the plan, so that its architectural character should, as far as possible, be developed from the conditions of structure.

The architects, Messrs. McKim, Mead & White of New York, solved this problem by converting their area into a hollow square surrounded continuously by buildings, and by crossing this hollow square in the center with two high naves of equal width, at right angles one to the other and open from floor to roof, each being accompanied on both sides by two-storied aisles, thus forming two clearstories on each roof-slope for lighting the interior space. The four long courts, 80 x 280, left by this arrangement, being needed for exhibition purposes, are severally occupied by three lower

longitudinal aisles, each covered with a double-pitched roof so devised that, by a system of skylights and clear-stories, abundant light should be provided for the area beneath. These three aisles are also in two stories, with an opening in the second story under the center aisle to admit light to the main floor beneath. Thus the entire space of nine acres and a half is covered and lighted, and the galleries furnish about five additional acres of floor space.

This adjustment of the plan is entirely in the interests of the agricultural exposition, with no unnecessary concessions to interior architectural effect. But this effect has nevertheless been obtained by the wide and lofty central naves, which invite the visitors to proceed on the axial lines of the building for a general survey of its contents, without distractions, and by the system of aisles on each hand, which enables them to pursue their investigations in detail with the least possible chance of confusion. The arrangement also facilitates the work of classification, and the whole presents

A mighty maze, but not without a plan.

The *corps du bâtiment* inclosing the area is 96 feet wide on the long sides and 48 feet wide on the shorter sides. Where these come together at the angles of the building they naturally constitute corner pavilions, 48 feet wide on the long fronts and 96 on the short fronts; and where the naves, 95 feet wide, with their attendant aisles, 23½ feet wide, encounter the center of each façade, a central pavilion of about 118 feet results, which, from its connection with the axial line or main avenue, becomes the main porch of that side.

The architects thus found imposed upon each of their four façades the conventional arrangement of a central pavilion and corner pavilions of certain specified dimensions, with curtain-walls between. Under the agreement of the architects of the court structures, a continuous covered ambulatory or portico was required inside the building line, and there was prescribed a height of 60 feet for the main cornice. They considered that the dignity of their theme would be best expressed by the use of a colossal Corinthian order, very richly embellished, as the principal vehicle of architectural expression in their design.

Kenyon Cox - 1892 - from a photograph from original sketches by P. Marling.

ONE OF TWELVE FIGURES HOLDING SIGNS OF THE ZODIAC (AGRICULTURAL BUILDING).

Accordingly they determined to occupy the whole required height with columns or pilasters 50 feet high, without pedestals, and supporting an entablature 10 feet high, the whole resting directly upon the terrace, 40 feet wide, on which their building stands. But the north front, as viewed from the opposite side of the basin, is provided with an effective and majestic stylobate in the face-walls of the two terraces which run parallel with it, the lower one being washed by the waters of the great basin, and the upper being crowned by a balustrade with vases and statues, a rostral column standing at each end. To emphasize this relation of the terraces to the façade, a broad staircase, corresponding in width to the projecting columnar portico of the central pavilion, descends to the water's edge, after the manner of the landings in front of the palaces of Venice. Now it was evident that to extend a colossal order along the whole front, without interruption, would be monotonous and mechanical. It would force a formula—noble and majestic, indeed, but still a formula—into predominance over the more important subject matter of the composition. Therefore they concluded to group their great pilasters at points where the main divisions of the plan would be best illustrated. The central pavilion admitted eight pilasters, and each of the corner pavilions four, on the main front. But this concentration of the order at three points on the long façades, the middle and the ends, gave such long intervals between that the composition became disjointed and straggling. It was clear that the necessary unity could be obtained only by some sort of repetition of the order in these intermediate curtain-walls. The plan was devised with forethought for this emergency, for it provided for a series of subordinate transverse passages, or aisles, across the building, ending in secondary doorways, or vomitories, on the façades, occurring three times in each curtain-wall at equal intervals. These doorways furnish a motive for repetition of the order in two pilasters for each, thus forming smaller pavilions, or, more properly, piers; so that the pilasters occur discontinuously along the frontage in a manner to satisfy at once the practical and the esthetic considerations involved in the problem. This repetition is like the recurrence of a leading motive or theme in a fugue, which is set forth in full at one point and repeated at others by hints of various emphasis. In the architectural composition the main statement, with eight pilasters, occurs very properly in the center; the secondary statement, with four pilasters, at the ends; and the third, of minor importance, with two pilasters, at three intermediate points. Thus, also, the various points of ingress and egress along the façades are illustrated with a varying emphasis proportioned to their varying importance.

But the equal spaces of curtain-wall between these great pilastered pavilions and piers still constitute, in the aggregate, the larger part of the frontage. The spacing of structural interior supports generates a corresponding division of each of these wall-spaces into three equal bays; the necessity of obtaining for the interior as much light as possible suggests the piercing of each bay with a great arch, framed with bronzed grilles for windows; the two-storied division of the interior imposes a horizontal division of these arches by a subordinate entablature on a line with the gallery floors; and to provide, as agreed, for an outside ambulatory within the building lines, the space underneath must be left open, and this entablature is supported in each bay by an open screen of two subordinate columns, behind which the portico required traverses the whole length of each front. In fact, this inferior order of columns constitutes a closely set open colonnade, practically continuous between the greater order of pilasters and columns in the pavilions, giving to the vertical elements of the composition a delicate and refined contrast of harmony and scale hardly possible in a style less highly organized. But these vertical elements are always carefully subordinated to the horizontal lines of the entablatures. In this way the plans and elevations developed together with mutual concessions, and, at the same time, the whole arrangement, with its detail of buttress-like engaged columns, continuous with those of the ambulatory and supporting statues between the arches, follows the conventions of imperial Roman architecture.

Now each pier or buttress and pavilion must have its special treatment in respect to the skyline. From an academical point of view, a fitting culmination for the center of an architectural composition so heroic in size and so full of detail is some form of dome. From a poetical standpoint, an appropriate main vestibule to a structure devoted to an exhibition of agriculture is a temple to Ceres. The conditions of the plan made it possible to realize this idea in a circular domical chamber, 78 feet in diameter and 129 feet high within, treated with the order of the exterior in eight pairs of columns, which surround and enshrine the central statue of the goddess. Her benign and beautiful presence may serve in a brief interval of unconscious influence to bring the distracted minds of the visitors, as they hurry past, into some degree of sympathy with the agricultural collections within. To this vestibule, the design of which is completed and enriched by paintings, is applied a projecting exterior portico of four detached columns, flanked by solid wings, which are treated with pilasters; the whole being surmounted by an attic order, decorated with

PHILIP MARTINY, SCULPTOR.

ENGRAVED BY FRANK FRENCH.

FIGURE OF ABUNDANCE (AGRICULTURAL BUILDING).

winged figures, somewhat like those known as the "Incantada" at Salonica, and a central pediment, peopled with symbolic sculpture, so disposed and grouped as to lead the eye upward to a circular podium or drum, supporting a low, spreading dome, the total effect being somewhat similar to that of the Roman Pantheon. Each buttress along the fronts is crowned with a colossal group, figurative of pastoral or agricultural life, and each of the corner pavilions is roofed with an attic or podium corresponding to that in the central pavilion, supporting a low-stepped pyramid, accompanied at its base by sculptured groups and eagles, and crowned above by a composition of figures holding aloft a globe.

The return walls on the east, toward the Lake, and on the west, toward the minor court between the Agriculture and Machinery buildings, grow without apparent effort from the conditions of the plan, as described. The corner pavilions are here made more important than those of the main front, and the central pavilion is much subordinated, while the intermediate curtain-walls are composed like those of the front, but with only one repetition of the triple-arched bay on each side of the center. The west front responds to its neighbor on the opposite side of the canal with harmonious contrast, and with a certain high-bred courtesy, in which each seems to aid and to receive aid from the other.

In its various combinations, the exterior sculpture, which is the work of Mr. Philip Martiny of New York, is intended to symbolize bucolic labor: the central groups typifying human efforts in agriculture; those next the center showing the horse held in restraint by grooms; and those nearer the outward wings exhibiting the ox, urged forward, dragging the elementary beam-plow of Virgil.

The whole architectural mass may be traced rather to the Palatine Mount than to the influence of Palladio or Vignola, and it presents not only in scale and extent, but in its serious beauty, in its splendor of enrichment and refinement of detail, a model of imperial luxury and pomp, borrowed to adorn the peaceful triumph of the latest of civilizations.

THAT department of the Exposition classified as "Manufactures and the Liberal Arts" embraces so many and such varied industrial interests, that the building to accommodate it must be by far the most spacious in Jackson Park. The thirty acres which were assigned to it, though including an area much larger than that assigned to a single department in any previous Exposition, will need to be carefully husbanded to meet the requirements for space under this head. The site admitted of a building,

in exterior dimensions, 1687 feet long, north and south, and 787 feet in width. Its southern end, forming a part of the inclosure of the great court, was necessarily subjected to the same conditions regarding architectural style and scale as were agreed upon for the other structures around the quadrangle, and these conditions were extended so as to control the other façades. The interposition of an architectural wall nearly 1700 feet long, and but little over 60 feet high, between the lake and the flat district known as the lagoon would have the effect of transforming the whole aspect of the Park as viewed from any point on land or water. The importance of an adequate treatment of this vast scheme was obvious.

Mr. George B. Post of New York, the architect of the building, in considering its general plan, promptly fell upon the scheme of converting its area into a court by surrounding it with a continuous building, and of cutting this court in twain with a central circular structure; thus recalling, but on an immensely larger scale, a much admired disposition of Philibert Delorme in his first project for the palace of the Tuileries as a residence for Catherine de Médicis. But even with such subdivisions the scheme was still so heroic in dimension that no such correspondence as this could be of the slightest avail in furnishing him with types of architectural treatment. He found that he must work in regions quite removed from historical experience. With his assumed module of 25 feet, he found that he could carry around the four sides of his area of thirty acres a building composed of a nave 107 feet 9 inches wide and 114 feet high, covered with a pitched roof with clearstories, and supported on each side by two-storied aisles, or lean-tos, 45 feet wide. This arrangement of plan permitted ready illumination, easy classification, and convenient communication. It left an interior quadrangle 1237 feet long and 337 feet wide. The domical hall in the center of this space was planned to be 260 feet in clear diameter and 160 feet high, surrounded, like the other parts of the building, with two-storied aisles, or lean-tos, 45 feet wide. These circular aisles, compared with the seating space of the Roman Colosseum, would have inclosed an area largely in excess of that great arena. The two courts thus obtained Mr. Post proposed to treat as gardens with fountains and kiosks, or, if more space should be needed for exhibition purposes, to occupy them with a series of covered sheds.

But as the practical needs of this important and comprehensive part of the Exposition became more evident, it was finally concluded to abandon the central dome, and to convert the whole interior court into the largest unencumbered hall ever constructed, by covering it with

a glazed semicircular roof without columns, supported by arched steel trusses of 387 feet clear span, 50 feet apart, and with a radius of 190 feet, giving an extreme height of 210 feet. This roof was arranged to be hipped at the ends. The much admired truss of Machinery Hall in the last Paris Exposition (the largest constructed for roofing purposes up to that time) is inferior to this in span and is 58 feet lower. It has been proposed to equip this vast hall, containing nearly 500,000 square feet of clear floor-space inside the enveloping building, with seats and a stage for the ceremonies of the inauguration, before adjusting it to its legitimate objects. It was sufficiently evident that the mountainous roof which covered the hall could not fail, from the mere power and weight of its enormous structural mass, to impose upon the scheme of the building, as a work of art, an element unknown in the precedents of monumental architecture.

In studying the most effective architectural treatment of a symmetrical building more than a third of a mile long and almost a sixth of a mile wide, with a height of cornice limited to 60 feet, the architect was confronted by conditions of composition such as perhaps had not occurred before. The natural dispositions of any extended building, which is to be adapted, not to various and different services, like a royal château, with its halls of ceremony, its wings for household convenience, its chapels and galleries, its provisions for dignity and its provisions for comfort, but to a single and well-understood purpose, must be guided by the most convenient and economical structure, and show a distinct unity of thought throughout. This unity is expressed by a mutual dependence of parts. We must at least have some feature of emphasis on the corners, against which the long fronts may stop—a period, as it were, and place of rest; and there is even

greater necessity for pavilions of sufficient importance to give dignity to the entrances. The natural place for these is in the middle of each front, where the visitors may be introduced most conveniently to the great interior space, and receive their first impressions of its grandeur. We have seen how the architects of the Agricultural Building on the opposite side of the court,—where it was understood that everything must be in full dress and on parade, so to speak,—in adopting this natural treatment in their façade, found it necessary, for the sake of variety and movement, to provide between the center and the ends certain regularly disposed, intermediate accentuations, which the eye, in surveying the whole façade, could readily grasp and justify by an instinctive balancing of the masses on each side of the center line. The mind of the observer is flattered by this evidence of art.

Architecture, as compared with nature, has been called a creation of the second order; but this secondary creation must be fundamentally controlled by conditions of structure which, to a greater or less degree, must impose regularity or repetition of parts, as contrasted with the irregularity or picturesqueness which results from the infinite resources and the accidental conditions in nature. Medieval art, though often picturesque in its effects, is subject to these human conditions no less than classic art.

On the one hand the author of these almost interminable façades felt that he could not treat them picturesquely or accidentally without sacrifice of truth and dignity, and, on the other hand, that to break them with frequent pavilions, however subordinate to a preëminent central feature, would fail to procure for them all the advantages of symmetry; because, in a length so great, the mind could not readily discover and, at a glance, compare that correspondence of parts on each side of the center which is essential to effects of this sort. The rule of composition which properly governs a building 500 to 800 feet long and 60 feet high cannot be applied successfully to one two or three times as long and no higher. The architect, therefore, remembering the imposing effects of certain long porticos and aqueducts of Roman structure, had the courage, in this case, to withstand the temptations furnished by the customs of the Renaissance architects in their palaces and other public monuments, and to leave his sky-line and his frontage unbroken by any competition of pavilions save the one in the center and that on each angle of each front. By this severe measure he hoped to make the unity of his design clear to the most casual observer.

The module or unit of measurement, of 25 feet, with which the architect found it convenient to lay out his plan, communicated to his

elevations a corresponding division of bays, of which 29 occur on each half of the long fronts and 11 on each half of the short fronts. These bays are treated with arches, springing from piers, and each archway embraces two stories. It was anticipated that these long, monotonous, and mechanical perspectives of equal and similar arches would affect the eye like the arcades of the Campagna, and would rather increase than diminish the apparent length of the building; for repetition, even if mechanical, is, humanly speaking, a suggestion of the infinite, and the architect who has the opportunity and self-denial to adopt it frankly, and on a scale so vast, would give even to the most thoughtless and most uncritical minds a memorable impression of architectural majesty and repose.

Now the covered ambulatory, or stoa, which is made a feature of all the court fronts, should, on account of the great length of these long façades, where there is no other natural refuge from the sun, be extended all around the building, but within its lines. The lintel course or decorated belt, which is the exterior development of the floor of the second story in each bay, is supported by an open, flat, segmental arch springing from pier to pier; behind these arches this continuous ambulatory obtains spacious shade. Frequent doors open upon it from the interior. No subordinate architectural order of columns was placed under this lintel course, as was done with singularly happy results in the Agricultural Building, because it was apparent that such an order would not have been in scale with the rest of the design, and would have introduced an element which would have complicated with unnecessary details the careful simplicity of its lines and the studied breadth of its general treatment.

The adoption of a severe classical formula for the building naturally led to the adoption of a common *motif* for the four central pavilions, and another, adapted to its situation, for each of the corner pavilions. These repetitions were encouraged by the fact that all the façades were of equal importance. As these pavilions must be distinctly recognized as the main porches, they must break the monotony with emphasis, or they will not be adequate. Consequently at these points there should be a sudden change in the architectural scheme of the fronts. But the strictly classic ideal does not seem to be favorable to the absolute interruption of all the horizontal lines of frontage by the pavilions; there must be some connection by continuity of lines between them.<sup>1</sup> The Greek

<sup>1</sup> The solution of this continuity, boldly attempted by the architects of the Machinery Building in their central towers, which, as we have noted, interrupt all the lines, constitutes the most remarkable feature of their design. This, as we have said, is contrary to the

KARL BITTER, SCULPTOR.

PART OF GROUP ABOVE MAIN ENTRANCE OF MANUFACTURES AND LIBERAL ARTS BUILDING.

idea of a monumental entrance is a columned propylæum; that of the Romans, who better understood pomp and ceremony, is an arch. The former would be appropriate if the general architectural character of the façades were based upon an order of columns or pilasters; in the present case the latter would more naturally follow.

Thus the architect, by logical process, encountered the idea of inserting in the midst of his arcades the triple triumphal arches of Constantine or Septimius Severus, and of stopping his arcade at the corners with the single arch of Titus or Trajan, the *motif* in both cases being very greatly enlarged from the original in order to fit the greater scale of the building. The architectural connection of the central pavilions with the mass of the structure is established by bringing their two side arches into the same scale as those of the curtain-walls, and by causing the main cornice line to be continued across the central pavilion or pylon as a string-

strict classic idea, but in so far as this interruption does not destroy the unity of the composition, it is the suc-

cessful stroke of one who dares to put his fate to the touch, "to gain or lose it all." course over its two side arches, and as an impost, from which springs its great central arch. Over the whole is carried a horizontal entablature with a high attic, and in front of the four piers are lofty pedestaled columns, after the manner of buttresses, supporting figures against the attic, thus closely following the characteristics of the Roman prototypes. The order employed for these columns is the sumptuous Corinthian of the temple of Jupiter Stator, the columns being 65 feet high with a lower diameter of more than 6 feet. We have already intimated that the architect turned the four corners of this building with a single arch on each adjacent face of the angles; these also are decorated with magnificent coupled Corinthian columns, as in some of the Roman examples. The width of the corner pavilions is adjusted to the width of the ambulatory which enters them on each side. The esthetic function of these boldly accentuated buttress-columns, which are clearly

cessful stroke of one who dares to put his fate to the touch, "to gain or lose it all."

detached from the mass of the building, is sufficiently evident in the perspective views of the long fronts. They furnish the only strongly marked vertical lines in the composition, and by contrast suffice to relieve the design from the excessive predominance of its horizontal lines.

It is to be noted that as yet the architectural expression of this building, the development of which we have been following in the natural order of design, has been confined to the exterior closure of a vast interior space. Before it had been happily determined to cover the interior court with a great glazed roof, it was the professional instinct of Mr. Post to indicate externally that the area enveloped by his façades was not empty, but had a magnificent interior central feature in his original circular hall. To this end, and in order that this feature might become evident from afar as an essential element of design, it became necessary to cover it with a dome sufficiently lofty to be seen over the sky-lines of the inclosing galleries from usual points of view, and to form a crown and finish to the long, low mass of his building. This feature, if executed, would have exceeded any similar structure yet erected; but as it challenged comparison with the dome of the porch of the Exposition, the preëminence of which it was considered desirable to maintain, it was reluctantly abandoned. But the final treatment of the central court as a hall, 1287 x 387 feet in floor area, covered with a semicircular roof, whose longitudinal ridge rises far above the cornice of the façades, at once suggested an entirely different architectural aspect for the building. By the upward succession of cornice-line, 60 feet high, and clearstory-line, 108 feet high, culminating in a central ridge-line, 210 feet high, a pyramidal effect was secured; the low-lying mass at once obtained adequate height; its vast extent was condoned and explained; a dominant expression of unity was conferred upon the composition; the upper outlines of the façades were projected against a colossal roof instead of the empty sky; and the roof itself, wisely left to the majesty of its dimensions and to the simplicity of its structure for architectural effect, enhanced the refinement and purity of the architectural screens below.

Indeed, this design as a whole admirably illustrates the fact that reservation rather than expenditure of force is the secret of noble art. The modern architectural mind is an archaeological chaos of ideas inherited from Egypt, from the far East, from Greece and Rome, from the middle ages, and from the Renaissance. Under these circumstances the highest virtue which can be exercised by the educated architect of

to-day is self-denial in the use of his treasures. He who squanders them in his work betrays his trust, and depraves the art of his time. He who can be refined in the use of the splendid resources furnished by his knowledge of the past, who can be simple in the midst of the temptations to display his wealth, is rendering high service to a civilization which, in the midst of its complications and sophistications, needs the refreshment and chastisement of pure types.

It is evident that within his classic Roman frame Mr. Post has desired, in his detail of decoration, to bring his design into sympathy with modern civilizations; for we shall see that the luxury of Napoleon III. affects the sculpture of his spandrels and panels, and that nearly all the ornament bears traces of the influence of the latest French Renaissance and the last Paris Exposition. Moreover, in order to relieve his design from the serious expression imposed upon it by the grandeur of his leading motives, he makes a very proper concession to the festive and holiday aspect which should pervade the place by planting permanent standards and gonfalons on his triumphal arches, and by decorating his battlements with banner-staffs and bunting.

We have repeatedly stated that these papers do not embody either a description or a criticism, nor yet an apology, but constitute an attempt to explain the architectural development of the Exposition buildings. But it may be proper, before leaving the consideration of the largest of these buildings, to look back upon Mr. Post's immense façades, and to ask whether, if they had been treated with the variety, contrast, and balance of motives customary in the works of the Renaissance, if they had been broken by towers and campaniles, or tormented by gabled pavilions, they would not have presented a somewhat confused and incoherent aspect, wanting in apparent unity of thought, and resembling rather a combination of many buildings of various use than a single building of one use; and further, whether the simplicity of treatment which he has preferred (and which some, not considering its detail and the unusual difficulties of the problem, might call poverty) has not resulted in a composition having architectural qualities which, instead of confusing and puzzling the mind, can be read, understood, and remembered with pleasure. The civilization of our time owes a debt of gratitude to any architect, or to any writer, who, in the midst of the temptations which beset us to force effects of beauty by affectations and mannerisms, dares to make his work at once strong, simple, and elegant.

## VII.

AD Alan only spoken on one of those two or three happy days before the London letter came! But a tendency to mischance of one sort or another was characteristic of the boy's headlong, sanguine temperament. The good moment passed, and a change in the household atmosphere created a new barrier between him and his father.

Dolly had ridden home at the top of Modoc's speed, to make up for all foolish delays; for Dunsmuir knew to a moment how long it took a rider to meet the stage, and was ever on the watch for its distant wheels and the messenger's return. She gave him the packet, and went to her room to make herself neat for lessons. In the dining-room Alan joined her, loitering behind, his eyes still upon his half-learned task. They knew that something was amiss from the answer that their father gave to Dolly's knock:

"Excused for to-day. I have some business to attend to."

His step was not heard on the porch at his usual hour for exercise. Dolly, watering her roses outside the study window when the house shadow fell that way, heard him tramping about the room, and pronouncing words to himself in a deep, perturbed voice. At dinner the young people stood waiting for him to take the head of the table.

"Margaret, will you ask him if he's coming? He never minds you," Dolly pleaded.

Margaret sighed, and smoothed her hair back from her flushed face, and laid aside her kitchen apron before knocking at the study door.

"Will the denner wait, sir, till you're by wi' your writing?" she asked when he had shortly bidden her, "Come!"

"What! is it dinner? Let the children sit down without me. Margaret, which of the men go to town to-morrow?" It was the day before the Fourth.

"Why, sir, I think they'll all be going but Job."

<sup>1</sup> Copyright, 1892, by Mary Hallock Foote.

"Tell Job that Long John may stop at the cabin, and Job is to come for me with the buckboard at nine to-morrow morning. We shall be back early. John may have his evening in town."

"Will that be all, sir?"

"That is all, thank you, Margaret."

"Wad ye eat a bittie if I fetch it entil ye—just a morsel, to tak' the bluid from the head? Will ye no?" she pressed him, with motherly anxiety.

"Shut the door, and don't stand there bletherin'!" Dunsmuir shouted.

Nevertheless, an hour later the hand of Margaret noiselessly obtruded a tray into the room; on it was a dish of iced tomatoes with a mayonnaise, a plate of thin bread and butter, a slice or two of cold boiled ham, and a bottle of beer. When the tray was brought away, Margaret, who had stayed to do some ironing in the cool of the evening, saw with triumph that her offering had not been rejected.

"When he 's that way," she said to Dolly, "he 's just like a fashious wean; he disna want a thing named to him."

She repeated to no one her master's orders for the morning; all that he wished said he would prefer to say himself. And so it happened that Alan went off at sunrise on his own scheme of pleasure for the day,—having helped himself to a cold breakfast in the pantry,—not knowing that his father was bound for the town, like himself. Alan had one or two acquaintances who were to take part in the procession of the "Horniquebriniques." He had been urged to choose a character and to join, but, in his usual way, it was at the last moment, and without premeditation, that he decided to do so. His arm was but just well. Except for the stolen joy, now and then, of a wild moonlight gallop, life, according to his ideas, had been a steady grind. He had never acknowledged his father's right to condition him as to the use of his own horse. As a matter of principle, then, he was holding out, and cultivating meanwhile a sentiment of injury to strengthen his resolution.

It was in this mood that he stopped at Dutton's ranch and, assuming the owner's consent, borrowed an old mule of Job's called Susan. He also helped himself to one or two articles found in the cabin, with which to piece out his costume for the part he had chosen in the Horniquebriniques. As in the far West this humorous dramatization is not a common feature of the day we celebrate, a few words of description may help to explain its intense attractiveness to lads of Alan's age. It is a procession of mummers, masked or otherwise, on horseback, afoot, or in floats, who burlesque in dumb-show the prominent characters and institutions of the town, setting forth in a rough extravaganza

their weaknesses in the popular eye. The costumes are ridiculous, the wit is often coarse, the personal hits more than a little cruel. Yet the drolling seldom fails, in one way or another, to make its point, and the whole exhibition is not without a rude, poignant signification from the moral point of view.

Dunsmuir and Job were making way slowly through the crowd. They were endeavoring to gain the corner near the office of Marshall & Read, Dunsmuir's lawyers; but they were too late. The Horniquebriniques had started, the crowd backing down before them; there was nothing for it now but to haul up by the sidewalk until the fun had rolled by. Mock musicians, calling themselves the City Band, marched ahead of the procession, performing with cow-bells, tinware, and Chinese instruments of sound. The humor was here so overpowering as fairly to drown its own applause.

Dunsmuir, who was chewing the cud of his last and bitterest disappointment, was somewhat grimly disposed toward the day's festivities. He took little notice of the mob, as it screeched and rattled and caracoled by; but as the nuisance seemed to abate, Job spoke to him, calling his attention to a passing group which the crowd was then cheering. He looked up and smiled. He saw a broad, stout, florid man, costumed as a river-nymph, in pseudo-classic draperies, looped and girdled in such a manner as to display without offense as much as possible of his muscular proportions. He bore upon his shoulder a Chinese whisky-jar, one of a wholesale size. The vase was labeled "Norrisson's Ditch." The nymph's girdle, which must have measured full fifty inches, was stuck full of "water-contracts." Bunches of the enormous native-grown vegetables, mingled with sage-brush torn up by the roots, decorated the processional car, which was drawn by four fat, patient oxen placarded "Eastern Capital." The supporting figures of this symbolical group were an impecunious ranchman hunting in his ragged pockets for the wherewithal to pay his water-rates, and an abject Chinese vegetable-gardener, upon whose head from time to time the goddess of fertility tilted a small quantity of the sacred water of the ditch.

Broad as was the joke, Dunsmuir found no fault with it. But now a burst of applause greeted a new actor, who silently paced down the street at a respectful distance from the car of Irrigation. The little boys lining the gutters and packed into the backs of farmers' wagons screeched their comments, by way of explanation, to one another: "Hurrah for the Last Ditch!" shouted one precocious urchin.

"Says I to Sandy, 'Won't you lend me a mule?'"  
"Of course I will," says Sandy,"

sang another. Dunsmuir had taken these remarks as personal to himself until he turned and saw the quixotic figure intended to portray in its popular aspect the spirit of his well-known enterprise. Both he and Dutton had recognized Susan by her ear-mark, though she had been touched up anatomically with considerable skill and white paint to the likeness of a skeleton. She carried a slender, masked rider, dressed in pasteboard armor, relic of some amateur theatricals in the town. His crest was a sprig of sage united with the flowers of the wild thistle, and for a spear he carried, with some difficulty, it might be seen, an engineer's measuring-rod, to which a banneret was attached displaying the legend:

Don't tread on my Location!

This was plain enough for all to understand. The little boys pointed out to one another his big tin sword labeled "For Jumpers," and discussed the meaning of the device displayed upon his shield—a spread eagle perched on the rock-gate of the cañon, with the united crosses of St. George and St. Andrew flaming in the sky above it. This cognizance was a hasty inspiration of Alan's tossed off in the fury of conception, in red and white and black chalks. Any compunctions which the son of Dunsmuir might have had at the last moment must have given way before the artist's hunger for appreciation. To do Alan justice, he had not meant the impersonation for mockery, but merely as a good-natured acknowledgment of the well-known facts concerning his father's ditch. Above all, he had not bargained for his father as a spectator. He trusted now to spare him the pain of a recognition; but this was not to be.

Susan had one white and wicked eye, which she turned back upon the crowd, now pressing noisily upon her sedate progress. Hitherto, whatever culminating sense of indignity she may have been nursing she had kept to herself; but now, without apparent premeditation, she bucked her rider into the middle of the street bolted past the ox-team which blocked the way ahead, and was seen no more in town that day. The knight's mask and helmet had tumbled awry with the jar of his fall; Alan was obliged to free his head before he could see about him. A dozen hands assisted him to rise, and all the town beheld his angry blushes and knew him for his father's son. Confused and bitterly mortified, he took the first chance of escape which occurred to him; he ran and jumped aboard the Norrisson Ditch car, and the Knight of the Location made his exit in the tail-end of it, among the vegetables, waving his guidon and smiling in the hope of seeming not to care

for the shouts of laughter which followed him. The crowd had "caught on" with a wild burst of cheers to this last, most unintentional point which Alan had supplied, with his father as witness.

#### VIII.

It had been Alan's plan to remain for the fireworks on the evening of the Fourth, but his father's bitter face came between him and all further thoughts of a "good time." By sunset he was at home. He went straight to his father's room, and the two were shut in there together. Dolly awaited anxiously the close of the interview; but when the study door opened at last, she kept away, allowing Alan to escape without a question, even from her eyes. At the usual hour she went to bid her father good night. He detained her by the hand, leaning back in his chair and turning his face from the lamp. It was a close night, the sky overcast, the atmosphere heavy with an abortive effort to rain. The wind—what little there was—came up from the plains, a false, baffling wind, reversing the currents of coolness. It smelled of dust and wild sage, and in the pauses between the hot, prickly gusts mosquitos and moths swarmed outside the windows. All the screens were in; the lamp, lighted since dusk, increased the heat, and devoured the air of the room.

"Dolly, perhaps you will be wanting to speak to your brother to-night," said Dunsmuir, wearily. The lamp threw deep shadows over his lowered eyelids as he lay back in his great leather chair. It was some time since Dolly had seen him in that strong, direct light, of an evening; she thought him much worn, and thinner, even, since the spring.

"Has he gone out of the house?" he continued. "Say good night to him. We may not see so much of him for a time." He cleared his voice, which broke from nervousness or fatigue, and sat up, looking straight before him. "I shall not tell you his last ill-omened exploit. Perhaps he will tell you himself; it would cost him little, for I doubt if he sees what it signifies. I do not know how to reach him, nor indeed if there be any depth in him to reach. I have thought to try him now in earnest. Since he will not work, either for his love or his fear; since, it seems, he neither understands nor respects what we are here to do, nor enters into it, except in a low, clownish spirit—let him work now for his bread. To-morrow he goes below. He will live at the cabin, get his meals with the men, and take orders from Job. I will have no idle mockers at my table. Now, we'll say no more about it. Show him all the kindness in your heart—but remember, you are not to go seeking him at the cabin. After

to-night he is one of the force till he shall win home by the right road."

Dolly blushed redder and redder till the smarting tears stood in her eyes. She could not speak, or she might have had occasion to repent her words; neither would she leave the room while her heart was swelling with resentment of Alan's punishment. She looked up presently and smiled, with an effort at firmness, in the face of the judge, who was also the father. He thanked her with a speechless look. He had not thought that anything could have eased him like that smile of his woman-child; but at midnight, sitting by himself, his thoughts went darkly back to Alan's offenses, which were all of a sort peculiarly offensive to himself.

"The lad shows neither sense nor judgment, nor the conduct of a gentleman," he said aloud, in the silence, which he was accustomed to address in moments of deep spiritual disturbance. "Let him go where plain lessons are to be learned of plain men. There is not a man in my employ but can set my son the example of all I have failed to teach him."

Dolly waited up for Alan as late as she dared, for fear of disturbing her father, who liked the house to be quiet always at the same hour. It then occurred to her that he might already have gone up to his bed. She went to his room and knocked, but got no answer. Her room was next to his, both opening by low, casemated dormers upon the flattish slope of the roof. She leaned out and saw Alan asleep on the shingles outside his window, his head and arms resting upon the sill. His attitude kept the expression of the mood in which he had flung himself down. She crept out upon the roof and knelt beside him, whispering a little, choking prayer. The heavens were dark; as she lifted her face one big drop of rain fell upon her forehead, the sole birth from that night-long wrestling of wind and cloud.

Drought prevailed, and toward morning the sky slowly cleared. The wind blew Dolly's curtains wide apart. A sunbeam, striking the mirror propped up on her dressing-table, made quivering rainbow-patches on the walls. A stronger gust blew something off the window-ledge, and, opening her eyes, she saw on the matting a huge, overblown giant-of-battles rose. Wrapped about the stem was a folded paper which explained itself.

I am not going to the cabin to take orders from my father's men. I'll pitch myself off the bluffs first. Father has been down on me this long while, so I may as well take myself off. They need not look for me in the river, nor in the low places in town. I am not going to play the fool, so no one need worry; and when I can show a decent bit of a record maybe I will come home. Good-by, Dolly; say good-by to good old Peggie. You

are the ones who will miss me. If ever I come back, it will be for your sakes. I was n't asleep when you kissed me last night. I did n't mind it, but I did n't want to talk. Yours ever,

ALAN.

P. S. I shall not use my father's name until he takes back some things he has said. So you need n't go through the papers looking for news of one Alan Dunsmuir, for there 's "nae sic" a person.

With much hesitation, on account of its flip-pant tone, Dolly showed her father this message. Dunsmuir devoured the words with but one thought; it was little to him now, the lad's truculence or the spirit in which he bore himself under correction. The one agonized question pierced through all that could wait:

"My son, where is he?"

They traced him to town, where he and Modoc were well known. He had borrowed a small sum of money of Peter Kountze, whom he had met at the Green Meadow, and had asked to be directed to the camp of engineers doing preliminary work on the Lower Snake; and thither, next day, they followed him. The search-party were informed that on the previous day a young stranger, light-haired, tallish, riding a pinto pony, had come down that way, asking for Philip Norrisson, who had never been with that division at all. The transit-man had told him that Philip Norrisson's party was in the mountains a matter of two days' journey from the camp. The young stranger, who gave his name as Robert Allen, had slept in camp and struck out early next morning for the mountains, expecting to reach the stage-station at the Summit by nightfall.

When the question was asked, What had he talked about the evening before? it was remembered that he had said he was intending to try for a position on Philip Norrisson's party; and when objection had been raised that the reservoir party would soon be through work and back in town, he had replied that it was no matter; Norrisson was a good fellow, who would be sure to put him in the way of something he could do; he was ready for anything. Peter Kountze, being further questioned, reported that Alan's first plan had been to strike for the coast, where he proposed to ship aboard a sealer bound for the Bering Sea; else to work his passage south on a San Francisco steamer, and to take the chances in that direction. Peter modestly admitted that he had tried to dissuade Alan from these projects, and, failing, had refused to lend him money more than sufficient to keep him a few days, if he stayed near home. Alan had then endeavored to find a purchaser for Modoc, but without succeeding in getting anything like what he considered a fair price. So it appeared his

designs were somewhat vague and fluid as yet.

No time was lost in following up the reservoir party; but neither at the Summit nor from any of Norrisson's men could a word be learned of Alan. No one had seen or heard of him since he turned his back on the tents and struck out across the sage-brush. At the engineers' camp on the Lower Snake all news of him ceased as if the plains had opened and swallowed him. In Alan's case a wild figure of speech had come literally true. The boy's brown cheeks were whitening in one of those oubliettes which occur as part of the black lava formation that is the floor of the Snake River plains; a floor continuous and solid for the most part, but strangely cracked and riven, undermined in places, and pierced with holes resembling the bull's-eye of a vault. Into one of these traps Alan had descended; no one seeing him go down but Modoc, who stood long, and waited, and tugged at his rope halter, and pawed the dirt and stones, and neighed to his master in vain.

#### IX.

THE evening Alan camped with the engineers some of the boys were telling stories around the fire in front of the office-tent. They spoke of the wonders and mysteries of the great lava desert, which mantles in dust and silence all that region north of the Snake for four hundred miles of its course between river and mountains. Camp-fire gossip, in these arid lands, runs much upon discoveries of water, as in the mountains of the same region it runs upon rich finds of gold. One of the boys who had been a stock-herder told of a pool or well in the heart of the Black Lava the water of which was fresh, though defiled at the time of his discovery by carcasses of dead cattle; the poor beasts, mad with thirst, had crowded upon it when all the streams were frozen, and perished through overweighing the ice which covered the pool. The depth of it was unknown. It was said to go down to the level of that fabled underground valley of the Snake, where, beneath the lava crust, imprisoned streams, identical in source with the river above, were tunneling their way to daylight.

It was said that in certain places these subterranean waters gushed out from beneath the lava bluffs in fountains of white foam, bringing fertility to some chosen valley, located, perhaps, by a refugee Mormon with a keen patriarchal scent for pasture, or a road-weary plainsman who here unshipped his wagon-top, and turned loose his lean stock and his tribe of white-headed children. It was loosely ventured round the camp-fire that rich washings of fine gold might be gathered from the beds of these hid-

den watercourses, in pot-holes or crevices where the sluicings of ages had been collecting.

Alan's eyes grew big at these tales. He asked many questions; in particular why these exciting presumptions had never been put to the proof. He was told that, in all probability, until that region had been scientifically explored they were incapable of proof. The few doors which opened into that mysterious cellarage were dismal traps not easy to find; and those best acquainted with the country were shy of meddling with its secrets. The river itself had a sinister reputation. The Indians never trusted their naked bodies to its flood; no old plainsman could be induced to pull off his shirt and plunge into the Snake, nor would he suffer a "tenderfoot" to do so in his presence without earnest remonstrance and warning.

Another of the boys claimed to be the discoverer of a cave which he compared to a vast sunken jug. He had come upon it accidentally, riding as messenger from camp to camp; had stopped only long enough to drop a stone down the pit-dark hole, where all was silence and airless night. The depth, from the sound, had been something awesome. Later, with two comrades, he had searched for the "jug" over every foot of the bare plain where he had tried to locate it by memory. They had ridden from town equipped with ropes and candles; but not that day nor ever afterward had he found the lost entrance to the cave. It had relapsed into the mystery that broods over the desert, the silence which it keeps, though the ear of man is ever at its lips.

The trend of the Great Snake River plains is distinctly toward the west. That way the mountains open to welcome the warm winds from the coast, which temper the winters of all that inland region. As summer advances and drought encamps upon the land, the visiting winds are succeeded by local breezes which blow with the regularity of day and night. It is then the great air-currents, rising from the burning face of the desert, beckon to the mountain-winds, and as punctual as a sea-breeze they come whooping down at night through cañons and passes of the foot-hills. No sleeper, upon the ground or under heated house-roofs, but is grateful for these night-winds; no sun-burned traveler, beneath the bright stars of the desert, but feels his strength renewed, bathed in that steady, balmy tide of coolness.

Alan rode out of camp after such a night of solid sleep, very different from the same night which his father had watched out in the cañon. It was the time of perfect equilibrium which comes twice in the twenty-four hours, once after sunrise and again about the setting of the sun. The silence of the desert was unbroken by bird or breeze or sound of footsteps, except-

ing the steady clink and shuffle of Modoc's hoofs getting over the ground in excellent cayuse fashion. The little horse was at home; his ears were pricked forward, his eye keen for the trackless way he knew so well. He kept edging northward toward the pass between the low, black buttes, standing apart like gateposts to the mountains; between them lifted a far, aerial vision of the blue Owyhees, and the War Eagle, wearing his crest of snow. The face of the plain was featureless and wan. There is but one color to this desert landscape — sage-green, slightly greener in spring, and grayer in summer, with a sifting of chrome dust. In winter it is most impressive under a light fall of snow, not heavy enough to hide the slight but significant configuration of the ground, yet white enough to throw into relief the strange markings of black lava, where it crops out, or lies scattered, or confronts the traveler in those low, flat-headed buttes, so human, so savage, in their lone outlines, keeping watch upon the encroachments of travel.

Alan had been in the saddle since seven o'clock, and it was now noon. He was looking about for a good spot where Modoc might pick a little grass while he ate his lunch. Nothing more quickly catches the eye in an uncivilized region than a bit of painted wood. Alan could not have passed by without seeing a broken wagon-tongue abandoned in the sage-brush; and this one had the peculiarity of a new rope cleverly knotted about the middle of it. The end of the rope disappeared in the ground. Alan stopped to investigate this mystery. To his inordinate delight he found that he was kneeling at the lip of one of those dry wells—perhaps the “jug” itself. No consideration known to the mind of a boy could have deterred him from attempting to go down. He took, however, a few simple precautions. He made fast his pony to a stout sage-stump. Modoc stood well as a rule, but his heart was traveling northward, and his legs might be tempted to follow. Alan then tried the rope; the knots held. The thought did strike him, with a slight chill, What has become of the man who tied those knots? He leaned his face above the hole and shouted; he would have been surprised indeed had he received an answer. He gathered stones and tried the depth by the sound of their fall. It was deep, but not so appallingly deep, and the bottom, from the sound, was perfectly dry. Of the shape or nature of the walls he could learn but little, because of their size and the smallness of the orifice. He pulled up the rope; it was, at a guess, a twenty-foot braided lariat, with a second longer rope spliced to the end of it: fifty feet, at the most, would cover the length of that swinging tether. He now collected a bundle of sage-

sticks for torches, small ones to light quickly and larger ones to burn longer. These he tied together into a fagot, which he dropped down the hole. To provide against accident to the precious bundle he fastened a torch-stick to his belt. Matches he had with him, but he felt in his pocket to make sure. He took pride in these precautions, so sensible did they strike him, so experienced and businesslike. His heart beat with expectation great and vague. Modoc watched his master restively; but without a glance at his pony, or a farewell pat, Alan put both feet into the hole, and his head was soon below the roots of the sage-brush.

When he had lowered himself about ten feet, his body began to oscillate with a slow, irregular, sickening motion. He felt himself miserably detached. He struck out with his feet, hoping to touch the sides of the vault; but he had now reached the bilge, and kicking did but aggravate the spiral movement, which became more pronounced and confusing as the rope lengthened above him. In another moment his toes touched the bundle of torch-sticks, his stretched muscles subsided, and he stepped free upon the floor of the cave. When a momentary dizziness had passed he looked up and saw the light of day above his head—a small, white star which shed no rays, but rather increased by contrast the palpable effect of the darkness into which he had dropped as into another element.

He made haste to light his torch. The flame spluttered and flared; he looked about him, and saw, to his horror, that he was not alone in the cave. The man who tied the knots had been watching him from the moment his body had darkened the hole. Alan had seen Juan Pacheco the homicide only once, by moonlight, at long rifle-range; he knew not a feature of him, but he was certain that it was he, the yellow Mexican, crouched upon the floor of the cave pointing a Winchester in his face. Pacheco, if he it were, seemed to recognize his visitor. He smiled a cruel, half-breed smile, displaying a bad set of wrinkles around the corners of his mouth.

“*Ven aca!*” he commanded quietly. Alan moved away from the hole.

“How many more come?”

“No one,” said Alan. “I am alone.”

Pacheco looked as if he did not believe him. A moment passed in silence, Pacheco listening, Alan breathing quick and hard.

“Hold up the light! *Mas arriba!*”

Alan held up his torch in both hands as high as he could, and Pacheco went through his clothes, taking from him his pistol, his cartridge-belt, and his precious matches.

“Sst! What is that?”

Modoc, stamping on the hard-baked ground,

was calling to his master with a loud, cheerful whinny.

"It is my pony, poor brute; he wants me," Alan explained.

"It is a good brute. You have tied him? Bueno, muy bueno!"

Alan did not know then why Pacheco should have called it good; but afterward he knew. He explained how he had come upon the hole by chance on his way across the plains northward to the Summit, which he must reach before dark. Pacheco seemed to attend, but from his face Alan could gather nothing of the effect of his words.

"Miguel Salarsono—is he dead?"

This was the man Pacheco had knifed. He was dead, but Alan hesitated at the truth, which Pacheco read in his eyes.

"*Esta bien*," he said coolly. "They want me. Where now Peter Kountze?"

"In town when I saw him last."

"What day you see him?"

"Long time ago," Alan lied, thinking it would be bad for him should he confess to having met Kountze the day before.

Again Pacheco read his face. He gave a dissatisfied grunt. "Put out your light," said he.

"It smokes," said Alan, "but it is better than no light."

"You are with one who knows his way," said Pacheco in Spanish. Alan barely understood him; but he thought to flatter Pacheco by seeming to know his language.

"I want to look around, now I'm down here. Rum place, ain't it?" he said, pretending to a cheerful curiosity he was far from feeling.

"You shall have plenty time."

"And plenty light, too, I hope."

Pacheco cut him short, roughly assisting him to put out his torch. He undid from about his waist a greasy silk sash, gave Alan one end of it, and kept the other himself. "*Anda!*" he commanded. "*Por aqui*," and he led on, Alan following at the girdle's length as best he could. Whether they were traversing a series of chambers connected by passages, or one long gallery of varying width and height, Alan could surmise only by the sound of their footsteps on the rock floor, which sometimes rang as between lofty walls and again fell dull and flat. He concluded presently that he was getting his underground eyesight, else the darkness was no longer absolute. Pacheco called a halt, and changed the order of march by putting Alan before him. The roof here descended to within a few feet of the floor. Alan could make out the shape of a low opening like the entrance to a drift, defined against a faint light beyond. They went down upon hands and knees, and crawled forward along

a narrow incline which rose to the level of what by contrast seemed a fair chamber; round, like a congealed bubble in the rock; not lighted, yet something less than dark, owing to a crack in the roof; deep, but narrow as a spear, through which a gleam of white daylight stole into the cell.

"I make you welcome, Señor Caballero, to this your house," said Pacheco, as they stood upright, in the dim oubliette, facing each other.

Alan struggled to be calm and to take the words, spoken in Spanish, as the language of compliment, at the worst as a grim joke befitting the place.

"*Muchas gracias, señor*," he responded, with a smile as wan as the imprisoned ray of daylight that touched his face. "It is a very good house. You are living here *secreto, retirado*, I understand. I can keep dark. It shall be all the same, I promise you." He spoke slowly, with extreme emphasis, that Pacheco might lose no word of his meaning. "I swear, it shall be all the same as if I had never seen you here. The cave shall be forgotten. Understand?"

"*Sí, sí*. All the same—after you get out." Pacheco grinned significantly, and Alan's heart turned over in his breast.

Beyond the cur-like upward glance of his covert eye and his occasional cruel smile, Pacheco's face relapsed into impassiveness. The man had been villainous by torchlight; he was ghastly now by the faint, white daylight, like one on whom the sun had not shone for months.

"How long—how long," Alan gasped, "have you been down here?"

"The light come fourteen time since the night I skip," said Pacheco, glancing upward at the crack in his dungeon roof.

"Alone?"

"*A mis solas*."

"Why don't you clear out—vamos? The country is big."

"It is very big, señor; and I have no horse."

"Where is your own horse?"

"He play out, three miles; he drop in the sage-brush. I am here very safe; by and by pretty hungry." He grinned and shrugged expressively. His philosophy of suffering promised as little pity for another as he wasted upon himself.

"Good God, man! does no one know you are here?"

"One too many know I am here," said Pacheco, ominously, laying his dark forefinger on Alan's breast. "You make one little fool of you'self when you come down that hole."

"I can go up again. I must go, Pacheco. My horse is dry. No water since morning."

"*Poco, poco tiempo.* When it is dark, I go up. I give him water."

"But I 've twenty-five miles to go before dark." Alan was shaking from head to foot.

"Sit down, *hombrecito.* Rest you'self. You have hunt me like jack-rabbit; now you have find me in my hole. What 's the matter with that?"

"God in heaven, Pacheco, my people will go mad!" the boy shouted, forgetting that no one would expect him that night or any night, that his absence was now a fact accepted by every one who knew him above ground. This last cold detail of his situation closed upon him like the silence that follows the echo of a dungeon door. He flung himself upon the Mexican with a captive's madness, throwing away every hope of pity, and grappling with him as his open enemy.

Pacheco carried a knife concealed at the back of his neck with which he might have finished the encounter, but murder was no part of his present intention toward his prisoner. He closed with the lad, hugging him in his arms, and the pair rocked to and fro and staggered about the dim place till Alan was thrown, dragging Pacheco with him, the back of Alan's head striking the floor of the cave with a sickening dunt. Pacheco freed himself, and Alan lay still.

## x.

DAYLIGHT had faded from the crevice when Alan came to himself. The cave was perfectly dark. He started up on his elbow, but fell back, giddy and sick and sore. It was some moments before he could summon courage to test the silence. No answer came to his first hoarse call; yet Pacheco might be in the outer cave. He called again, and listened, holding his breath, and hearing nothing but his heart beating like a clock. He shouted, he screamed, he sobbed, as a child awakened by a frightful dream that cannot make itself heard.

He lay all night at the mercy of hideous doubts and speculations which only the morning could set at rest. Had Pacheco gone? Had he left the rope? His flesh rose in chills, and again he burned and stifled with the torture of these questions. In his tossings on the floor of the cave his hand had struck against a pail heavy with a delicious weight of ice-cold water. He had splashed it over himself in his eagerness, dragging it toward him. In the morning he made a terrible discovery. All Pacheco's little store of food and candle had been set forth in plain sight for his successor's use; but the matches were ruined. Alan had drenched them in his transport of drinking in the night. For a moment he gave way again,

clapping his head, and sobbing, and rolling about on the floor.

He felt sick and bruised, and silly with weakness. His eyes ached, his throat and jaws were sore, his hair incrustated with blood from the cut on his scalp; but no bones were broken, and he knew that food would strengthen his heart. As he crawled about, gathering materials for a breakfast, he made a new and momentous discovery. Pacheco had left him a letter, of explanation, perhaps, or direction. But when Alan came to examine this sole link between him and the living, he found he could not decipher it. He had persuaded Pacheco too well of his linguistic acquirements; the letter was in Spanish, mongrel Spanish, brutally ill-written with a pencil on a bit of greasy, wrinkled paper bag which had refused to take the marks distinctly. Alan could have crushed, torn it; he could have killed Pacheco for inventing this new torture. He groaned, and put it away, and struggled to swallow some food, for a greater test of his nerve was before him. If Pacheco had left the way of escape open, why had he written a letter?

He had been led into the cell by the right-hand wall; he took the left going back. One hand he kept upon the rock, groping and shuffling forward, past angles and turns which he remembered, till he entered the great chamber with its one far bright star of blessed daylight set in the blackness of its roof. One instant he hung back; he dared not look: the next, suspense was past—the rope was gone.

All that day he sat in the twilight of the inner cell and pored over the letter. Sweat broke out upon his flesh, the agony of attention balked his memory, and his mind refused to act. The few words that he could read held aloof in maddening incoherency from those that were dark to him: "water—the white cross—the great cave—twenty days"—then something about *mi amiga*; the noun was feminine. And then the writer signed himself—"with the cheek of the devil!" groaned Alan, surveying the ghastly words of compliment to a doomed man—

With great respect, Your servant,  
JUAN PACHECO.

All day he hammered his brain over this diabolical message, and when he could see no longer he sat in darkness, and its goblin characters came out on the strained wall of vision and tortured him with guesses. He fell asleep repeating the words that led his mind a weary dance far into the night: the white cross—water. Twenty days, twenty days, twenty days.

Three times the light faded from the crack and came again, and, sleeping or waking, the word water had become the unceasing pang that

haunted his consciousness. He had counted his stock of food, and of candles, which were nothing without matches, yet might serve as food should he come to a rat-like desperation in the last stage of hunger; but he knew he should not starve to death. Every day while the wan light lasted he ranged round the walls of his cell; searching crannies and crevices and spots of shadow, listening, sounding for hollow places, stamping, and sometimes breaking out and howling like a trapped animal, all in an awful, breezeless silence, never altering from hour to hour, from day to day. By drinking sparingly at night and morning only, he made his precious pail last a week. On the eighth day he ate little, fearing to increase the desire for water, which had taken already the form of a nervous demand. The food which remained to him was of a thirst-provoking quality—a sack of moldy pilot-bread, some pounds of dried salt beef, several cans of cooked beans, a few dusty, gritty raisins in a paper bag. He had heard that small, smooth pebbles held in the mouth promote moisture, and occupy the mind of one suffering from thirst. On the ninth day he collected such pebbles as he could find and tried the effect of them, but without much enthusiasm for the result.

On the tenth day he made a joyful discovery. A greasy waistcoat of Pacheco's lay bundled in one corner of the cell near his bunk; Alan had never touched it; it had for him that personal association which made the sight of it repulsive. But this morning he took it up and examined the pockets in the sudden hope that he might find a stray match or two left by chance; and he was not disappointed. He found a good bunch of California matches united on one thick stem, which had worked through a hole in the waistcoat side-pocket, and lay concealed between the stuff and the lining. That day he explored the dark passage by candle-light. His tongue was so swollen that he could no longer swallow food. He had fever, and could sleep but little, and then was beset by morbid dreams. His strength was fast going. On the eleventh day he dragged himself into the outer cavern, wondering at his fatal mistake of wasting a whole day in the passage when the letter had named only the *caverna grande*. His legs would not bear him up to make the round of the vast walls; but he sat himself down on the floor, and lighted all his candles, placing them a little way off on the floor in sockets of drip, that he might get their combined effect without the shock of it in his eyes, which were tender to the light.

His face was as white as the candles, his blood-shot eyes were sunken and wild. He had picked at a roughness on the side of one of his fingers till the place was raw; he was

picking at it now as he stared before him. He had a crazed, broken sensation in his head; his mind labored and drifted heavily. He thought his senses must be going when, on a space of wall above him, where the light struck upward at a new angle, appeared a sign chalked upon the rock in the form of a cross. Trembling he looked away at the reality about him, at the place of his living burial, and then fixed his eyes once more upon the spot where the cross had appeared. It was still there. And below, at the meeting of the wall with the floor of the cave, there rested an immovable spot of blackness. He shifted his lights; the shadow did not move. It was the opening of a passage or burrow beneath the rock. Hands perhaps as weak as his had scooped it; and some doomed captive as desperate as himself had marked the spot with the symbol of suffering and of mercy in memory of his release from torment.

He crawled into the hole, keeping a lighted candle before him; only his panting breath stirred the flame in that lifeless air. Creeping forward on his elbows, guarding always his light, its soft ray fell upon a dark, sunken pool; on the brink of which he fell on his face and lapped like one of Gideon's three hundred.

The agony was over. Imprudence followed, and all the train of effects resulting from the nervous shock his system had suffered. He gained no strength; he lost, indeed, from day to day; and the twentieth day was at hand. He had made himself a calendar of match-sticks, which he dropped, one each time the light came and went, into an empty tin can, which thus became the repository of his great hope and his greater dread. When the match-sticks numbered nineteen, Alan laid himself down beneath the hole in the outer chamber, resolved to lie there till rescue came or death. On the back of Pacheco's letter he had scrawled a few words to his father, in case deliverance should come too late. Having eased himself of this last message, with a pail of water near, and such food as he could retain out of the little remaining of his poor stock, he lay and watched out the twentieth day and the night that followed, not daring to sleep. Another day passed, and the light faded from the hole, and he prayed that he might go before the morning watch, for the suspense was worse than death. He closed his eyes and went incontinently to sleep. The angels might waken him if help should come; he could watch no longer.

In the night a voice called him from above; it became part of his dreams, and turned them into nightmare; the call was repeated again and again, but he did not wake.

Then, with a prayer to Mary of the Mercies, a girl, kneeling by the hole, bound her long

black braids about her head, reefed her skirts, and, taking hold of the rope she had made fast, descended fearlessly into the cave. Pacheco's friend had come.

Alan crawled into the engineers' camp next morning as the boys were turning out of their tents for breakfast. They did not recognize in him the laughing, bright-haired stripling who had sat by their fire scarcely three weeks before. When they questioned him he fell to weeping like a baby, and said he had been in hell. And they remarked to one another that he looked it, every inch of him. And when he told them who he was, and where he had been, and how, while the bright days had passed unnoticed above ground, some of the broad-shouldered fellows were not ashamed to wipe their own eyes, complaining audibly of the camp-fire smoke. He slept all that day and night and far into the next day, and was roused with difficulty when they forced him to take such nourishment as they judged he required. But they might have let him sleep; nature and youth were taking care of him.

#### XI.

PHILIP'S return trip from the mountains was hastened by a letter from his father requesting his presence in town on a certain day of the month. He left his men to bring in the camp outfit, pressing on alone ahead of the wagons on horseback, and reaching town well within the stipulated time, tired as a hunter, but gay with the thought of the long mountain miles he had made at the word of command. He lingered over his toilet next morning, with a keen zest for the comforts of civilization after three weeks of gritty camp-life in boots, and corduroys, and crumpled flannels. It was luxury to put on a silk shirt and to brush his hair before a triple mirror. He trimmed the ends of his mustache, taking all the time which that delicate operation deserves; he examined critically the new barber's cut to which he had submitted himself the evening before at the Transcontinental. He perfected his outer man deliberately in every detail, and descended to breakfast in a brilliant humor of expectation for whatever new turn of the wheel had brought him back again to the affairs of men. Even the little new town, whose social note had struck him as so crude and stridulous, contrasted with the life of the hills, had gained quite a gay, civic, important air. He had amused himself with thinking of it the evening before, as he walked home by the white light of the electric lamps.

Philip had passed the ordeal, spiritual as well as physical, and was acclimated to the western movement. His father saw it in his glance, in

his bearing, as he walked into the room, and rejoiced that he could call the clean, high-headed young fellow his son. He would have liked to cuff him about a little and to clap him on the back, to take some of the starch out of him; yet the starch was well, so that there was "sand" underneath. Breakfast at Mr. Norrisson's was not a perfunctory matter of a roll and a cup of coffee, but a regular sitting in three courses, with conversation and good appetites. To the manner of this also Philip was acclimated; he needed no urging when the third course came upon the table, even when it included that ultra-Americanism, pancakes hot from the griddle. Mr. Norrisson's Mexican cook was a genius, at sixty dollars a month, and could turn his small dark hand to the cooking of any clime. (It must have been observed too often to be worth mentioning that men, when they keep house, will always have a cook, whether the closets be cleaned or not.) It was Enrique's pet grievance that Wong was allowed to make the coffee at breakfast. He listened at the window of the butler's pantry to hear his own praises when his creations were handed in, but when he heard praise of Wong's coffee instead, he swore strange oaths among his pots and pans, making the kitchen hideous with their clatter. Hearing echoes of the din, Wong would smile mysteriously, and pass Enrique's triumphs with sweet condescension. It was Enrique's revenge at breakfast to hasten out to the garden and to pick a bouquet for the table, well knowing that he alone of all in the house had the touch for flowers, and that Wong's efforts were simply insufferable. It was he who filled the lesser punch-bowl with roses or crisp nasturtiums dewy with their morning sprinkling; it was Wong who swore in the depths of his white, starched gabardine when he spied the insolent drops on his spotless cloth. He would have given a month's wages for courage to fling bowl and contents at the head of his fellow-craftsman. But out of these jealousies professional and racial came exceeding peace and perfection of service to Mr. Norrisson. It was his policy that the heathen should rage; that out of their dissensions he might make profit to himself.

"Has Alan Dunsmuir turned up yet?" Philip inquired.

His father was finishing his plate of California peaches. He paused and mopped himself before answering; he was a critical but not a dainty feeder. Moreover, he did not know at first to what the question referred; then he remembered.

"Why, of course, that must have been what Dunsmuir meant. He excused himself from the dinner we gave Westerhall; some family

matter; he did n't put it very plainly, but I saw there was trouble, so I did n't ask any questions. But I remember now. Young Dunsmuir was reported missing about a fortnight ago. What has he been up to?"

"I don't know at all," said Philip. "They sent a man after me to inquire if he had been with my party. I did not get a very clear idea what the trouble is, or what they are afraid of."

"Depend on it, if Dunsmuir has had trouble with his boy he's the one to blame. He'd be sure to buckle the curb too tight. You will have to remember his arbitrary temper when you come to work with him. However, you are cool enough, and you have a manner that will flatter the old sachem. But you must look out and not carry etiquette too far. We'll get through with Wongy Pongy before we begin on business."

When the last dishes were on the table, Wong was ordered to tell Simpson that the horses would not be wanted that morning. "Now," said Mr. Norrisson, "shall we smoke here or outside?"

"I am very comfortable," said Philip, helping himself to one of his father's cigars.

"Well, I must tell you the circus has begun. In fact it's pretty nearly over. We have had our season of wrath and bitterness. Dunsmuir is not so topping as he used to be; whether it's this break his boy has made, or what, he's not the man he was. Crotchets play the mischief with a man's powers. Westerhall arrived, as you know, last week," Mr. Norrisson went on. "We got together after a few preliminaries, and we offered Dunsmuir a slice of the stock. But we made it pretty plain that we proposed to dispense with his services as engineer, 'Gentlemen,' said he, 'this is a very fair offer you make me for my resignation. But I intend to build my own canal. I have staked my professional word on the verity and importance of this work, and I shall see it done, and honestly done,'—mark the point he always makes of his honesty as against our supposed want of it,—'if it be the last work of my life. This may not strike you as business,' said he, 'but it is where the business hits me.'

"At our next meeting I showed him that he had nothing to sell. He had shown his hand to Westerhall, and all he had was the opinion of Marshall & Read, his lawyers; and on that very opinion we based our claim. Now there were two clauses to it: Dunsmuir read his title by the first clause, and we took the second and read it just the other way; and yet it was a sound, well-considered judgment by two of the ablest men we have out here. It came about to this: Dunsmuir's claim was good to build on; it was good for nothing if it lay idle, and we

went ahead and built the canal. Water belongs to the man who uses it. We claimed his location, *and shall hold it*, on the ground that we are ready to build our canal now, while he is only pottering at a rate that will not see his finished in half a hundred years. He took occasion to remind me, right there, that our company's policy had been one of obstruction 'unscrupulous and persistent,' else his ditch might have gone through years ago. And I endeavored to show him that it was *his* policy of antagonism which had antagonized us; that he might have gone in with us had he chosen, and saved all this friction between us. Here he shut up and would say no more. He had got very pale, and his hands shook as he gathered up his papers. He looked as if he had n't slept for a week. I wish, confound it, I had known, or remembered, about this trouble with his boy. Handsome little rascal! I used to see him around town cutting up all manner of cowboy capers on that spotted pony of his. What did you say he's been up to?"

Philip explained again what he knew of the circumstances.

"Well, I wish I had known. Dunsmuir's badly strapped, I hear. I might have offered him some help in the way of his search. Or we might have waited a little—well, we could n't wait. Westerhall understood there would be trouble, but when we came to talk it over I could see he did n't want to leave Dunsmuir out in the cold; though, as I said to him, a man who won't accept any terms but his own, or any facts but his own as to his real position, is a difficult man to deal with.

"'But we must give him something,' said Westerhall. 'He is too poor to get out of the country, you say, and he is too strong a man to be left in black dudgeon here, to head every movement against us in the future. He must be included in some way.'

"'How are we going to include him?' said I. 'We tried him fifteen years ago, but he would n't be included on any reasonable basis. He stood off and called us swindlers. Now we are jumpers. It does n't make a happy family,' said I.

"'Give him the work,' said Westerhall; and he showed me there was a feeling for him in London, where his Indian record is on the blue books, and it counts with them, of course, that he is an M. I. C. E. And then Westerhall and I had it for the rest of the day.

"But, as you may have observed, I am a man of compromises. This is the way I put it to myself: Suppose we make Dunsmuir our chief engineer, not at his demand, but as a point we yield out of generosity to a broken man. He knows I don't want him on the work, that I have refused to have him. Now if he takes that

offer from our company, the man is ours. I am the manager of the company."

"How can you subsidize a man by giving him his own? Will the legal aspect of Dunsmuir's claim affect its justice in his own eyes?" asked Philip.

"It does not now; but his light will grow. Property that has no existence in law can't be peddled about under the name of a water-right. I think he has had his misgivings that his claim was wearing pretty thin. Observe, he never consulted his lawyer till the other day, when he knew he had to; he did n't want to be too sure. It's the nature of dreams to look queer by daylight. Dunsmuir's fifteen years' fight will look very strange to him six months from now. However, it makes no difference to me; let him take our offer, or walk off with his pride and an empty pocket."

"What is it you propose to offer him, now?"

"Make him chief engineer and give him a little stock."

"And how will you put the offer of stock to a man who has no rights in the scheme?"

"We shall put it this way: Parties might have got hold of that location who would have given us more trouble than you have; who would have forced us to build before we were ready. This is to pay you for keeping up the right for us."

"That is very clever," said Philip, who thought it infernally clever; "but Dunsmuir will take it as a taunt. You can never compromise him through offering him a share in his own scheme. You might as well try to suborn an author, offering him a royalty on his book."

"Yes, yes; I know the pride he has in his design, his responsibility, and all that. But his plans went out of his hands in our first deal. He will find, after a while, that he is being taken care of on this scheme, and that I am taking care of him."

Philip rose from the table and walked to the open window, where the purest of morning breezes drifted in from the fields of blossoming alfalfa.

"Why does your company want to own its engineer?" he asked.

"I am the company here," said Mr. Norrisson, disdaining the shelter of the collective noun; and for the first time in his various expositions of the dispute between himself and Dunsmuir he showed the bad blood he had always attributed to Dunsmuir alone.

"I submit that it will never occur to Dunsmuir that he is being 'taken care of,'" said Philip; and he triumphed in the thought. His sympathies were with the man of his own profession. "The work is his by every right of discovery, of design, of fitness, and of sacrifice.

Why should he not take it? Who is the man that can say, 'I gave it him in pity for his delusions?'"

"He will take it, that's what I say," scoffed Norrisson. "He will take the stock, too. He knows the worth of money, and he knows the need of it. What shall follow remains to be seen. I am satisfied, remember, though I seem to have backed down on a vital point. Dunsmuir is chief engineer; well and good. And my son will be his first assistant. How does that strike you?"

It struck Philip in so many different ways at once that he could not choose instantly the best answer—the truest—to his scruples, his doubts, and his deep, excited joy.

"May I ask, sir, if this is part of the 'deal'?" was what he said.

Mr. Norrisson answered indirectly. "It is understood that you are to have the position."

"Whether Dunsmuir wants me or not? I should find it unpleasant to be foisted on my chief."

"You are not supposed to know it. I need not have told you; but it's impossible to foresee what you will shy at next. We have another meeting fixed for this afternoon," Mr. Norrisson added, rising, and touching the bell. "We shall put in our final proposition as I have stated it. I want you there. I want Dunsmuir to see you before he's had time to take a prejudice."

"I must ask you to excuse me," said Philip, decidedly.

"Why excuse you? It was for this I sent for you."

Philip, who coveted Dunsmuir's favor for reasons too delicate, too personal, and as yet too vague, to be spoken, had no resource but to bear his father's contempt for what must appear merely another instance of coxcombry belonging to the schools.

"What the devil is it now? You are as mysterious as a woman!"

But nothing would induce Philip to go near those embittered men in council, committed to the side which he was not on. He entreated that his name be withheld for the present. Let Dunsmuir's affairs be settled first.

"It won't take half an hour to settle that," said the man of business. "I want to know if you will take that place; for your name will come up whether you are there or not. You will do as you please about that; the other matter I want settled."

"I will take it gladly, provided Dunsmuir be left free to discharge me as he would any other man's son, if my work should not suit."

"Very well," Mr. Norrisson assented, with the smile of a patient man who is nearing the limit of his pet virtue. "We will put it that

way then. You don't want to be 'taken care of,' either; is that it?"

Philip did not explain. His father was, on the whole, more amused than displeased by his coyness. It was, as he understood it, partly the youth's high conceit of itself, and partly the kittishness of a proud young novice in business, unacquainted with the practical nature of a 'deal.' However, as they left the house together he felt called on to straighten the young man's views on one point.

"'Foisted' is a good word," said Mr. Norrisson, "but it does n't apply to a straight demand that my son, a graduate of the Polytechnic, and the very man for the place, should have it. You understand?"

"I do," smiled Philip; "and I take back the word. And, frankly, I know that I can do the work; but I want the relation to be a pleasant one, and I don't want it to begin to-day in the midst of a discussion which may, or may not, take a happy turn. Give me time, and a fair show of pleasing my chief, and I think we can hit it off."

"There is sense in that; and it's your concern, the social part, not mine. The cañon will be your headquarters, and you don't want to live there in a bees' bike. They're a set of outlandish, prejudiced exiles, anyhow. It's all right; I sha'n't hurry you."

While Philip was dressing for dinner that evening there came a summons from the telephone. He hurried into his clothes, and went to the tube. The call was from the company's office: one of the young men wishing to know if Dunsmuir were in town, or if any of his people were in. Philip could not say, and asked who wanted Dunsmuir.

Answer came: "His son."

"Where is his son?"

"Here. Came in to-night—engineers' team from camp."

"What camp?"

"Fielding's—Lower Snake."

"Ask him to come up here."

After an interval the reply was: "Can't do it. He's all broke up."

"Get a carriage and bring him, some of you. I'll find his father."

Philip rushed over to the stable where Dunsmuir kept his team; the horses were being put to. The stableman said Dunsmuir's orders were that his rig should be at the Transcon. by six o'clock. It was then ten minutes to six.

Philip jumped in beside the man, and they drove to the hotel. He was shown at once to Mr. Westerhall's rooms. The door of the parlor, at the far end of a long corridor, stood ajar, and a voice which he took to be Dunsmuir's was thundering. He could not avoid hearing the words:

"You are in this scheme, gentlemen, for your money's worth; I am in it, now, for the sole sake of my work. Is it likely you will tamper with that? Your guarantees I have nothing to do with. I will be bound by no time-limit of your making in *my* deal with powers that are beyond your cognizance."

"I don't quite tumble to your talk of revenge," said Norrisson, apparently in reference to some previous threat of Dunsmuir's. "How, if it's a fair question, would you propose to take it? In the courts, for instance? Because I can tell you—"

"In the people's court of the elections—I could meet you there. Bear in mind, all that your farmers want to make head against you is a leader—a man who knows something and who has nothing to lose. I have heard a word of buying their representatives; maybe those gentlemen, whose politics are in their pockets, may think to buy me?"

Philip knocked twice before his father shouted "Come in!" The men were all on their feet; Dunsmuir pacing the floor, his gaunt cheekbones reddened, his blue eyes blazing, his gray-golden hair tumbled on his head as by a wind of strife. He wheeled upon Philip, who, as no one spoke to introduce him, was forced to come bluntly out with his errand:

"I have the pleasure to tell you, sir, that your son is in town. He is at the office, asking for you."

"My son? What office? Who is this youngster?" he demanded of the company generally, without taking his eyes from Philip's face.

"My son. Your engineer, Dunsmuir, the boy I was telling you about."

Dunsmuir took no notice of Philip in either of the given characters.

"Is it a waif word you bring?" he asked, with a tremor in his deep-strung tones; "or do you come from my son, himself?"

"I bring you the message as it came by telephone from the company's office. He was there fifteen minutes ago, asking for his father. They said he was ill, and I took it on me to have him brought to our house. He will be there before we can get there. Your team is below."

"Man, are you sure here is no mistake? I cannot bear to be jostled by such news if it be not the truth." He spoke harshly, lapsing into his Scotch accent, and Philip answered as to a woman:

"Shall we not go and see?"

Dunsmuir began to look about the room for his hat and coat. He was holding hard against the heart-shaking message, but there was a mist before his eyes. Philip helped him to his things, and almost put them on him. He found a pleasure in waiting upon him, and the omen was

a good one, though he did not think of it at the time. In silence the other men drew near, and shook Dunsmuir by the hand.

"I have n't been able to tell you how I have felt for you, Dunsmuir, in this business of your son," said Norrisson the father; and said Westerhall, who had a little fair-haired lad of his own across the water:

"Our toast to-night shall be, 'Our boys; God bless them!'"

In the wagon, driving through the streets, Dunsmuir spoke, charging himself that he must get him a man to carry a message to his women-folk waiting in the cañon. "If this news be true, they cannot hear it too soon," he said.

"I will be your man," said Philip.

"Will you so? Let it be your first order,

(To be continued.)

then, my bonny chiel! I have been fighting against you, I confess it; I wanted no manager's son on the work. And here you come with your coals of fire! I shall be in bonds if the mercies hold; there 's nothing slackens a man's war-grip like the thought, My God has remembered me."

Philip might have asked himself, had scruples been in order, Would Dunsmuir have made him his messenger to the cañon that night had he known how keen he was for the errand? A joy that was not all enthusiasm for the work was rising in his heart: already he saw himself on the darkling road; he was entering the cañon by starlight; he saw the lights in the waiting house, and a girl with startled, soft gray eyes was thanking him as his news deserved.

Mary Hallock Foote.

## BODY AND SOUL.

HERE at life's silent, shadowy gate,  
O Soul, my Soul, I lie and wait;  
Faint in the darkness, blind and dumb,  
O Soul, my promised comrade, come!

The morn breaks gladly in the east;  
Hush! hark! the signs of solemn feast:  
The softened footstep on the stair;  
The happy smile, the chant, the prayer;  
The dainty robes, the christening-bowl—  
'T is well with Body and with Soul.

Why lingerest thou at dawn of life?  
Seest not a world with pleasure rife?  
Hear'st not the song and whir of bird?  
The joyous leaves to music stirred?  
Thou too shalt sing and float in light;  
My Soul, thou shalt be happy—quite.

But yet so young, and such unrest?  
Thou must be glad, my glorious guest.  
Here is the revel, here is mirth,  
Here gayest melodies of earth;  
Measures of joy in fullness spent;  
My Soul, thou canst but be content.

Is this a tear upon my hand?  
A tear? I do not understand.  
Ripples of laughter, and a moan?  
Why sit we thus, apart, alone?  
Lift up thine eyes, O Soul, and sing!  
He comes, our lover, and our king!  
Feel how each pulse in rapture thrills!  
Look, at our feet the red wine spills!  
And he—he comes with step divine,  
A spirit meet, O Soul, for thine.

Body and Soul's supremest bliss—  
What, dost thou ask for more than this?

Stay, here are houses, lands, and gold;  
Here, honor's hand; here, gains untold;  
Drink thou the full cup to the lees;  
Drink, Soul, and make thy bed in ease.  
Thou art my prisoner; thou, my slave;  
And thou shalt sip wherein I lave.

Nay? nay? Then there are broader fields,  
Whose luring path a treasure yields;  
Thou shalt the universe explore,  
Its heights of knowledge, depths of lore;  
Shalt journey far o'er land and sea;  
And I, my Soul, wilt follow thee;  
Wilt follow—follow—but I lag;  
My heart grows faint, my footsteps flag.

And there are higher, holier things?  
Is this a taunt thy spirit flings?  
What is it, Soul, that thou wouldst say?  
Thou erst had time to fast and pray.  
Give me one word, one loving sign,  
For this spent life of yours and mine!

I held thee fast by sordid ties?  
I trailed thy garments, veiled thine eyes?  
Go on, I come: but once did wait,  
O Soul, for thee, at morning's gate.  
Canst thou not pause to give me breath?  
Perchance this shadow, Soul, is death.  
I stumble, fall; it is the grave;  
I am the prisoner; I the slave;  
And thou, strange guest, for ay art free;  
Forgive me, Soul; I could but be  
The earth that soiled, the fleshly clod,  
The weight that bound thee to the sod.

Dust unto dust! I hear the knell;  
And yet, O Soul, I loved thee well!

Emma Huntington Nason.

## THE FINDING OF THE TOMB OF ARISTOTLE.<sup>1</sup>

I SHALL never forget two aphorisms given me by an old grave-digger in Greece. He was one of a class that corresponds very much to the old-fashioned poacher in England and on the Continent, in whom the illegitimate pursuit is not only followed for gain, but has become an exciting sport, a wild instinct with a touch of the romance that hovered round the gentleman of the road and the bandit. He had followed his favorite pursuit in all parts of Attica, in Bœotia, and in Eubœa, and had sold many a beautiful object of ancient art and craft to the Athenian dealer, which objects, no doubt, are now ornamenting some museum of a great European metropolis. As such excavation is forbidden by law, and as the exportation of all objects of antiquity found in Greece is also forbidden, he had twice suffered confinement in prison for a considerable period; and this in spite of all his shrewdness and caution, for he did nearly all his digging at night. He had now turned his hand to honest work, and had become a workman in our corps of excavation, in both Bœotia and Eubœa. Though he was invaluable in cautiously clearing away the soil that had been massed in a tomb, and thus extracting without a breakage a delicate vase, or a piece of gold-work, or a bronze mirror, it was just as well always to keep a strict watch over his every movement; for, having extracted securely from its hiding-place in the earth some valuable object of antiquity, he might also return it to some hiding-place of which we knew not, which would be even more secure than was the accumulated soil, so far as any chance of our getting it again was concerned. But I shall always be grateful to him for the two epigrams which he gave me one day, and which are, in a way, fundamental and most important lessons for any archæologist who intends to excavate.

I was maintaining to some colleagues that there was sure to be a wall under a certain configuration of the soil, to which opinion I was led by a series of arguments archæological and practical, and to strengthen my own position I appealed to old Barba Spiro for a confirmation of my view. He looked at the spot for a long time; then gave a side glance at me; then scratched his head, and, fixing his eyes on one button of my waistcoat, he enunciated two short phrases: “‘Ο καλύτερος ἀρχαι-

ολόγος εἶναι ὁ κασμάς,” and “Σκάψε ἔως τὸ στερρό,” the first meaning, “The best archæologist is the spade,” and the second, “Go down to the native soil.”

I believe it was chiefly owing to my remembering these two aphorisms, and acting upon them, that I succeeded in discovering what we may now call the Tomb of Aristotle. Though a considerable amount of archæological study and reasoning, a careful working through of all the ancient and modern authorities on topography, a collection of all the passages in ancient authors dealing with the works of art which once existed in a certain district, and innumerable other considerations of a more theoretical nature, must precede the choice of any site of excavation, and must continually be present in the mind of the excavator, it is, after all, the act of digging itself, and the unbiased examination of what the spade and pick may turn up, upon which the archæologist must chiefly rely. And if the naturalist in examining any object in nature, or any member of an organic body, whether with the naked eye or under the microscope, must guard against the “personal equation,” the archæologist must be equally careful not to allow his preconceptions and his own desires to warp his vision and examination of the objects which his excavations lay bare. The second advice is almost still more important. He must never be satisfied with what he has found, nor cease from working when he has not found anything, until he has reached the virgin, the unworked, soil. It requires considerable experience to distinguish between worked and unworked soil, and it is important that every archæologist should inform himself of this difference, and practise the art of distinguishing between them with eye and hand. When there are small fragments of pottery or building-material to be found mixed in the earth, it is plain sailing; but when these indexes are wanting, it becomes much more difficult, for the characteristics of virgin soil vary with the actual nature of the earth in different parts, and the workmen are often more easily discouraged through unsuccess than is the morally and intellectually superior archæologist, and are prone to cry out, “Στερρό!” (“Virgin soil!”) long before they have really reached it.

However full of moments of thrilling excitement—moments that in their intensity have no equal in any other department of scientific work or of sport—the practice of excavation may be, there are days and even weeks of

<sup>1</sup> The pictures in this article are made from photographs taken by Mr. and Mrs. Gordon Oswald.

discouraging ill success, which sorely try the patience of even the most sanguine and persevering. Thus perseverance is one of the qualities most needed by him who would dig for antiquities. But often there may be a call upon more active qualities, physical and intellectual, than perseverance, in order to withstand the serious hardships to which excavation in some parts of Greece must necessarily expose the digger. The excavations of the American School of Archæology of Athens at Eretria in Eubœa during the months of February and March of last year, one of the results of which was the discovery of this interesting tomb, certainly were accompanied with severe hardships to all who took part in them. My colleague, Professor Richardson, who joined me in the second visit, during which we suffered most,—owing to the unusual inclemency of the weather,—assured us that during his winter campaign in our own civil war he had not encountered such discomfort.

My first trip to Eretria, leaving Athens on February 1, was comparatively an easy one. It consisted of a two-days' ride across Attica, till we reached the harbor of the ancient Oropos, on the narrow strait, called Euripus, which separates Eubœa from the mainland, and immediately opposite Eretria. Our sail across the Euripus, which ought to have occupied but an hour and a quarter, took six hours, during which we had to rely upon the clumsy rowing of the fishermen who owned the heavy boat which carried us across. Dusk was just beginning to set in, and with it came rain, as we landed in the picturesque harbor of the small deserted village which now occupies the site of the proud city of Eretria, at one time the rival of Athens in prosperity and power. Situated on this narrow strip of sea, which looks like an inland lake, this plain, once so fertile, is bounded on the west by a range of mountains, beautiful in outline, while across the strait rise the classical hills and mountains of Attica and Bœotia, with Parnassos looming dimly in the far distance. This spot is at all times one of the most strikingly beautiful in Europe. Yet even the surpassing beauty of the site could not dispel the disappointment and annoyance which gained on us as we proceeded to make arrangements for a prolonged stay.

Mr. Fossum of Johns Hopkins University, Baltimore, a student of the School, who labored with enthusiasm and skill during the whole period of the excavation, had preceded us by a day, and was at the harbor to meet us. He was accompanied by a black-bearded man of western European appearance, who wore a gray ulster and a shooting-cap. At first sight he looked more like an Italian than like a Greek. I soon found that he was thoroughly Europeanized, and at

one time had been Greek vice-consul at some Italian port. He spoke Italian fairly well. He had proved hospitable to Mr. Fossum, and was very affable and effusive in his greeting to us. I at once asked for the *demarch*, or mayor, of the town, and was told that I should presently be taken to his house. I knew it was an important matter at once to gain the friendly coöperation and assistance of this the chief functionary in the district. Mr. Fossum, aided by his host, had already explored all the resources of the town, and had found them worse than scanty. Unlike all other villages, even in the remotest parts of Greece, it appeared impossible to find any peasant or inhabitant who for good pay would migrate to some kinsman's house, or allow himself to be relegated to the ground-floor of his hut, leaving to us the upper room, which is approached by wooden steps from without, to clean and to furnish with our camp-beds. The reason for this was that there were but few thrifty and working inhabitants, and most of the houses had been deserted. We looked at two of these deserted houses, but with the rain that had fallen, with no window-panes, with a broken-down fireplace and a rotting floor, they presented so miserable an aspect, and looked so unwholesome, that we could not think of making either of them our headquarters. We were not much comforted when we learned that the cause of this desertion was the unwholesomeness of this fever district.

It was one of the great, but equally unpracticable ideas of the late King Otho of Greece to transplant to this site of the ancient Eretria the brave inhabitants of the island of Psara (when, after the war of independence, this Greek island was not added to the Hellenic kingdom), granting to each a large piece of land, and laying out a city by the ancient harbor. In keeping with his generous though visionary character, the king undertook the work on a large scale. Engineers were called in, and laid out the city with broad streets and open squares, which, even at present, though there are only ruined houses and but few inhabitants, bear the names of University street, Marine Square, etc. He even proceeded to build there a large nautical school, which was meant to rear future mariners and admirals, and which now, without a roof, and with crumbling walls, stares with tragic irony at the deserted houses, a monument of noble quixotism. The energetic and vigorous members of this new Psara soon left, and are scattered over Greece and in distant parts of the globe, and have, many of them, amassed great wealth, retaining considerable pride in the patriotic traditions of their Psarriot ancestors. The few hundred that have remained, chiefly women and children and old men, are unthrifty in character, with health

impaired by continuous fevers, and with faces that have malaria written upon them. Winter, in spite of the inclemency, was thus the safest season for the work of excavation.

The cause of all this unwholesomeness, from which, it must be known, Greece is comparatively free, are the swamps, close to the village, running down to the sea. Up to the present, whether from want of actual means or of energy, the proper steps for draining these swamps have not been taken. It is interesting to know that more than two thousand years ago, during the flourishing period of ancient Eretria, there appeared to be similar difficulties, with which the ancients coped successfully. Some twenty years ago an inscription was found at Chalcis which recites that a certain Chairephanes proposes to the Eretrians to drain the marsh. He himself will bear all the expense, on condition that he is allowed to cultivate the reclaimed land for ten years at a rental of thirty talents, to be paid to the city. The work is to be completed in four years. The citizens are to swear in the Temple of Apollo Daphnephoros that they will observe these terms, which terms and undertakings are to be inscribed and set up in the same temple. In case of war the ten years are to be lengthened by a period equivalent to its duration. Provisions follow for compensation to private persons whose land is taken, and for the making of a reservoir and sluices for irrigation. The concession is to be continued to his heirs in case of his death. Penalties are fixed for persons interfering with the execution of the work. Chairephanes, on his part, is also to furnish sureties for the execution of what he undertakes. The recital of the terms is followed by the decrees and oaths necessary to give effect to them, and then follows a long list of names, perhaps of persons who took the oaths. The date of this inscription has been settled as between the years 340 and 278 B. C.

But the knowledge of the difficulties with which the ancients had to contend did not lessen those which stood before us. I felt that the demarch—who has more or less absolute authority, acting as judge, and often as tyrant, in this district—was the only person who could help us, and I was astonished that he had not come down to the harbor to meet me. As a rule, the arrival of a stranger, especially one engaged in official work, is a matter of considerable excitement, and there is a formal reception by the local authorities, who act with most unbounded hospitality, and, if treated in the proper way, are of great service. I felt that our guide was not too eager to take us to the demarch, and it was only upon my emphatic demand that I was brought to his house. After the customary cup of coffee and spoonful of

jam had been offered us, I at once noticed the exceptional coldness of the demarch, who looked like a venerable and kindly man, and I realized that some mistake had been made. It was not long before I fathomed it, and further acquaintance with circumstances and personalities made it all clear.

I do not think there is any other country where political feeling, both local and central, runs so high as in Greece. This warmth of political passion is still more intensified by the fact that, in the choice of all candidates in this representative government, the family and its relations of kinship form the essential guide. And when it is borne in mind that nearly all the offices, local and central, down to the postmen and the attendants at museums, depend upon the success of each party, and that the family will at once run to their own member of parliament to help them in releasing one of their kinsmen who has been convicted of a crime, it will be understood how, in a small community where there are no industries but precarious agriculture and fishing, the political differences permeate every nook and cranny of daily life. This fact the foreigner who would excavate in Greece must always bear in mind. In dealing with it he must, from the very outset, manifest kindness, fairness, and firmness; and he must succeed in impressing these three qualities upon the people with whom he is dealing, so that they at once feel and are drawn out by the kindness, gain absolute faith in the fairness, and learn to realize and depend upon the firmness. The excavations of a sister institution in Greece have on several occasions been retarded, and almost completely suspended, owing to the charge (of course, unjustified) brought by the local authorities against the excavators that in the choice of their workmen they had been partial to that one of the two political parties which was not then in power. To mend matters, they made a further mistake in agreeing to see that half the workmen were chosen by a representative of one party and half by a delegate from the other, which of course led to further quarrels.

Now it soon became clear that Mr. Fossum's host, who had proved so affable and kind to him, was the brother-in-law of the previous mayor, and was himself aspiring to the mayoralty, and that there was an intense feud between the mayor in power and the party of his predecessor. When the mayor had been partly roused out of his mistrust and sulkiness he confessed that if we desired help and workmen we should go to the others, who, he informed us, were using us to gain popularity among the inhabitants. The difficulty was increased by the fact that, so far as practical help was concerned,

the mayor's enemy, with his influence over the greater number of the workmen, and the greater practical readiness which he had acquired abroad, could not be dispensed with. It was, then, our aim, while acquiring the friendship of both parties, to turn their animosity into rivalry as to who could help us the more. We brought both parties together, and made them a simple speech, in which we told them that we had not come from America to practise Greek politics, and could assure them that we had enough of that kind of thing in our own home; that we were friends of both parties, and came to confer a boon upon the place, as many years ago our fathers had actively helped the Greeks in their struggle for independence. I may say that an appeal to these memories always strikes on fertile soil among the Greek people.

They can never forget the ship-loads of provisions and clothing that were sent from America during their war for independence. We further assured them that they would always find us fair, and that what we wanted were good workmen of whatever party. If they worked well they would be retained; if they worked badly they would be rejected. If they suspected our foremen of unfairness they could always appeal to us, where they would meet with justice; but that dig we would, and that without delay, and we counted upon their help, and felt sure they would not belie the hospitality for which they were noted. That evening Mr. Fossum dined and slept with the anti-mayor party, and I dined and slept with the mayor, who, after a frugal dinner, with an ample provision of resinated wine, waxed more and more cordial, and gave us reminiscences of his former life as captain of a brig. All his ancestors had been seamen, and his father's brig was the first Greek sailing vessel to enter an American harbor.

The next day we found our workmen, and even two horses with carts, and at once began our excavations at the theater, which have since proved so strikingly successful in disclosing remains that have a most important bearing upon the much-debated question of the arrangement of the Greek stage. The work having fairly started, I soon returned to the School business at Athens, leaving Mr. Fossum in charge. Nearly a fortnight elapsed before I was able to return to Eretria, and it was then that our hardships really reached their extreme point.

On this occasion I was joined by my colleague at the School, Professor Richardson of

THE SITE OF THE TOMB OF ARISTOTLE BEFORE EXCAVATION.

Dartmouth College, and by Mr. Brownson of Yale University, one of the students of the School. We sailed out of the Peiræus on the evening of Wednesday, February 18. The weather had been somewhat stormy during the day, but seemed fairly settled when we set sail. Now the voyage from the Peiræus to Chalcis usually occupies from nine to ten hours. Although, during the night, we had every reason to be aware of the inclemency of the weather, upon awaking early in the morning we expected to be very near Chalcis. But we were much astonished to find the vessel rolling and pitching in a very violent manner, which we knew was quite impossible in the sheltered Euripus. It was by no means pleasant to be informed that we had not got further than Cape Sunium,—a few miles from the Peiræus,—and that, in fact, we were then engaged in an apparently futile effort to round that point. It was blowing a hurricane, and we were trying to sail right in the teeth of the wind. Our captain seemed somewhat uneasy, and for the present was confining his ambition to an attempt at reaching the harbor of Laurium, which is only a few miles by rail from Athens, there to await better weather, as it was impossible for the ship to cope with such a storm. With full steam on, and with much puffing and staggering of the vessel, which was fairly seaworthy, we succeeded, at ten o'clock in the morning, in reaching the harbor of Laurium. But even in this harbor we were not completely sheltered from the storm. It was impossible to send a boat ashore, or in fact to have any communication with the mainland, and we lay there tossing about, with some English and other coaling vessels close to us, in constant danger

of drifting into one another by the dragging of anchors. The whole of that day and night and the next day we remained in the harbor, and I really believe that we would have remained there for another day and night if our provisions had not given out, and we had not all joined in urging the captain to make a bold attempt at weathering the point, which would bring us into the Euripus. At one o'clock in the morning of the third day we steamed out of the harbor, and in six or seven hours suc-

had fulfilled his part of the contract, and had taken us to the river of Vasilico; that now he wished to be paid, and that we must clear out. This, after much wrangling and exciting talk on his part, ended in our meeting him with MacMahon's words, "*J'y suis et j'y reste*" ("Here I am and here I remain"). We refused to leave the carriage until he had provided the horses. The other alternative was that he should take us back to Chalcis and make proper arrangements the next day. He angrily gave in, but assured us that we should have to pay the same large sum for each journey. We told him that this would be decided by the magistrate of Chalcis, and so we all drove back in the rain and at once proceeded to the police station. With some difficulty the judge, who was smoking his narghile in the adjoining café, was found, and, coming into the dingy court-room, proceeded to make and to offer us some coffee. We then sent for the irate coachman, who appeared on the scene, and seated about a small brazier, with several lounging and interfering Greeks standing about us, the legal proceedings began. We mustered up our best Greek, throwing in here and there a touch of Demosthenes and Æschines, which, I fear, was lost upon the unclassical Greeks; and, after allowing the coachman to lay his charge before the court with much gesture and vehemence, we opened our case, turning the defense into an accusation. We claimed that, owing to the breach of contract in not providing, as had been promised, means for the continuance of our journey at Vasilico, we had lost our day, and had suffered much discomfort; had to defray the expenses of a night's lodging at Chalcis, and had caused our friends at Eretria considerable anxiety. We were therefore justified in claiming heavy damages from the false coachman, who had dealt with us not as a Greek but as a Turkish brigand. But, considering his youth, and recollecting the friendly relations which subsisted between the American republic and the kingdom of Greece, and swayed by the affection which we felt for the whole Greek people, especially the inhabitants of Eubœa, we should not press our suit, and should only demand that on the next day we be put in a position to continue our journey. We were prepared not only to waive our claim that any money should be paid to us, but we might even give the handsome remuneration which we had promised to allow for one journey as covering the two. When we had finished, the judge gave a long pull at his pipe, blew the smoke through his nostrils, and declared that there was much justice in what we had said, but that he knew the lad (who was over thirty years of age) well; that he knew his father and mother, and that he was a good lad; that we

GOLD EAR-RINGS.

ceeded in reaching the Euripus, landing at Chalcis in the rain and wind at about eleven o'clock in the forenoon.

With a number of boys and men carrying our baggage, we walked through the rain and mud to a small cook-shop, where we proceeded to take what we then considered a very sumptuous meal. We were eager to push on, and at once began to seek for horses in order to continue our journey to Eretria, but we were informed that the roads were thick with mud, and that the stream at Vasilico, half-way between Chalcis and Eretria, was so swollen by the rain and snow that to ford it would be impossible—in short, we met with flat refusals wherever we asked for horse, mule, or donkey. At last the owner of a carriage told us that he would take us as far as the river of Vasilico, and assured us that there he would find for us horses or a cart which could carry us across, and thence to Eretria.

Having made our bargain, and acceded to his unusually high demand, we started on our drive about two o'clock in the afternoon. All went well until, after an hour and a half, the coachman pulled up in the middle of a muddy field, and blandly informed us that we had arrived at our destination. I had noticed that as we were nearing this point he had asked a rapid question of a stray shepherd, or of a peasant lounging in front of his hut, and when I asked him where the horses were which would take us across the river, and where the river was, he told us that the river was some five hundred yards further on, and that we must see whether we could get horses or not; that he

were good and distinguished foreigners; and that he felt sure we would not deal hardly by the poor man. We answered that we had felt sure, from the first moment of gazing into the countenance of the youth, that he was a good man, but that his goodness had for once forsaken him; that as he was young there was time for him to make amends for his faults; that we should not press him hard; and that, if he would fulfil his contract on the next day, we would, if satisfied with him, give him a handsome present in addition to the pay we had agreed upon for the first journey. By this time the whole party were in good humor, the coachman himself humbly begged our pardon for his too emphatic insistence upon what he had erroneously conceived to

mails for Eretria had not been forwarded for more than a week, and so we insisted upon carrying the mails with us, among which we afterward found several letters written by us more than a week before, and which our friends were anxiously awaiting. The judge, joined by the chief officers of the city, came to our aid, and that evening insisted upon showing us great attention in the chief café.

The next morning our coachman arrived in good time and good spirits, and, having loaded the mails, our packages, instruments, and a large demijohn of good Chalcis wine upon our vehicle, we again drove through the fertile Lelanthian plain to the scene of the wrangle on the previous day. We walked to the bank

be his rights, and they all wanted to take us to the nearest café and to stand us drinks. This we refused, and, having sent a telegram to the demarch of Eretria to meet us next noon by the river near Vasilico, we arranged to make an early start the next morning. At the post-office we ascertained that the

of the river (where the two large piers of a very fine bridge which had been waiting for two years for the iron girders that are to span the river, and to make the new road between Chalcis, Eretria, and Batheia practicable, were still gaping in imposing solidity, but affording no help to us), and shouted and

THE FAMILY INCLOSURE CONTAINING THE TOMB OF ARISTOTLE.

shouted for half an hour for the man with horses or carts whom we expected to be there from Eretria, but with no success. Our coachman then hunted about for horses on the near bank, and assured us that he would procure them; but after wasting another half-hour he succeeded in finding only one little white horse that looked like an over-grown dog, and we were left with Hobson's choice. The sturdy lad who owned the horse said he could take us and our luggage over one by one on this poor beast. Each one of the party taking as much as he could carry, we packed the remainder of our baggage on the horse, and proceeded along the slippery and muddy fields to that part of the river-bank where there was a chance of fording. But even in this short distance we were not free from accident. Every member of the party slipped and fell with his load, and at last the poor little white horse rolled over on its side (fortunately not upon the demijohn), and stuck fast in the mud. Unloading what he had on him, the lad caught him by the tail, and two of us got him by the head, and we literally lifted the poor beast out of the mud. But it was out of the question that, with the rapid stream, we could trust either ourselves or our baggage to the precarious legs of the poor animal; and we at last had to accept the proposal of our sturdy guide that he should take each one of us in turn on his shoulders and carry us across the stream. And this he did successfully, bold Christopher that he was.

Proceeding up to the village, we there found, staying with the doctor, the coachman of the demarch of Eretria, who had insisted upon sending his own horse and coachman and a European-looking wagonette to meet us. We left our luggage to be brought by a cart, and as the day was drawing to an end, and was growing more and more chilly, we all huddled together in the wagonette and drove along the muddy road to Eretria, which we reached in two hours. Mr. Fossum and the anti-mayor had walked some way out of the town to meet us, and in the town itself the mayor and nearly all the inhabitants came to give us a hearty greeting. Immediately upon returning from my first visit to Eretria, I had sent to Mr. Fossum our trusty cook and master of all trades, Nikolaki, who had accompanied us on two of our previous campaigns. He was a carpenter by trade, but was, as most Greeks are, an excellent cook, and in every way a man of many resources. He had brought with him wood and tools, a store of provisions, camp-beds, and all the necessaries we could think of; had taken in hand one of the deserted houses; had cleaned it thoroughly, repairing the fireplace, so that wood could be burned therein, though it smoked vigorously; had constructed a long table and benches with the boards he had brought, and now stood grinning at the door of the hut, telling us he had prepared a *vasilico geuma*, a royal feast. We at once invited the mayor and his opponent, who stood scowling at each

other, and the Greek government inspector, who was there to watch our excavations in the interest of the Government; and, packed like herrings, we proceeded to a very jovial meal. It was the 22d of February, and we at once informed our guests that it was Washington's Birthday. We made a series of after-dinner speeches, in which we enumerated the causes we had for being justly proud, ending by recalling the motto of our republic, which we had lived up to in being the only people who could ever boast of having united at their board those distinguished and noble gentlemen—the mayor and the anti-mayor.

It looked as if fortune were really smiling upon us, for the rain and snow which for some days had prevented Mr. Fossum from continuing his work at the theater gave way to bright sunshine on the next morning, and we at once continued our work there with an increased staff of workmen.

On my previous visit I had decided upon beginning excavations on a site about half an hour's walk from the walls of Eretria toward Batheia, because of a fragment of beautifully worked marble molding which I had seen there, and of the traces of a marble wall immediately below the surface. It looked as if somebody else had made a tentative excavation on this spot some years before, as in the whole neighborhood, which is filled with ancient graves, the inhabitants for a long time past have been carrying on their secret digging, and value very highly the sites likely to contain ancient graves. I was informed by our friend the prospective mayor that this property belonged to his kinsman the late mayor, and another part to one of his brothers, who lived at Corfu. The part possessor had promised to communicate at once with his brother, and to obtain for me permission to dig on his ground. But I now found to my disappointment that the distant brother had not yet communicated his assent. While discussing the possibility of beginning excavations at this spot, I was informed that one half of the ground upon which I meant to excavate really belonged to one of the workmen engaged at our excavation at the theater, who willingly undertook to accompany us thither, and to

join the party of workmen to be employed there. I also persuaded the previous mayor to take the responsibility upon himself as regarded his brother, since he and his brother would be the gainers, inasmuch as by law the Government would have to compensate him to half the value of the objects which we found, and which would be housed in their museums. At the theater we had thirty-two men at work, with wheelbarrows, baskets, and two carts. Our friend the would-be mayor also urged me to begin work on some of his property, where he had every reason to believe there were a number of ancient graves. I readily came to a private agreement with him, and decided also to dig on this spot. It was here that we discovered, besides numerous objects of smaller interest and value, the beautiful gold ear-rings in the shape of doves, which are, to my knowledge, the finest specimens of ancient jewelry, and also beautiful specimens of the slender white vases, with graceful figures in outline and color, commonly known as Attic *lekythoi*.

On Tuesday, February 24, accompanied by Professor Richardson, I began excavating at the site with the marble molding. We followed up and laid bare a beautifully worked marble wall built of the best Greek masonry, with evenly worked blocks, each about a me-

DRAWN BY W. TABER.

THE EXCAVATION OF A TOMB.

ter and a half long, and below the exquisitely worked molding two further layers of marble blocks, all of the same dimensions, resting upon two layers of well-worked calcareous stone called *poros*. The whole formed a foundation for a structure which is no longer extant, the foundation being two and a half meters high. But this wall continued for thir-

THE TOMB OF ARISTOTLE AT THE ANGLE, TOGETHER WITH THE TOMB OF BIOTE, BOTH WITHIN THE FAMILY INCLOSURE.

teen meters only, and then returned at right angles at each end, the sides being only a meter and a half in length. On the inner side this marble structure was backed by large blocks of poros, and in the inner angles we came upon, and had with much labor to break up and remove, two layers of such blocks superimposed at right angles one upon the other. We were much puzzled as to what this building could have been. Temple or house it certainly was not. It might have been a portico facing the sacred road which ran along its front; but this was unlikely. After two days' work our skilled grave-digger assured us that it could not be a grave, and, discouraged by evening, and having many other sites that were waiting our examination, we followed the advice of the experts, and stopped work. But in the night I was kept awake by the thought of what this curious structure might have been; and remembering the aphorisms already quoted, again set to work there the next morning, digging in the interior and breaking up the huge blocks of *poros* which impeded our progress downward.

Here began a new difficulty. At one moment it did appear as if it was a grave, and then our workman who owned this half of the site refused to allow us to dig any further. There was much wrangling and shout-

ing. He then informed us that it did not belong to him, but to his wife, and that his wife had not given her consent. This information served to alter the tone of the dispute, and I attempted to turn the whole into a jest. But he only grew more obstinate. The comic element reached its height when, pick in hand, he sat down upon one of the blocks, which we then hoped might be the cover of a tomb, and said that it was his grave, and that nobody should open it. It was now time for us to show indignation; and I informed him that by taking part in the work there, and receiving our pay, he had given his consent beyond all doubt, and dig there we would; and I requested him to go back to the town and to bring his wife, saying that I would arrange the matter with her. Amid the jeers of the workmen he left in great wrath, and we at once proceeded with all haste to remove the block, to find—another one. And when the mutinous workman returned, looking rather sheepish, and saw that we had not come upon a grave, he was very anxious to continue his work; but he was dismissed, at least for that day. In the evening we had reached the fourth layer of these blocks, which

appeared to be the last, and then our expert grave-digger drove his crowbar down into the earth, and, upon examining what adhered to the point, pronounced it virgin soil. And so we again decided to give it up. It now appears to me not impossible that the workmen were in sympathy with the owner of the land, if not conspiring with him, and I certainly believe that they would have continued the excavations after we had left, during the night.

Again I was kept awake puzzling over this curious structure, and by morning I had decided to lay bare and to see with my own eyes how the virgin soil within this wall looked, and to clear the place, if it took a fortnight of futile labor. On this Saturday the weather looked threatening. It was very cold and dark. The faithful and skilled Morakis, a hardy Spartan, now had charge of the workmen, and it was he who throughout sided with me in maintaining that it was a grave. I increased the staff, and we began to dig with energy at the southwest end of the inclosure. At three o'clock in the afternoon we came upon some blocks of poros which lay at a different angle to those which we had removed above them, and soon we saw clear before us a rectangular space formed of three huge blocks, the customary shape of one of those stone coffins which are let deep down into the ground. There were two huge blocks

seven feet long joined together at each end by smaller ones three feet long, and covered with two or three well-cut stones. It had now begun to snow, and the sky looked black. I shall never forget the moment when the men raised the huge covering slabs, and from the stone coffin there gleamed through the earth, which had fallen in, the shimmer of gold, while the tops of vases just peeped out at head and foot.

The excitement was intense. Morakis danced and shouted; and in less than an hour the mayor and the anti-mayor, and a large number of both parties, with coats and cloaks and umbrellas, came tramping out to where we were digging. They were very much in our way, and it was hard for us to move about. But great was the excitement when, carefully working on with knife and finger, one gold leaf after another was extracted, to about 150 in number, which filled a large square handkerchief—leaves of all shapes, and of pure solid gold. And when at last the signet-ring of the ancient noble Greek who was here interred, upon which was a rampant lion with a star above his head and at his feet a thunderbolt, was pulled out of the earth, where there were some bones of the fingers, there was a shout of wonder, and each wanted to see and handle what was at once put in security by the officer in charge. In spite of the snow and the cold wind, which grew thicker and intenser that night, we had a merry supper; for at the theater and the other graves it had also been a lucky day, with many interesting finds.

Though in the interior of Greece, in the mountains of Bœotia and Thessaly, there are severe winters and much snow, I have never on the sea-coast and at Athens seen snow lie for more than a few hours, and I therefore confidently hoped that by the next day, Sunday, the weather would improve. It was not only for the digging that we looked forward to such a change, but because of the extreme discomfort we endured in our houses. It was impossible to go out, as the roads were full of slush, with large pools and clinging mud, and we were huddled together, four in one small room and two in another (Mr. Pickard of Dartmouth College, and Mr. Gilbert of Brown University, both members of the School, had also joined our party, and were busily engaged in surveying the district). With a smoking fire which gave no warmth, with no glass in our windows to keep out the cold winds and the damp, with walls clammy

with moisture, seated on our camp-beds, capes and ulsters and shawls could not make us feel really warm. So we sat the entire Sunday, each endeavoring to deceive the others and himself into good spirits. But it continued to snow all day, and it snowed and rained all night. This was unheard of in Greece, and we felt confident that in the morning the southern sun would soon melt away the snow and allow us to begin work anew. It will easily be understood how eager we were to continue our work at the tombs; for it was now evident that the marble inclosure was one of the many family graves, and that there must be several other stone coffins within it; and being the finest structure of the kind within the whole neighborhood of Eretria, and within the experience of any of our grave-diggers, we felt convinced that it must be the grave of some distinguished family, which might tell us a story of surpassing interest.

But Monday morning it continued to snow, and by the afternoon there was a foot and a half of snow lying on the ground. By even-

DRAWN BY W. H. DRAKE.

TWO STYLLI, WITH PEN IN CENTER, FROM THE TOMB OF ARISTOTLE.

ing our impatience almost reached despair. But surely the next day would bring us sunshine, and we could at all events begin work in the afternoon. But the next morning again brought snow and rain. The rain, it is true, melted some of the snow, but the winds were cold, and there seemed no hope. My impatience gained the mastery over me. I called Professor Richardson, and begged him to tell the students that, as they were all full-grown men, it was for them to consider their health, for which I could take no responsibility; but that I could wait no longer, and was determined to dig with my own hands, and that whosoever would join of his own free will was welcome. Professor Richardson started at once to call the students, but at the door he turned back and, picking a line from Schiller's "Wallenstein" out of his wonderful memory, cried gaily:

Nacht muss es sein wenn Waldstein's Sterne leuchten.

(Night must it be when Waldstein's stars are shining.)

DRAWN BY W. H. DRAKE

TERRA-COTTA STATUETTE OF "PHILOSOPHER," FROM THE TOMB OF ARISTOTLE.

"Don't mock either the great Bohemian or me," I said; "this is serious." But the spirit was contagious. All the students came and enthusiastically offered to go out and dig. All our workmen refused to stir except three led by the faithful Morakis. Our cook prepared a famous breakfast, and, wrapped up in whatever clothing we had, with red blankets from the beds, the canvas bags in which the beds were packed, and with picks and shovels and baskets, we all trotted off through the village in the rain, singing American college songs. The shutters opened, and the people looked out at the crazy foreigners, for mad they certainly thought us. We waded through the mud, and reached the tomb; and now began some really hard work. The picks stuck in the wet earth, which was as heavy as lead, and each lift of the spade as we threw soil into the baskets was an athletic feat. And then we had to pass these baskets full of black, heavy, muddy earth from hand to hand, and to wrestle with

them before they gave up their muddy contents. But we toiled on until we reached another tomb immediately beside the one which had contained all the gold. Morakis, when he gave himself a moment's rest, would burst out in wonderment, and would exhort the other workmen to take note how these gentlemen could work. It was really comical, with the curious clothes they had on, to see the form of the learned Professor Richardson picking away vigorously; while another spectacled student filled the baskets which were handed from one to another. But the work, at all events, kept us warm. When, however, we got down five or six feet, to the narrow compass of the grave, we could not all be occupied at once, and then it was hard work to keep warm. Yet our greatest fear was the advancing night. When, toward dusk, we had succeeded in lifting up two of the covering stones, we found that there was at least two hours' work remaining before we could clear out the grave itself, and begin the delicate work of freeing the objects it might

contain from the surrounding soil without breaking. On the other hand, we could not possibly leave the grave open at that stage, as it was likely that others would do what we had left undone, and that we never should see the treasures which we hoped it might contain. And thus, chilled to the marrow, at about six o'clock, as there was no more work for them to do, most of our party returned to Eretria, leaving three men to finish the work by lantern-light.

Crouching within the hole, we watched with bated breath while Morakis was cautiously peeling away the earth from the inside of the stone coffin. One of the blocks of the covering stones had been broken, and when, after a few small fragments of gold had led us to expect a find similar to the one we had made in the first grave, no object of value or interest was forthcoming, the doubt crossed our mind whether this tomb had not been rifled in antiquity. The crime of robbing a grave was, in

the days of ancient Greece, severely punished. After nearly three hours' work, the grave was thoroughly examined and found to contain naught of interest.

But the next day was indeed a bright day, and one which was to compensate us in every respect for our previous hardships.

I remembered that in these family inclosures the principal graves are not in the center, but at the angles. Accordingly this morning we began to dig at the other angle, and at the end of the day we had come upon another sarcophagus.

This grave was evidently the earliest and most important one, and the one for which the inclosure had been built; for a portion of it was immediately under the wall of the inclosure itself, and accordingly in the person here buried we should expect to find the man for whom all this structure had been built. Soon again there was the glimmer of gold; and carefully clearing away the earth, I began to pull at the portion that became visible, which at once appeared to me thicker and more solid than a leaf, expecting, however, to find a leaf similar to the one that filled the grave we first found. But the leaf would not give, and so I had to cut away the earth further in, and still further, until at last I was able to extract a broad diadem, or fillet, of pure gold, such as was worn round the brow. We now pushed on with renewed eagerness and caution, and there came another broader band of gold with repoussé pattern, and then still another, and another, until we found six; and finally, reaching the point where the head lay, and where a small fragment of the skull was still preserved, there came another, a seventh band of gold, with leaves like a wreath attached to it, which crowned the person here interred. There were several smaller vases and bronzes, and a knife; and then came two styli. Now, with these two complete styli and fragments of a third, we also found a metal pen shaped very much like our own, the only specimen hitherto found in Greece proper, though there have been found boxes which contained these pens, and inkstands. It was now evident that the person here interred, for whom the inclosure was made, was not only a man of great distinction, but a man of letters.

We had found several interesting terra-cotta figures of mythological or ideal character in this grave, but at the head we finally discovered a terra-cotta, distinctly a portrait, of the style of portrait-statue well known from the fourth century B. C., of a man draped in his cloak, with both hands folded at the side. Now, this attitude corresponds to the description we have by a certain Christodoros of the statue of Aristotle which he saw at Constantinople. On

the next day we disclosed the grave next to this one toward the interior, built at a different angle, and, from the various stones that were used in its structure, distinctly of a later date. At the foot of this grave, carefully placed on the center of a large slab which had before served some architectural purpose, was a smaller marble slab upon which in clear-cut letters was the inscription [B]IOTH [A]ΡΙΣΤΟΤΕΛΟΥ (Biote Aristotelou), namely, Biote, the daughter of Aristotle. The only male name which we found connected with the tombs, and referring to the family which had made this inclosure its last resting-place, was the name of Aristotle.

The facts will speak for themselves. In 323 B. C., Aristotle, a man of considerable wealth, the tutor and friend of Alexander the Great, was compelled to fly from Athens and to take refuge at Chalcis, where he certainly had property, and whence either the family of his father or mother sprang. In the following year he died at Chalcis, not, as some biographical account has it, by drowning in the Euripus, or by his own hand, but of a complaint of the stomach. Nor can we give credence to the late and untrustworthy tradition which tells us that his remains were subsequently taken to his native town of Stagira. From the nature of his will it is evident that at this time his chief property and home were at Chalcis and not at Stagira. Here at Eretria, which we know to have been a seat of philosophy, the fields of which join those of Chalcis, and which, as we have evidence to show, was a special place for burial, we find this tomb, undoubtedly that of a distinguished family; we find the chief grave within this family inclosure to contain the remains of a very distinguished man, as is evident from the gold crowns laid there, probably by his friends and admirers, at his funeral; we find this distinguished man to be a man of letters, as is evident from the styli and the pen; and we find within the family inclosure the name of Aristotle. For the present I will not lay too much stress upon the correspondence between the terra-cotta statuette and the description of the statue of Aristotle, nor will I dwell at length upon all the evidence which has since come to me. They confirm still further the attribution made so probable by the discoverers themselves. The treatment of this subject requires the critical sifting of so many passages and special points of archæology and scholarship, that I must leave this to be dealt with in the official report of the School of Athens. But I must say now that some of the doubts I have on a previous occasion expressed have become weakened. These chief doubts were based upon the fact that Chalcis, where Aristotle died, and Eretria, where this

grave is situated, were two distinct places. I have since found good classical authorities which tell us that Chalcis was at one time the name for the whole of Eubœa, and could thus be used for the district of Eretria. And from the will of Aristotle, handed down to us in Diogenes Laertius, from which I shall quote a passage, it becomes evident that Aristotle owned a large estate at Chalcis, which was not immediately in the city, but was in the country. This will is confirmed by Athenæus, and the portion which interests us runs thus:

May all be well [the will begins], but if anything happen, then Aristotle has made the following disposition of his affairs: That Antipater shall be general and universal executor. And until Nikanor marries my daughter, I appoint Aristomedes, Timarchos, Hipparchos, Dioteles, and Theophrastos, if the latter will consent and accept the charge, to be guardians of my children and of Herpyllis, and the trustees of all the property I leave behind me. And I desire them, when my daughter is old enough, to give her in marriage to Nikanor; but if anything should happen to the girl before she has any children, then I will that Nikanor should have the absolute disposal of my son, and of all other things, in the full confidence that he will arrange them in a manner worthy of me and of himself. Let him also be the guardian of my daughter and of my son Nikomachos, to act as he pleases with respect to them, as if he were their father or brother. But if anything should happen to Nikanor, which may God forbid, either before he receives my daughter in marriage or after he is married to her, or before he has any children by her, then any arrangements which he may make by will shall stand. But if Theophrastos should in this case choose to take my daughter in marriage, then he is to stand exactly in the same position as Nikanor. And if not, then I will that my trustees, conferring with Antipater concerning both the boy and the girl, shall arrange everything respecting them as they shall think fit; and that my trustees and Nikanor, remembering both me and Herpyllis, and how well she has behaved to me, shall take care that, if she be inclined to take a husband, one be found for her who shall not be unworthy of us, and that they give her, in addition to all that has already been given her, a talent of silver and three maid-servants, if she pleases to accept them, and the handmaiden whom she has now, and Pyrrhaïos [probably a slave]. And if she pleases to dwell at Chalcis, she shall have the guest-house which joins the garden; but if she likes to dwell at Stagira, then she shall have my father's house. And whichever of these houses she elects to take, I will that my executors do furnish it with all ne-

cessary furniture in such manner as shall seem to them and to Herpyllis sufficient.

Then follow legacies to other people and to slaves, injunctions as to what is to be done with statues which he dedicates, etc. And then he says:

And wherever they wish to make my grave, there, taking the bones of Pythias, let them also bury them.

And as regards the second doubt which I at one time felt, namely, that Aristotle was far from being a unique name, so that the inscription found in this tomb might refer to some other Aristotle, I can only say that it would have to be shown that such another Aristotle of a literary tendency was worthy of such signal honors as those conferred upon the person here interred, and that this Aristotle, unrelated to the great Aristotle, was connected with Eubœa. It seems to me more likely that the other names of Aristotle, which are to be found on an Eretrian inscription of the second century B. C., are connected with this family of the philosopher, which certainly had its estates in this district; and I would finally state that in this very inscription of Eretria I have found two names which directly correspond to the names of the family of the philosopher Aristotle. These names are Nikomachos and Prokles. For we know from Sextus Empiricus, supplemented and confirmed by other authors, that Nikomachos, the son of Aristotle, died without issue, and that his daughter Pythias married three times. First she married Nikanor, who is mentioned in the will, by whom she had no issue; her second marriage was with Prokles, who was descended from the Lacedæmonian king Demaratos, and by whom she had two sons, Prokles and Demaratos; and finally she married Metrodoros, a doctor, by whom she had one son, Aristotle, which later Aristotle is also mentioned in the will of Theophrastos. This younger Aristotle lived in the first half of the third century B. C. The date of the inscription, "Biote, the daughter of Aristotle," which we found, has been fixed as of the third century B. C., and thus Biote would be the daughter of Aristotle's grandson, who bore the same name as his grandfather.

We do not claim that the attribution of this grave to the great philosopher is proved beyond a doubt; but for the present we are justified in naming this grave, excavated at Eretria by the American School of Athens, the Tomb of Aristotle.

*Charles Waldstein.*

# THE CHATELAINE OF LA TRINITÉ.<sup>1</sup>

BY HENRY B. FULLER.

Author of "The Chevalier of Pensieri-Vani."

## III.

### LUCERNE: THE TRAIL OF THE SERPENT.

WHEN the Governor submitted to the Chatelaine the itinerary that was to regulate the earlier movements of their little instant appreciation of its ingenuities by telling him that it would never do in the world. For the good old gentleman, in his endeavors to evade the madding crowd, had avoided almost every center of interest. The Chatelaine admitted that Winterthur was, indeed, a dear little town, and that the Walensee, along with the Churfürsten, was just the spot for the poetical recluse; but their guest was not a poetical recluse, and would surely expect to see something of Interlaken, Zurich, and Lucerne, not one of which appeared on his plan. She assured the guilty Governor that Lucerne, in particular, was inevitable, and urged most reasonably upon her reluctant relative (who would have preferred purgatory outright to Lucerne in July) that it was better to dispose of this place at the start and have it done with—to check it off from the list before the full force of the season had begun to make itself felt. They had accordingly domiciled themselves with some friends up in the quiet suburban quarter behind the Hofkirche, and Aurelia West was thus enabled to indulge, without any delay to speak of, her insatiate appetite for music—the music of Lucerne.

*Facilis descensus;* and the Governor felt that to step from the Schweizerhof Quay to the deck of the steamer for Flüelen was but to pass from one circle of the Inferno to the next lower. This step they took on the morning of the day after their arrival at Lucerne; they were going through the worst at once, so as to have it over. But Aurelia West had, of course, not the slightest notion of the ordeal through which her kindly old host was passing, and her state, as she tripped along with the Chatelaine under the double row of chestnut-trees that shades the shore, was distinctly one of joy. Perfect weather, pleasant companionship, noble scenery—what more could mortal ask?

When their loitering along the quay had brought them to within thirty yards or less once noticed a group of half a dozen men trees close to the point of embarking. Some their elbows resting on its back, and others ease against convenient tree-distance others still, not of scene with a kind of oblique and matrons in passing and then looked in some group was a lady seated on pansive, all-compelling perher parasol to rap a set of back of the seat interfered Aurelia West recognized her progress through the Jura a part. The group of atten- two Englishmen, who wore knickerbockers and fore-and-afters, and who

the party, gazed on the curiosity, and several maids looked in that direction, too, other. The center of this the bench,—a radiant, ex-sonage,—and as she shifted her knuckles whose hold on the with her shoulder-blades, as the *grande dame* of whose she had inadvertently formed dant cavaliers included one

<sup>1</sup> Copyright, 1891, by Henry B. Fuller.

strove to appear very free and knowing; a Frenchman of the type that she had encountered on the train a fortnight ago; and a figure which, in spite of its novel and startling guise, she identified as the marquis who had been so serviceable at Delle. He now wore a flannel blouse and spiked shoes; on his back he carried a long coil of rope, and an ice-ax that threw off dazzlingly such sunbeams as struck their way down through the foliage overhead. His mien was very free, daring, noble, and careless, and many passers-by looked back on him with an awesome interest. Then another man, who had busied himself in fastening up the dangling end of the rope, turned his face around, and our friends recognized in him the passing guest who had honored Neuchâtel for a day or more, and had then flitted away with a carelessly civil hope that they might some time meet again.

Fin-de-Siècle smiled brilliantly, and took a step toward them; but the Duchess, who had seen Aurelia West before Aurelia had seen her, laid her hand upon his arm, and detained him for a moment with a whispered phrase or two. What she said did not dim his smile, and he advanced upon our little party with effusion. He was delighted to meet them, and so soon, too. The Duchess had just told him that she was already acquainted with Mees West—charming, indeed. And she would be more than delighted to meet Mees West's friends. Ah,—the Chatelaine of La Trinité,—the Duchesse des Guenilles,—the Marquis of Tempo-Rubato, whom Mees West had also met already,—Lord Arthur Such-a-one,—and so on, and so on.

The Duchess had straightened up her lounging Englishmen in a trice, and she met our two young ladies with her most careful manner. Her voice fell to a murmur. Her deportment became quiet almost to dejection. And when she looked up into the Governor's face with large, wistful eyes, and paid her dexterous little tribute to his worth and celebrity (she had never heard of him before, and knew but little of him except his name, even now), the flattered old gentleman had never felt more soothed or pleased. And when she turned on Aurelia West with a remorseful little smile, naïvely poking holes in the gravel, off and on, with the tip of her over-vivid parasol, and murmured that her dear mees must have found her sadly cold and unsympathetic the other day, but that really such a long, hard journey made her something quite other than herself, the Governor felt that so much refinement, sympathy, and courtesy must be properly met. He recalled certain ornate phrases from his youth, the use of which might form a suitable acknowledgment; but these old-fashioned gallantries fell curiously on the ears of the sophisticated

young men around him. They looked at one another slyly, and smiled; so the Governor's precise words I shall not give. You might smile, too.

The Duchess had no remarks to offer to the Chatelaine, and the Chatelaine had no replies to make to the Duchess. The Duchess did not once look into the Chatelaine's face, though she made one or two rather pitiful attempts to do so, knowing the eyes of her own circle to be upon her; but the Chatelaine regarded the Duchess, and all her friends as well, with a high and steady serenity, and without any sense of inconvenience. This, too, in face of the fact that she was apt to be more or less impressed by splendor, and was almost entirely at the mercy of any strong manifestation of modernity, a characteristic of which she herself had so slight a share. Indeed, it was the complete modernness of Aurelia West that had first interested the Chatelaine in this young Westerner, had afterward drawn her toward her, and, generally, had laid this poor young mountain maid under a burden of awesome deference from which she was only now emerging. But the Duchess, though fully as modern as Aurelia West, and much more splendid, did not embarrass the Chatelaine in the least; and this young girl from the Valais, as she quietly scanned the eyes that could not raise themselves to hers, was (more than anything else) congratulating herself that she could meet the great world—as personified in this brilliant figure—on its own ground, and yet not feel at any disadvantage.

Tempo-Rubato was the only one of the Duchess's followers who accompanied the Governor and his charges on board the steamer. He was committed, as it seemed, to some indefinite deed of daring-do at the far end of the lake, and he appeared disposed to appreciate, in the brief time that intervened before his impending struggle with Nature in her own stronghold, the amenities of civilized society. He seated himself aft beside the Chatelaine with the air of a connoisseur who had examined almost everything that civilized society had to offer, but who was now impartially open to any new impression that chanced his way. He would indulgently forego his absinthe for a little sip of spring-water; and Aurelia West, whose enjoyment of the Pilatus and the Bürgenstock and the rest the good Governor had made more complete by a glass of lemonade and a plate of biscuits, had her enjoyment increased by noticing that the Chatelaine's talk to Tempo-Rubato was in Italian, and that he was unmistakably flattered by it. She taxed her friend for having concealed this graceful accomplishment, but the Chatelaine did not seem to regard the command of conversational Italian

in any such light as that. As she was situated, she smilingly declared, hardly any tongue that she could employ was likely to come amiss, though English, despite her years at Neuchâtel (beloved of adolescent *Anglaises*), she had never mastered. The Val Trinité, she further explained, was the one valley in the High Alps where German, French, and Italian were alike spoken, and she was obliged to meet her trilingual peasants on their own ground. They enjoyed it, and so did she. Tempo-Rubato was himself enjoying her Italian, which had several endearing little peculiarities of expression, and which showed a vocabulary not altogether at one with that of Rome or Florence; but he was too tactful to compliment her other than by the one supreme compliment of carrying on the talk with the same taken-for-granted ease and freedom that he would have shown within his own native circle.

Tempo-Rubato's talk went discursively, flightily, yet dogmatically, over a rather widespread field, and developed a number of sinister and heterodox points that pricked the Chatelaine with a vague alarm. While at Neuchâtel, the note-taking Fin-de-Siècle had touched lightly on his friend's characteristics, and had once referred to the possibility of putting him, as the phrase went, into a book. It had struck the Chatelaine that the propriety of using a friend in that way might fairly be questioned—one should be allowed, she thought, undisputed possession of one's own personality; but she was hardly recent enough, as yet, to understand that notoriety was the most delicate compliment that one modern could pay another. She had listened, though, to Fin-de-Siècle's *précis*, and was therefore not wholly in the dark as concerned the make-up of the erratic personality now offered to her attention. His general attitude, it appeared, was that of opposition—opposition of the most refractory kind—to the old order as personified in the Duke of Largo, his father. This old gentleman was a most devoted son of the Church, more papal than the Pope; his son, accordingly, was a free-thinker of the most extreme type. The head of the house was the father of a family born under the prosaic circumstances of ordinary wedlock, as understood and practised among us Occidentals; the son, therefore, was all the more open to impressions communicated from a certain Persian friend of his, a sojourner in Paris, whose calm assumption that any man was entitled to as many wives as he could support and manage, carried with it an acute fascination. This new disciple had not yet put his theories into practice by undertaking the support and management of even one; but discrepancies between thought and deed are too common for this

particular one to be dwelt on at all lingeringly. Then, as Largo was an aristocrat of the stiffest and most exacting kind, so Tempo-Rubato's democratic propensities passed all bounds; and many of his friends had come to the conclusion that the only way to bring him to his senses on this point was to take him literally at his word, and to help to bring him into close quarters, unrestricted by forms and boundaries, with the people itself. But to this final test he had never yet submitted himself.

The Chatelaine listened to his daring discursions with considerable composure; they were quite remote from her own course of thought and action, seeming to belong to a world with which she had no special concern, nor was likely to have. She looked indifferently around over the crowd scattered about the deck, and gave an abstracted glance or two across the ruffled waters of the lake,—both the passengers and the waves giving the impression of changelessness in change proper to the Swiss season,—and her thoughts idly wandered back to the showy personage whom they had left behind on the Schweizerhof Quay. Who was she? how long had he known her? how had he probably become acquainted with her?—questions that she had no thought of asking, and which he would have hazarded some impropriety in answering, but questions that may be answered here properly enough.

He had first met her in Paris some four years previous; though she was not Parisian, as she loved to claim, nor even French, as she always would strenuously insist. She was of the Riviera, and, during a childhood which had stood considerable banging about, had strayed as far south as Naples, and even beyond. In course of time she turned up in Paris to try her fortune, and her fortune had begun, I am sorry to say, in no less reprehensible a place than the— but everybody knows its name. He had been principally indebted for this introduction to the painstaking but not infallible Fin-de-Siècle, who had dragged his new friend half-way across Paris only to strand him upon the empty inanity of a one-franc night. The big, garish place was almost deserted; a dozen young *flâneurs* roamed about disconsolately, and two or three notable "daughters of joy" had looked in, but had disdained to exert themselves for the applause of such an audience. But a few others—beginners, amateurs, lights of the sixth magnitude—were doing what they could to keep the ball rolling, and among them was this girl, whom Tempo-Rubato eyed from the first with an absorbing interest. She had good looks; she had a grace of her own, though she was new; she showed as yet only the first faint trace of the insolent audacity that was to come later; and so, when the orchestra passed from a vulgar,

jiggling, irritating air to one of a different sort,—one that was free, fresh, rapid, undulating, that spun and turned and doubled on itself with a splendid and complicated insistency that suggested the possibility of perpetual motion, after all,—the young Italian bounded forward, murmured a phrase in his own language and hers, and in a moment more both were committed to a step to which the floor of the Closerie was all unused.

Fin-de-Siècle was instantly in an agony of apprehension, and would have drawn the rash young fellow back at once; he claimed to hold his finger on the pulse of Paris, and more than once had he seen imported originality launch itself on that treacherous floor only to struggle back through the breakers of polite contempt or open jeers. But *Tempo-Rubato* was not to be stayed by his faint-hearted friend, nor did his nobility feel the need of deference to the opinion of such of his contemporaries as happened just then to surround him. And he justified himself completely. On another evening the same place, in full fête, might have repudiated him altogether; but on this particular occasion anything that served to fill in the unprofitable hours stood some chance of toleration, of acceptance, or even of applause. The novelty of the tarantella attracted attention from the first. Several youths, correctly dressed in frock-coats and high hats, had been looking on in contemptuous tolerance of a dance between a certain ill-assorted pair: a crass young fellow fresh from Anjou or Languedoc, who wore a cheap, ill-fitting salt-and-pepper suit, was throwing all the exaggerated enthusiasm of a novice into the series of senseless and disjointed flingings which he was directing toward his partner, a pale, thin, wearied young woman who wore a simple gown of brown silk, and who indulged at frequent intervals in a plainly audible sigh. There was nothing new in this, and the young men turned from the one dance to the other. A pair of merry little *étudiantes* who were rustling around with rich black silks on their backs, wicked little feather turbans on their heads, the ends of a skipping-rope in their hands, and evident intentions on a bulky and awkward Englishman in their faces, relinquished their middle-aged prey and crowded into the new circle too. Even a stolid *ouvrière* or so, such as occasionally appear at these places and dance with clumsy sure-footedness on the brink of evil, added their interest and applause to that of the others.

But to *Tempo-Rubato*, and to his partner as well, the onlooking circle was a matter of comparative indifference. When he had lightly thrown back the lapels of his coat he felt himself dressed out in ragged sheepskin, and the lustrous hat that he had snatched from his head

changed to a tambourine before his arm could even extend it. The hand that thrust back a straggling lock from the temples of his *vis-à-vis* had placed a striped and folded cloth above them, and the shake she had given to the disordered front of her gown had put a long apron there, wide-barred in barbaric stripes of color. As he danced around her with an indulgent and confident grace, the tired and callous musicians in shabby dress-coats became a band of blithesome, tangle-haired pipers; and when she in her turn circled about him with increasing confidence in every step, and a more open gratitude, the anemones of Pæstum burst into bloom all over the wide reach of the waxen floor, the low, painted ceiling rose to the height and semblance of the blue sky itself, the battered columns of Ceres and of Neptune advanced in stately fashion through flimsy panelings and tawdry mirrors, and the free, pure, blessed air of heaven seemed to blow abundantly and refreshingly through the tarnished atmosphere of the place. And when they had ended their performance he had given her a vogue.

That she could dance divinely was now patent, and presently it came to be discovered that she had a voice with five or six good notes in it. It was not a voice of any great strength or compass, but her articulation was particularly distinct; and she soon passed on to the "*Ambassadeurs*," where, in the rendition of couplets of a certain sort, a good articulation is of more importance than fine vocalization. Six months more found her at the "*Nouveautés*," where she began in minor parts, and where, in the course of a year, she came to create a title rôle (that of the *Duchesse des Guenilles*) in an operetta which a great master—great as regarded that *genre*—had composed expressly for her. Then for two or three years more she had enjoyed an immense vogue, and now she was taking a little outing—half work, half play—*en province*. There were not wanting those to hint that the rising of a new star had dimmed her luster, and that she was clever enough to see when Paris could spare her. But such gossip was heard only in dark corners, and had no place in the general hubbub of adulation which accompanied her to the Gare de l'Est, and saw her off, in her own special train, to Switzerland.

All of these facts *Tempo-Rubato* was obviously barred from laying before the Chatelaine; besides, none of these things had any place in his thoughts to-day. He was merely refreshing himself with a draught of some simple, cooling beverage, and if he compared it with the spiced wines which had tickled his palate these past years, the comparison was largely unconscious. It was a fresh and primitive little drink, and went

well enough with the crispness of the waves, the blue freshness of the atmosphere, and the stainless coverings of the lofty peaks around them. He looked into the clear, unclouded face of the Chatelaine, and smiled drolly as he realized that the rôle descending upon him required for its complete and sympathetic interpretation a horn, a huddle of sheep, an echoing rock, and a gaping traveler with a centime in his pocket. There was no Paris, no Rome; all the world was only one amphibious Arcady.

They separated at Flüelen. Tempo-Rubato moved onward toward the Bristenstock, while the Governor and the Chatelaine devoted a few hours at Altdorf to quieting Miss West's uneasy doubts about the historic actuality of William Tell. And in the evening, after their return, they accompanied her to the Kursaal, whither she was impelled by a strong but unacknowledged desire to test the actuality of Mlle. Pasdenom, whom she half suspected of having drawn Count Fin-de-Siècle from Paris, and who was on the eve of her first appearance in Lucerne. Before they reached the theater an instrumental clamor advised them that the overture was well under way, and they had barely taken their seats when the curtain rose, and the Chatelaine's first operatic performance was initiated with the spectacle of a dozen young — girls? — yes, girls, ranged across the stage in the dress and posture of scullions, who began to sing and to beat time on pots and pans. The Governor was much taken with this auspicious opening; he had not seen an opera bouffe for twenty years, and he settled himself down to a study of the modern guise which this form of amusement has assumed. But Aurelia West saw no great novelty here, and before the first chorus was concluded she had taken time to make a hurried survey of the program. The name was easy enough to find. There it was in big, black letters — “Mlle. Eugénie Pasdenom.” And Mlle. Eugénie Pasdenom would make her first appearance in Lucerne in the great part which she had created in Paris and had played there over a hundred and fifty times — the part of — No, no, no, no! Impossible, incredible, outrageous! It could not be! But it could be, it was — the part of the *Duchesse des Guenilles*.

She caught her breath again. She felt her cheeks; they were on fire. She glanced stealthily right and left at her companions, but they were both trying to catch the opening bit of dialogue that gave the clue to the situation. The situation, indeed! What was that situation compared with her own? The awfulness of this forced itself upon her instantly, overwhelmingly; and she saw in a flash what a blind, foolish, silly child she had been. Had she not read in the “*Figaro*” the day before her own departure that the Pasdenom was on the point of leaving for Switzerland by special train? And her uncle's nervous haste had bundled her on board of that train. Why had that odious man offered her that glass of kirschwasser at Chaumont? Because he had taken her for one of the troupe — some new member, perhaps, added to meet an emergency. Why had they been so uncivil to her in the Pasdenom's compartment? Because she had been so rude to him in the other one. And if some of them were actors, why not all of them? And if the “*Duchesse des Guenilles*” was but a name borrowed from the theater, who was that bold man on the steamer who called himself the “*Marquis de Tempo-Rubato*?” What marquises were there on the stage? There was the one in “*Linda*,” but he was old. Was there another — younger — in “*Madame Angot*?” But that was no matter; the impudent fellow had presumed to bandy words with her Chatelaine. He had told her that he had a little *albergo* on the Lake of Como, where he should be in September, and that if they came to find themselves driven that way by stress of weather, they would find,

as the old formula ran, good beds, good wine, good attendance. And they had thought he meant a villa or a palace. A palace—yes; one like Claude Melnotte's—an empty nothing of stage scenery. And all his picturesque posing had been merely a full-dress rehearsal in open air, and all his compliments but the insolent persiflage of a player off on a day or two of leave. Ah! but that woman—that woman! She was likely to appear at any moment; she might be standing in the wings now waiting for her cue. Would she have the first entrance or the second? Might it not, oh, might it not be even as late as the third? Or could not some crowning mercy hold her off until almost the finale itself? How could she explain to the Chatelaine? What would the Governor think?

But Mlle. Pasdenom came on just as the exigencies of the piece required, and with absolute disregard of the feelings of the suffering Aurelia. There was a burst of harmony, a little more blatant than usual, from the trombones and the fiddles and the rest, and Aurelia, knowing full well what it meant, shut her eyes tight—tight. And when she opened them the star had stepped out with an airy boldness, and had taken possession of the stage and the house. Of her identity there could be no possible doubt; the distance was so short, the glare of the footlights so searching, that no costuming, however clever, could have concealed it. The one look that Miss West gave was enough, and for the rest of the time she sat with her eyes on the program, listening now and then to mademoiselle's feint at singing, and judging from her searching accents that a good deal of broad, extravagant acting was going on. She knew that the Chatelaine and her guardian had made the same discovery, and she felt the movements with which both had turned toward her looks of inquiry that her own eyes had been unable to meet. Her heart was beating, her head was bursting, her eyes were on the point of overflowing, and when the curtain had descended on the hurly-burly of the first finale she asked to go. The Governor had more than satisfied his curiosity, the Chatelaine had not been much impressed by the merits of the performance nor by the tone of the place, and they all left at once.

On the following afternoon the Governor was seated idly on one of the benches in front of the Lion Monument. The place was chill and dusky, and a tiny stream of water dribbled dolefully down the scarred face of the rock. Presently a soft step came along the path behind him, and a little black hand lightly touched his elbow. With the black gloves went a black gown, a black wrap, a black sunshade, and a large jet cross—the full penitentials,

as one might say, of opera bouffe. There was a large resignation in the eyes, and a touching little tremor in the voice. The Duchess had hoped that her new friends would be pleased to remain through the piece, since it was so difficult to do one's self complete justice in the first act of a first performance on a new stage; doubly difficult when the place was so small, the arrangements so familiar and impromptu, the audience so distracted by competing interests in the salons outside. If they had given her only a few moments' grace, it might have come to seem quite credible to them that ladies of some consideration should more than once have complimented her upon her art, and have even expressed a desire to follow in her footsteps. Ah, well, she had never before appeared in the provinces; never, assuredly, in a mere spot for summer-gathering; the piece was taken less seriously than in the capital; there was a certain relaxation, a certain informality, a perplexing cosmopolitan commingling—too many targets to hit with one poor little arrow.

She smiled wistfully in the good old Governor's face, and sat down on the other end of the bench.

But she was not complaining, he should understand, of her reception. No; that had been fair: not exactly what she had been accustomed to, but fair—fair. Still it was *triste* to be so far from home, to have none of one's associates about one, to miss the reassuring sound of a friendly hand at just the desired moment. It would take little, perhaps, to induce her to forego this Swiss tour even now; but, then, there was poor papa—

It was one of the Duchess's favorite fancies that a father, somewhere, was dependent upon her for support. The Governor knew that it was a very common thing to have a father, and he had no motive for refusing such an appendage here. He accordingly vouchsafed her a look of kindly sympathy, without considering too curiously the precise grounds for it. The Duchess, who always dressed her parts, no matter how she sang them, was now fluttering a little black-edged handkerchief in one pathetic hand. It was the grand opera that had always been her dream; but what would you?—she could accomplish merely what her gifts permitted. Properly, one was to be judged not entirely by what one actually did, but in part by what one would wish to do. Why must she find a bar rigidly set for artists in her *genre*, when no great difficulties were made for others who, while on a higher plane, were less—should she say it?—less capable than herself? Why must she sometimes hear herself spoken of slightly, disparagingly? Why, monsieur? Because she had allowed freedom and expansion for the growth and development

of her own nature — like a blossoming branch reaching out eagerly to the air and sunlight. She had tried to preserve the natural sweetness and buoyancy of her nature; she did not mean to transgress; she had never done anybody any harm.

The Governor gave a little gulp; he was sure of that — quite sure. But why should mademoiselle distress herself by such cruel self-questionings?

Suppose that, on the other hand, she had thwarted her natural bent and had dwarfed her growing nature through torturing attempts to conform herself to certain views which, after all, were merely conventional, or to hold herself to a certain standard erected by those who were in no wise inconvenienced by keeping up to it. She should then have soured her nature, embittered her spirit, made her friends sad, irritable, and miserable, and diminished the sum of joy in a world too joyless already. Who, indeed, threw a greater blight on life than those who were too good to allow others to be comfortable? Ah, monsieur, here was matter for grave consideration.

The Governor blinked two or three times at the Lion, and cleared his throat to make some rejoinder. But simple silence was all that he could oppose to such a union of beauty, talent, and logic.

Was it too much to hope that he would accept tickets for that evening's performance? They would then see her in a piece of a somewhat different character, — a more sedate character, — a higher character, one might perhaps be pleased to say. Her associates would then have been refreshed by another day in his delightful country, would be more at home in the house; his niece (as the Duchess guessed it) would then be enabled to form a more favorable opinion of the operatic art.

firm ground at last, and the Governor placed his foot upon it with-

out delay. It was impossible, dear mademoiselle; the young ladies and him-

self were to leave Lucerne in the morning, and they must devote the evening to friends in town. At another time — in Paris itself, perhaps —

The somber little figure rose to retire. She hoped that Mees West felt the misunderstandings of that journey to be fully cleared away, and she hoped that her best compliments might be presented to the charming Lady Bertha. Adieu, monsieur. She gave him her small, black-gloved hand, and then moved off with a head that drooped plaintively and eyes that studied the borders of the path. And the Governor, left alone, began to feel that there were situations where the margin between discretion and cruelty was very small.

And alone he remained for a quarter of an hour, wrapt in contemplation. He had been an admirer of the old school of acting — the robust, up-and-down school which left no doubt that it was acting; and the subtilities of the new school, in which the real and the simulated appeared to overlap, rather puzzled him. Had he witnessed an exhibition of nature or only a display of art? Had the woman been in earnest or in jest? But no answer came; least of all from his companion, who, perhaps, had retired asking the same question of herself.

But the Governor's statement of their future movements had been quite in line with the truth. Their lodgings looked down into the Kursaal grounds, almost, and Aurelia West had had her fill of music — the music of Lucerne.

Here was  
out delay.

IV.

CONSTANCE: SOME OF THE VICTIMS.

WHEN our friends found themselves prompted to leave the Lake of the Four Forest Cantons for a time, at least, the Governor again brought forward that part of his scheme which had contemplated an advance on Constance by way of St. Gall. There was no opposition to this project now, and it was carried out forthwith. The Governor had two or three friends and correspondents, scientific and educational, in St. Gall, and there would be plenty of interest in such directions to engage their attention. Then it assuredly would be an advantage to their young guest to see the country in its ordinary, industrial, every-day aspect, standing on its own legs, and tramping sturdily along without adventitious help; she should learn that Switzerland was not altogether dependent for support and progress on the golden crutches that *les Anglais* placed under her armpits. They would hasten to that obscure but deserving corner of the country where every third abbey was a manufactory, and where every other castle had been made over into a seminary. They would do justice to a town which was too full of school-houses, libraries, museums, hospitals—yea, even deaf-and-dumb asylums—to have any room for promenades and kursaals.

This reactionary program the Governor put through with a grim thoroughness that spared no detail, and as the train which carried them away from Lucerne tumbled rapidly down to the pleasant shores of the Lake of Constance, at the rate of a hundred feet to the mile, the two young women made no effort to conceal their satisfaction and relief; and when they found themselves set down at length under the monastic cloisters of the Insel-Hôtel at Constance, they found that their reformatory guardian had carried the new order so far as to have led them out of Switzerland altogether. For they were now in Baden.

They dined daily under the vaulted ceiling of the old Dominican refectory, and they strolled at twilight in the conventual thickets that ran down to the water's edge. They loitered away one or two forenoons in the cool quiet of the cathedral, visited the antique hall that witnessed the condemnation of Huss, and even made a pilgrimage to the spot where his martyrdom took place; and within a week Aurelia West had left all Gallic frivolity so far behind as even to make Mlle. Pasdenom's existence a matter of grateful doubt. In these various excursions, and others, they were attended by Baron von Habichtsgeb—no, it is too much—by Baron Zeitgeist, who was winging his way, with all his impedimenta, scientific and musical, from the Jura to the Tyrol, and who was more than pleased to find their paths thus crossing. For Zeitgeist was devotedly attached to the Governor, and he felt a very decided admiration, in his slow, non-committal way, for the Chatelaine; while he simply gloated over Aurelia West, whom he persisted in regarding, with no great reason, as he might have regarded some barbarian princess struggling upward to the heights—one whose efforts to divest herself of the last shreds of barbarism, and to smooth out the wrinkles and creases of the just-donned garments of civilization, offered him opportunity for the last refining touches in his study of ethnography. Aurelia bothered herself very little about ethnography, but she enjoyed Europe, and had taken to it aptly enough.

Zeitgeist had a way of preaching big sermons from very little texts; and texts for him

were always springing up everywhere, like wayside flowers. But the text that came to him in one of their morning walks through the embowered back streets of Constance was offered not by a single flower, but by a whole window-sill of them. This window-sill belonged to a humble little house, the doorway of which was festooned with vines, and was reached by a short path that passed between banks of homely flowers. Above the door the word "Druckerei" was painted on the stucco of the mouse-colored front; and when Aurelia West noticed that Zeitgeist had taken off his glasses, and was thoughtfully rubbing them, she was able to interpret the sign. She knew something was coming, and she drew the Chatelaine back into the shade to wait for it.

But it turned out to be only a very little affair, after all. The Baron, while in America, had had occasion to visit one or two printing-establishments, and was simply about to request mademoiselle to accept this tiny shop as typical of the Old World,—the world of small things, the world of quiet and contentment and domesticity,—as distinguished from the noise, and grime, and bustle, and shrieking publicity of her own America. Where, in all her broad country, could anything like this be found? Where could she show a family pursuing its vocation with such a quiet content and moderation, such a complete regard for its own idiosyncrasies, such a tender respect for its own tastes and preferences? Suppose they entered: they would find no dimmed light, no fouled air, no grime and clangor, no hectoring overseer, no tyrannical and wrong-headed "union," no superfluous wear, tear, and irritation, no suppression of the graces and amenities of ordinary life for the mere sake of a "businesslike" appearance; and yet he would venture that they would find the work of the place adequately done. *Après vous, mesdemoiselles.*

The place was in charge of a wholesome, rosy-cheeked boy of sixteen, who came forward with the pleased awkwardness proper to his age, and with whom the Chatelaine was presently talking in a free, off-hand way in his own native German. The shop had its proper outfit of type and forms and cases, and was as neat, orderly, and individualized as the foresight of Zeitgeist had anticipated. On a sort of little counter a few bits of work awaited sending out: a pile of carefully trimmed handbills betrayed the interest felt by a certain Bendel in *kalbsleber* and other commodities; and a hundred betrothal cards, deftly arranged in a little packet, foreshadowed, by the sample left on top, the coming bliss of one Wilhelm and one Margarethe. By the side of these a few small sheets of proof fluttered in the draft made by the open window, and the Chatelaine noticed, as she stopped to

put them in better order, that the text was in French. And did he speak French, then? she inquired of the youth at her elbow. Yes, gracious lady; but this was the work of his elder brother—he and his father were both away to-day. The manuscript had been left there yesterday by a French gentleman who was staying at the Konstanzer-Hof, and who had wanted to see how these few pages were going to look in print. Our friends glanced from the proofs to one another, and when they encountered Fin-de-Siècle that evening on the Seestrasse, it was without any great feeling of surprise.

He came toward them dressed in a noticeable traveling-suit, his eyes on the ground and his hat over his eyes. The *âme* of which he was making an *étude* appeared to be in sore straits. All at once he stubbed his toe, and though he now carried neither a nosegay nor a hand-bag, the departure from the Gare de l'Est passed once more before Aurelia's eyes, and she mentally registered a slip for which both the cup and the lip had now been found. She also privately confessed a little slip of her own: it was not she that he had followed to Switzerland. Nor was it the Pasdenom that he was now following through Switzerland. While surely, so far as the Chatelaine was concerned—

Fin-de-Siècle met the Governor, too, next day, and frankly avowed that his new theme was one full of interest; it was growing within him every day, and he had now come to the point where it was necessary for him to overflow in ink merely for his own relief. Nor was he backward in spinning a few more phrases as to the aims, materials, and method of his art. His plan, of which he seemed exceedingly proud, was simple enough—close observation, accurate transcription, nothing more. But the observation of his school, *monsieur*, was more than close; it was searching—yes, it was even remorseless; it spared nothing, since everything served its purpose equally. And when the master transferred the image from his mind's eye, and fixed it on those quires and reams of sensitized paper, with what cool dexterity, what calm, scientific precision, was the feat accomplished! No passion, *monsieur*, no preferences; above all, no fancy. The masters did not aim at romance for this generation; they were preparing historical data for the next. They were not devisers of trifling tales for an idle hour; they were erecting the pedestals due them as the leaders of a vast movement. Fiction was the great art of our day, as was music in the days of Mozart and Gluck, or painting in the days of Lippi and Ghirlandaio, or architecture in the great days of Chartres and Amiens.

The Governor had read a good many tales in his time, but he had never taken quite so top-lofty a view of the art of story-writing; and

he had an idea that the self-consciousness that busied itself with the rearing of its own pedestal was not altogether likely to be set upon it by a perverse posterity. And he said so rather tartly. In fact, the second advent of this young Parisian had not given the old gentleman any great pleasure. Nor had his first, for that matter; but then that had had the saving grace of novelty, at least. In truth, here on the quay at Constance, the Governor was not so certain of not appearing to disadvantage as he had been on the terrace of Neuchâtel, for Lucerne had intervened. Nor did he feel at all sure that Aurelia West's haphazard association with Mlle. Pasdenom had justified those headlong and promiscuous introductions on the pier — introductions that had enlarged the circle of their acquaintance by so many dubious additions. So he was accordingly disposed to be severe on something, even if that something was only a theory of fiction. It seemed to him — and he spoke with the slow laboriousness of one suddenly called upon to formulate the unconscious assumptions of a lifetime — that the great thing in art was not to know, nor even to feel, but to divine. Observation was good, assuredly; sympathy was better, even indispensable: but what, after all, was to be placed before the exercise of the constructive imagination freely working its own way on to its own end? — an imagination that seized on a word, a gesture, a flower, a flash of color, a simple succession of sounds, and by means of a few humble, external facts called out from within such a multiplicity of correlated fancies as resulted at last in a drama, a fresco, a symphony, a cathedral. The genesis of a work of art was the genesis of the echo; one word is spoken and twenty are evoked in reply — only no reverberations were to be looked for from empty nothingness. Or, if fiction must be scientific, let it look to the method of the naturalist, who from a single bone reconstructs and vivifies a complete animal. It was well enough to hold the mirror up to nature; but let it be a compound mirror — one that reflects, and re-reflects, and reflects again till the prosaic outlines of the original subject are increased, strengthened, multiplied, surrounded by the glamour of new presentations and new combinations, and the bare simplicity of the primary image loses its poor identity in the fused intimacies of a thousand secondaries.

Fin-de-Siècle listened with an indulgent pity to these antiquated sentiments, in which he detected the same old insistent note of a false romanticism which he was now quite tired of combating. He merely remarked that there was one respect, indeed, in which the coming fiction might well imitate the picture, the symphony, and all the rest. Now, one's apprehension of a picture was practically instantaneous;

one might get a very fair idea of a great church, outside and inside, within ten minutes; one might follow the whole course of a symphony in twenty or thirty; in the case even of a drama one might become familiar with it, outline and detail, in two or three hours. But with a book! — to become familiar with *that* required two or three days, or a week, or a fortnight, or a month, as the art of the writer and the interest of the reader determined. The idea of form suffered, the sense of proportion was dulled, the congruity and cohesiveness of the idea were impaired. No; he himself should never publish a book that might not be completely got around during one afternoon in a garden, or in a single evening over the fire.

The Governor had no objection to bring against this, having seldom read a book that seemed too short. But he had no more idea of following up Fin-de-Siècle's notion than Fin-de-Siècle had shown of following up his. So he merely asked the young man if his work could be carried on satisfactorily in the stir of a large hotel during the height of the season.

Fin-de-Siècle replied that, while he preferred taking his chances with a first-rate theme in a crowd rather than with a second-rate one in solitude, still he was obliged to acknowledge that his situation was not all that could be wished. The Governor came to his aid with a suggestion. A friend of his, a gentleman of means and of high scientific attainments, had a delightful place not more than ten miles outside of the town, where, during the season, he was accustomed to receive a limited number of *pensionnaires*. The house was a veritable château, and the large grounds were delightfully placed above the shores of the charming Untersee. The family was most agreeable, though rather numerous; yet an author of scientific fiction would know how to use the eccentricities and idiosyncrasies which a wide relationship was sure to embrace, while for a fortnight of quiet retirement no place in the world could be better. He would speak a word in that quarter if his young friend thought he cared to make the experiment. His young friend thought that perhaps he did; the Governor spoke the word; and when he learned that Fin-de-Siècle was actually domiciled at Thorheim he smiled a sly, derisive smile that it were not well to see. This young man was in search of humanity appearing at a disadvantage; well, his wish would be gratified.

But the distance between Constance and Fin-de-Siècle's retreat was only a matter of a few miles, a distance that could be covered by rail, or boat, or carriage, and the Governor saw more of this young master than he had hoped to. During one of his early calls at the Insel-Hôtel,

Aurelia West, who could now think of opera bouffe with something like equanimity, told him that she was sorry their stay in Lucerne had been too short to see his friend the marquis in any of his parts; she hoped for an opportunity to become better acquainted with his talents after her return to Paris. Fin-de-Siècle's reply to this was prefaced with a sudden, arch, surprised, insinuating smile, and he regarded her with such a marked increase of consideration as only one thing, she felt, could account for: he must be crediting her with some special, intimate, narrowly restricted information in connection with certain phases of *la vie de Paris*. Her guess was close, for he murmured with a great effect of secrecy that it was a thing really not to be alluded to. As a matter of fact, Tempo-Rubato had appeared a dozen times or so on the stage of the Folies Dramatiques; but, indeed, such things were scarcely to say themselves—it was all under the rose. Had she ever heard him sing? Oh, but he sang—a magnificent baritone. Had she ever seen him ride? He rode like a devil; he had learned in Amerique du Sud,—had she any friends there?—where the Duke owned a rancho. Oh, he could manage anything. Once in—how did they name it?—in Uruguay he had run away with a railroad train. And only last summer at Bellagio—Miss West had only to hold her tongue to have all her questions answered before they were asked; her mind was set at rest completely in regard to the title and estate of Tempo-Rubato; he was indeed a *marchese*, he indeed possessed the villa, and that opera bouffe characterization of him by his friend was altogether unjust; impossible that he should be an atheist, and a socialist, and a prospective polygamist!

Fin-de-Siècle was equally full in his details of the life at Thorheim. They were charming, well-disposed people; they appreciated him highly—so highly that they had almost opposed his leaving them for a single afternoon in Constance. Their appreciation was so oppressive that they had insisted upon providing a sort of footman to accompany him; they were killing him with kindness. They had a number of friends and acquaintances sojourning with them; several of these were exceptionally interesting people. One in particular, a gentleman from Stockholm, almost fascinated him. This guest had the freedom of a large apartment in a disused wing of the château, and had filled the place with models and reliefs of many well-known mountain-peaks and -chains, all his own work, and all done to scale with remarkable neatness and precision. Yet of the real mountains he had an inexplicable dread; nothing in all the world could induce him to set his foot on one. A singular type:

a cobbler going barefoot; a stroller jingling a pocketful of napoleons before a shop-window merely to pass on; a bachelor long and earnestly regarding the *beau sexe* only to remain a bachelor still. His Swedish friend, however, was in the habit of taking tramps and making excursions through this miniature Alpine world, and nothing pleased him more than to be accompanied by his visitors, whom he received and escorted with the greatest kindness and courtesy. Fin-de-Siècle himself had gotten up an appetite for breakfast that very morning by a twenty-mile walk through the Upper Engadine, and he felt that if the Governor and his party were to steam down the lake in that direction some afternoon, Herr Axenquist would consider their presence a positive honor.

The Governor pondered. He had no great desire to enter Fin-de-Siècle's new circle, but this offer brought up a point or two worth considering. The Chatelaine, of course, was equal to almost anything, but the amount of actual mountain-climbing to be expected from an old man in his sixties and a young woman fresh from the lapping luxury of Paris could not be great, and this facile substitute really came in quite opportunely. So one afternoon they took the train that skirts the bank of the narrow, river-like, hill-bordered Untersee, and in less than an hour they found themselves in the very heart of the Alpine world. They were hardly within the great gate which gave entrance to the park of Thorheim, when the Chatelaine found her attention forcibly taken possession of by a middle-aged lady who seemed to have been indulging in an aimless stroll through the grounds, and who was so glad to be able to fix her mind on some definite point that her greeting passed the utmost bound of cordiality. She was tall, angular, and faded; her hands played to and fro with a tremulous uncertainty; and the Chatelaine at once recognized her as the English spinster whose intrepid parrot had made the journey to Pontresina. When she learned that our friends had but lately passed through St. Gall, she turned on the Governor and asked eagerly after the whey-cure. Ought she to go to Gais or to Heiden? Had any of his friends ever tried Urnäsch? How did the accommodations compare? Did any of the hotels have their own goats? Was there an English church? Was it best to drink the whey hot or cold? The whey-cure was her plan through September, after which she was to pass on to Vevey or Montreux for the grape-cure—she had heard that the vines promised the greatest yield in years. Yes, she was moving around as actively as ever,—this with a sudden turn and smile in the direction of the Chatelaine,—she was quite the traveler of the family, in fact. Her people had been hoping that she would

remain quietly in one place; some of them had even come from England to see that she was properly accommodated here. Of course it was all very nice and pleasant here on the lake; was it not so, mongsieu' ? — this with a faded but arch little smile in the direction of Fin-de-Siècle, — the air was good, the scenery attractive, their host more than kind, but — well, her brothers hardly knew her, she fancied; she had little faith in the water-cure and less in the air-cure; she should be moving on presently.

They were all moving on, in fact, under the guidance of this amateur of cures, who was actively leading the way up to the house, thrusting hastily culled roses into the ladies' hands, and babbling to all alike in a voluble, barbarous French. Under the porte-cochère they met the proprietor of the place, a kindly, serene old gentleman, who seemed possessed of a patience and composure that nothing appeared likely to disturb, and by him they were presented to the guide who was to pilot them through their Alpine diversions.

The latter was a tall man of thirty-five, more slender than he should have been for his height, and more stooping than seemed proper to the mountaineer. His long hair was pushed back from his forehead, and fell sidewise in two great waves, one yellow, the other snow-white; and his eyes, which may once have shone with a splendid courage, now beamed but dully with the submissive patience of some cowed brute. He seemed a man out of whom all life and color and passion had been washed by the sudden and tremendous sweep of one great wave; but the Governor, who was already beginning to feel the first twinges of that shame and mortification which were soon to pass twenty times the utmost bounds of any annoyance that could possibly be felt by the victim of his ill-considered jest, did not learn their host's sad story till some time after. For the man before them had spent a night on the Schreckhorn in a blinding snow-storm. He had played his game with Nature on her own table and with her own counters, and had come away bankrupt. He presently led the way into his own quarters — his workshop, his studio, his gymnasium, his playground, as he said. It was a large, homely room, the walls of which were covered with maps, photographs, and sketches. In one corner stood a rough work-bench littered with broken bits of clay, half-emptied cans of gypsum, and a dozen fine paint-brushes soaking in a pail of turpentine, while various pieces of work in clay and plaster of Paris were ranged about on tables and shelves, — reliefs of single peaks, or of groups, or of whole mountain-chains, as the case might be, — some of them being small pieces on a large, while others were large pieces on a small, scale. To Zeitgeist, who had done some climb-

ing in the Tyrol during the previous summer, their host handed down a compact little model of the Ortler, by means of which the young man was able to recall at once the principal points of his excursion; while La Malade (as Fin-de-Siècle briefly termed the Englishwoman), who had followed the party quite as a matter of course, and who seemed perfectly at home in the rarefied atmosphere of the High Alps, suddenly launched herself on the Governor with a relief of the Sentis. The old gentleman, whose discomfort under the inquiring gaze of the Chatelaine was all the time increasing, gave his attention willingly enough to the fountainhead of the whey-cure. It was on these high pastures of the Hüttenalp and the Meglisalp — here, mongsieu', and here — that the goats were herded and the whey prepared. And this road, running through the ravine and crossing the brook, was the route used by the goatherds in carrying the whey down to Gais and those other places. Those patches of white on the top, now, were just snow-fields and glaciers; but if mongsieu' would see snow and ice —

La Malade abruptly set the Sentis down in the nearest available corner, and turned the Governor around toward a large relief that occupied the middle of the room. It was placed on a table some ten feet long, and represented that part of the vast Alp-chain lying between Monte Turlo and Mont Collon, forming the southern boundary of Switzerland. Before this monument of painstaking care and industry Herr Axenquist now stood with an air of grave courtesy, while the little pointer he held in his hand wavered over the sharp peak of the Matterhorn; and the Chatelaine, whose foot was now on her native heath, indeed, was greatly pleased, and took no trouble to conceal it. Here, *chérie Aurélie*, was the road down to Châtillon; and there ran the footpath across to Macugnaga; and over on that side, beyond the Col de St. Théodule, was the way down into the Nicolaithal; while here, of a verity, at the very head of this high and narrow valley, was La Trinité itself. Ah, *vraiment*, La Trinité! And the Chatelaine threw back her head and expanded her nostrils, as if she whiffed the mountain air indeed.

La Malade eagerly joggled the Governor's elbows. There, when had he ever seen anything more truly *magnifique*? What was more beautiful than those green meadows with that dear little rivulet running through them? Then could anything be more natural than the streaked and spotted brown that represented the rocks of this precipice, just here? And as for the fine dust that coated all the glaciers and snow-peaks, *that* had been her own suggestion. He should see the sun upon it. She rushed to the window and swept the curtain to one side. Ah, mong-

sieu', how it shone, how it glittered, how like the Alps indeed!

The host turned a smile of quiet appeal on the voluble enthusiasm of the Englishwoman. He hoped it would please his visitors to make some excursion or other under his care; he was a tried and trustworthy guide; he would undertake nothing too difficult for even the ladies, and he thought he could promise that none of them would be unduly fatigued. Here were the Tôdi, the Bernina; there was Cortina d'Ampezzo, in the Dolomites; or if they preferred they might merely cross the Splügen with him. The Governor, with a clear conscience, would have enjoyed this little flight of fancy beyond measure; as things now were, he said in a hard, determined voice, the occasion was exceptional, and so should the expedition be, too. He favored the best and the most: nothing would please him better than the ascent of Mont Blanc itself. Then he set his collar, and swallowed something.

At this suggestion La Malade gave a little cry of joy, and darted down under a table which had been concealed behind the open door. This, she declared, as her head bumped against the under side of the table, was her favorite expedition; she had been up fourteen times already, but it was every bit as interesting as ever. She whisked the cloth off the model, took hold of two corners of it, and Herr Axenquist laid hold of the other two, and thus the mountain was lifted into place. The host explained with a grave smile that the ascent was properly a matter of two days. It was best to get away from Chamouni at midday, and to spend the night in the inn at the Grands Mulets. The trip, however, might well stand a little compression; they should achieve the entire expedition in that one afternoon. And as the weather was fine and settled one guide might be made to do for the whole party, while anything like a porter could very well be dispensed with altogether. Here, then, was Chamouni; there was the road to the Glacier des Bossons; here, up through the valley of the Nant Blanc, was the path to the Pierre Pointue, on the edge of the Glacier des Bossons itself; higher up, the Pierre à l'Éschelle, with a view of the Dôme du Gôuté, and these various other eminences; here we cross the Glacier—and so on to the Grands Mulets. *Entrez! Herein!* Would they please be seated? such refreshment would now be set forth as the inn afforded.

Fin-de-Siècle whispered delightedly to the Governor that here was an original type in-

deed; the Governor winced. The Count smiled and nodded; the Governor groaned.

A maid came in bearing a tray, and the thoughtful mountaineer now regaled his guests with tea and cakes. He also offered fans, for, thanks to La Malade and her new arrangement of the curtains, the temperature, even at this altitude of ten thousand feet, was distinctly warm. This volatile person accepted a fan, but refused the tea, sending the maid back for her own approved beverage. And as she opened her bottle for herself, with the dexterity that comes from long practice, she vented a bit of good-natured sarcasm on the people who would make her believe that all chalybeate waters were alike, and that she might just as well decide to please herself with St. Moritz without sending all the way to Tarasp. But she had not been born yesterday, and if there was one thing she knew more about than another, that thing was mineral springs. Who

had attended to the placing and marking of all the springs and baths on these reliefs if not she herself?—putting them down in colors corresponding to their ingredients: the salt-springs at Aigle, white; the sulphur-springs of St. Gervais and Stachelberg, yellow; and so forth. To all of which her entertainer, now in conversation with the Governor, bowed an indulgent acknowledgment over his cup of tea.

The Governor was scanning him closely. To put this grave, composed gentleman under suspicion was unjust; to subject him to restraint was outrageous. If every one who indulged his fancy was mentally deranged, what might people be thinking of himself? If these reliefs around them carried good cause for medical surveillance, how then with regard to the antiquities at Avenches? Nonsense; this man was as clear-headed as anybody else.

Their host rose suddenly and ordered the tea-things out. They must lose no more time, he said. The glacier should be crossed before the sun had got too high. They must press on to the summit. Their real, serious work was just about to begin. He quickly threw open the door of a little cabinet, and passed out an alpenstock to Aurelia West. He thrust an ice-ax into Zeitgeist's hand, and pressed upon the Governor a long coil of rope, which the shame-faced old gentleman received as it had been a penitential scourge. And here were spectacles of colored glass; the glare on the snow was so terrible—terrible. Was all ready? *Allons; en avant!* With care, mademoiselle! with care!

He seized the Chatelaine by the arm. Beware that crevasse — it was just here that the young English lady had gone down and dragged her guide with her. Be cautious, young sir; this ice-steep was treacherous enough, in truth; but three steps — cut so — were all that was needed. There was no cause for alarm yet; slowly and steadily, and all was well. But what was this, rushing, leaping, tumbling, crashing down, with an ever louder roar? Back, back, monsieur! He pinned the Governor against the wall, and wiped the drops of sweat from his own forehead. Ah-h! it was happily past,—*l'avalanche*,—and none of them the worse for it. Well, then, here was the Grand Plateau, here the Mur de la Côte, here the Petits Mulets; but the summit, the summit, where was *that*? Was it in sight for none of them—not one—not one? He ran his hand excitedly through his long, disordered hair. Was it growing darker and colder? Was every one of them numbened? His eyes shone with a wild glitter, and wandered aimlessly about over the peaks and valleys beneath them. Ah; it was the fog, the cruel, treacherous fog; but hasten, hasten—here was the path, and the refuge was not far ahead. Up, up! No; you must not, shall not lie there. His voice rose to a shrill, strident tone, a tone full of the cutting sweep of the mountain-roaring wind, a tone stung by the tingle of gust-driven ice-particles spinning on and on in remorseless eddies. He suddenly flecked his hand across his face. He gave a short, sharp cry, and clutched *Zeitgeist* by the arm. Had *he* felt it too? And did he not know what it meant? They were lost—lost! They should perish there on the mountain, like others before them; for it was the snow—the snow—

The Englishwoman gave a shrill scream. The young men stared in amazement. Aurelia West and the Chatelaine drew back in terror. The Governor set his jaw, seized the unfortunate firmly by the arm, caught the pointer out of his hand, and in ten seconds had conducted the whole party down to Chamouni with a clear head and a sure foot. He placed their host on the chair beside the model, and gave him a glass of water. The poor fellow weakly kissed his hand, and burst into tears.

On the way home Aurelia West overheard the Governor invite *Fin-de-Siècle* to accompany them into the Tyrol. This was the form that the Governor's penance took. She did not catch the response, but she was willing enough that it should have been a no.

(To be continued.)

## VOICES FROM BEYOND.

I LAY upon the borderland 'twixt sleep  
 And drowsy thought dim as a wavering dream;  
 All consciousness a far, faint, starry beam,  
 Like glint of torch within a cavern deep.  
 About me voices rose with windy sweep,  
 Till all the pulses of the air did seem  
 Aflame, and bubbling in a liquid stream,  
 Pouring upon me in one gathered leap.  
 They raised in me a power uncontrolled —  
 These mystic voices, rushing madly by;  
 My feet were set where wheeling planets rolled,  
 My head upreared within the flaming sky.  
 A god I was within my human mold,  
 To trample death, and all his might defy.

THE PORT OF MASSOWAH, FROM THE MAINLAND.

ENGRAVED BY A. NEGRI.

## NEGUS NEGUSTI, AND THE ABYSSINIANS.

WITH PICTURES BY THE AUTHOR.

A WARRIOR EATING.

WHEN Gordon Pasha was shut up in Khar-toum, and the Egyptian garrisons in the eastern Soudan were menaced by the Mahdi's fanatical followers, the British and Khedival governments deemed it advisable to send a pacific mission to King Johannes of Abyssinia, to enlist the favor and assistance of the Ethiopian monarch, in the evacuation by the garrisons and Christian inhabitants of the several Egyptian towns bordering on the Abyssinian frontier then threatened by the Soudanese, and to allow them to pass unmolested through his territories to the coast.

Sir William Hewitt had been appointed the English envoy for this purpose, and the campaign against Osman Digna having lulled for a while, there was a general rush of war-correspondents for this opportunity of writing up and illustrating an almost unknown region. So many wished to accompany the mission that the British admiral was compelled to refuse all the applicants. Hearing of this fact, I would not appear before him to face a refusal, and I flattered myself that, not having applied, I was free by some other means to try to accompany the mission through this

wonderfully interesting and almost inaccessible country. I hurried by the first steamer from Suakim to Massowah, the port from which the mission was to start inland, and I immediately called on the governor, an American gentleman who had been for years in the service of the Khedive, and was now the envoy deputed by the Egyptians for Abyssinia. To his good nature I am indebted for one of the most delightful and interesting journeys I have ever undertaken.

Mason Bey, on hearing of my great desire to accompany the mission, at once attached me to his staff. Before the sun had set on the day of my arrival, I was ensconced in the palace as a sort of under-secretary, with free use of the Bey's larder, cellar, and cheroot-box.

On the afternoon of Monday, April 7, 1884, the flagships and forts of Massowah thundered a salute, as the Admiral landed and was received by Mason Bey at the palace stairs. In less than an hour the mission started on its adventurous journey. Before we had quitted the plains of Monkolu the sun had passed away, and as we began to struggle over the rough, undulating ground toward the Abyssinian chain of mountains, a deep, yellow gloom suffused the sky. But this soon gave way to the powerful but mellow light of the African moon, which was now casting long shadows of our men and beasts over the silver sand. Here and there the moonbeams lighted up in ghastly distinctness some wild Arab warrior, peering at us in curiosity from the bush along the road. A few miles farther, and the route turned abruptly to the right, and gradually began to narrow into the bed of a dried-up watercourse. We were now within a short distance of Saahiti, our intended halting-place for the night.

Presently, a few hundred yards in front of us, some white tents stood boldly out in the moonlight. To our surprise we found cooking-fires blazing, and an evening meal already pre-

pared for us. A good friend had arrived in advance of our party, pitched tents, and prepared a sumptuous repast. We owed all this courtesy to a gay old slave-dealer, who had recently given up dealing in live stock in favor of dead, which he sold in the shape of butcher-meat to the various steamers coming into the port of Massowah. I had seen this gentleman at the beginning of our journey, doubled up on a small donkey, and dressed in his ordinary fashionable attire, a light pink stuff gabardine, with yellow silk-embroidered sash bound round

test we had yet experienced. Many of us were compelled to swathe our heads in wet towels to lessen the chance of sunstroke. In the afternoon of the second day an officer with twenty men, sent down from the mountains by Balata Gubru, a frontier chief, arrived in camp for the purpose of taking over the king's presents, and of relieving our bashi-bazouk guard, which now returned to Massowah. At sunrise the following morning we moved in a southerly direction, skirting the Ailet hills along a mule-path, through mimosa woods teeming with

THE PALACE, MASON BEY'S RESIDENCE, MASSOWAH.

his waist. His face, almost cadaverous in its contour, was framed by a white bullion-fringed turban; his eyes were sparkling; and a sinister smile played about his lips.

Though our camping-ground was at least four hundred feet above the plains, yet there was no perceptible difference in the temperature. The thermometer was steady at something like ninety throughout the night. An hour before sunrise we struck camp, bade farewell to our gallant host, and started for Ailet. We soon began to experience rough traveling. Immediately on leaving Saahiti, the aspect of the country changed. The ground was strewn with huge granite boulders, and here and there patches of stunted mimosa or wild olive-trees broke our route. Always ascending, moving over chains of low hills, we kept to the dried-up watercourse, the bed of which so narrowed that it was difficult for us to make our way even in Indian file. The sun beat down upon our little caravan, making life almost unbearable. Occasionally we would be fanned by a slight breeze as we surmounted some ridge, from which the sight of the floating vapors still clinging to the faint blue peaks of the distant mountains cheered us with the fact that we were slowly though surely approaching a country of cool shades and running waters. Scorching sun, burning rocks, and shadeless mimosa-bushes held their own till we arrived at the wells of Ailet.

Our day's rest at Ailet was one of the hot-

game. We halted for the night at Sabagumba, where our guns found plenty of quail to embellish the evening meal. An hour before dawn found us ascending the Rara Pass, and at mid-day we camped in the narrow valley of Genda. Our mules had not had so happy a grazing-place for many a day. The ground was covered with wild clover, fine grass, and buttercups. A brook wound its way down the valley, sprawling over rocky beds, and hemmed in by tall grasses. Our sportsmen were soon busy on the sloping sides of the valley, thick with foliage and full of guinea-fowl. We remained in this happy place for one day, awaiting the arrival of the lieutenant of the Abyssinian chief Ras Alula. This officer came about midday, with an escort of a hundred ragged-looking fellows clothed in cotton knee-breeches, with togas in various stages of dirtslung about their shoulders. While a few were mounted on mules, the majority tramped on foot, armed with spears, swords, and muskets ranging from the first specimens of that arm to the modern Remington. There was no discipline or order with these warriors. They herded together in groups, or lounged about camp in pairs, staring and gazing at us in the rudest curiosity. Their leader, a short, spare man, with narrow face and close, cunning eyes, was a person of some distinction. He told us that Alula anxiously awaited our coming, that he was deputed to act as our guide through the passes to his chief's camp, which had been pitched on the plateau of

Asmara, seven thousand feet straight up the mountain.

The next day we entered on the most serious part of our journey. Our first few miles lay through mountainous scenery reminding me a little of our own Scotch Highlands, and still more of the Turkish Balkans. Birches, cedars, acacia- and box-trees, many rare orchids, and strange plants covered the sides of the gorges. Common flowers were in profusion; maiden-hair ferns and lichens brushed us as we toiled on our way. Some of the guard in our front played upon pipes roughly made out of the bark of trees. The notes, sweet and mellow, seemed to start all the birds on our route into song. Climbing up almost perpendicular passes a thousand feet or more, skirting for a time a rocky precipice, we suddenly emerged into a narrow valley, the aspect of which was unlike any we had yet seen. The whole foliage of this part of the mountain was totally unlike that a few yards below us. It seemed to have changed as if by magic, so unexpected was the transformation from European delicacy to African crudeness of color—the *Euphorbia candelabra gigantea*, bursting into bloom with clusters of red and yellow blossom; enormous aloes in flower; and cacti parasites clinging to the rocks, or trailing in great luxuriance from the trees. The sun, which had been shaded from us by the dense foliage below, now blazed out in all its fierceness, flooding the fantastic valley with a brilliancy that was superb and almost overpowering.

Next day we arrived at the foot of our last, but most difficult, ascent. The Maiensi Pass is one of the steepest routes for the passage of human beings to be found on the globe. It was utterly impossible to ride our horses up it; so we were compelled to take to our mules, and we had to nurse even these hardy little brutes nearly the whole way. A shower of stones clattering down upon us discovered a horseman scampering toward our party from the mouth of the pass above. Saluting the Admiral, the messenger told him that the Ras (governor), his master, had seen us coming, and thus early sent his greeting. The route now narrowing into a rocky defile, we suddenly emerged on the great Abyssinian plateau. As this new world dawned upon us, the slight eminence on our right became alive with moving horsemen: at least fifteen hundred cavalry began to spread out over the plains in our front. At a given signal they turned sharply, facing our party, then charged with seeming fury straight at us. They were all fierce-looking men, with headgear of handkerchiefs of various colors, or simply a wide white tape tied round their close curly hair, after the fashion of the ancient Romans. Some sported lion-manes, which, fringing their dusky

faces, made them look almost as savage as that beast himself. Skins of black leopard, over their red and white togas, swathed their bodies. As with couched spears and uplifted targets they bore down upon us, they yelled like maniacs, madly shaking their weapons in mock defiance; and when within a few paces, with one accord they suddenly curbed their horses. So quickly was this done that their chargers reeled back on their haunches; each warrior at the same time lowering the point of his spear, and in silence bowing his body before the envoys. Then afar off from over the plain came the sound of drums slowly beaten. The horsemen, wheeling round our flank, now formed an irregular line in our rear.

When the cloud of dust that for a moment enveloped us cleared away, we discovered far ahead, on a rocky height standing out of the plain, a solitary white tent; on each side of it, sloping down to the plain, lines of infantry were drawn up, forming a broad avenue through which our party advanced. As we slowly moved between the lines of these dusky footmen, the drums deeply sounded an Amharic greeting, the interpretation of which was: "How do you do? How do you do?"

The bright sunlight shimmering on the silver bolts of the circular shields of the horsemen, and on the metal-plated trappings of their chargers; glittering on the myriads of spear-heads; brightening up the motley coloring of their headgear and red-striped togas; and, above all, the measured beating of the deep-toned kettle-drums, greeting us in this odd fashion, made our first reception in Abyssinia a highly impressive one. The envoys dismounted a few paces in front of Alula's tent. That great chief walked forward, and shook them heartily by the hand. Ras Alula was a man of five-and-forty, of medium stature, with massive head, close-shaven face, and features somewhat Roman in type but almost as black as a negro's. This Roman resemblance was suggested even more by a toga thrown gracefully about his figure, giving him the appearance of a statue of the great Cæsar worked in bronze. But all this majesty was soon dispelled as he squatted on his throne and began gesticulating. The continued clutching at his drapery, the swaying of his body, and the long curved sword shaking out behind from the folds of his toga, gave the great Amharic chief more the appearance of a chimpanzee. The reception was cordial, but not effusive. Repeating the questions the drums were still asking: "How do you do? How do you do?" we in answer said, "Very well, thank you; and how are you?" Alula slowly replied, "Thank you, I am well." But to our anxious inquiries as to when and where we would meet the King, the Ras was very

UP THE MAIENSI PASS.

reticent, giving us an answer worthy of a European diplomatist. He said, "Only God and his Majesty know that." We then retired till our sable friend should become more communicative.

Asmara, where we camped for a time with Alula, is a village of at least 2000 inhabitants. The houses are built of stone, and are circular in form, with thatched, extinguisher-shaped roofs. Its church is also of the same material, and is highly decorated with crude pictures of the Virgin and Child, the apostles and saints. Before the sun left the plateau, presents came into camp, and Abyssinian hospitality began. Grain, chopped straw, thin cakes of unleavened bread, jars of honey, and horns of tedge, with two or three beeves and some black sheep, were the gifts for the day. The next morning we unpacked our presents for Alula and his lieutenant, Gabru. To the great chief we presented shot-guns, rifles, ammunition, and accoutrements, some pieces of silk, a carpet, and a Turkish ewer and basin, in brass—the latter not a reflection on his lack of ablution, for he was the cleanest native we had yet met. Gabru received a rifle, a carpet, and some whisky—the last-mentioned gift being more in accord with his taste than the ewer and basin, for we had our suspicions that he would have made a shield of the basin, and a jar for alcoholic drink of the ewer.

At sunrise on the third day of our advent into Abyssinia, we began our journey across the great table-land to Adowa, escorted by Alula with his whole army. The infantry in irregular masses ran on in advance; the cavalry in rough formations moved in our rear. As we journeyed at a quick walking-pace, the stream of foot-soldiers in our front was augmented by stragglers who had been billeted in the adjacent villages. At a nod from Ras Alula, who rode on the right hand of the envoys, the cavalry would send forth warriors galloping from each flank to do mimic battle with one another for our amusement, showing their dexterity with lance or saber, each man seemingly fighting desperately, trying to gain a smile of approbation from his chief. The nearer we approached Addi Techlai, Alula's permanent camp, the warmer grew the mimic fight; the warriors being stimulated by the sight of their women watching their prowess from the heights. A few hot-headed youths used their swords in earnest, and blood began to flow; but a signal from the Ras stopped further mischief, and, the rough sport coming to an end, the horsemen rejoined in our rear. Suddenly, without any perceptible orders, the cavalry broke into a gallop, and in a cloud

of dust raced one another to the camp, struggling up the rocky and almost perpendicular height on which stood the stronghold, three hundred feet above us.

The following day we said good-by for a time to Ras Alula, and started *en route* for Adowa. Traveling in a southerly direction, we left the Ras's stronghold on our left rear. Our route lay through roughly plowed patches of ground, between low, rocky hills, from which Addi Techlai, though impregnable to primitive modes of attack, could be made untenable by means of modern artillery.

In this part of the country our surgeon was kept busy with many operations. He had just extracted a stone bullet which had been in a man's foot for two years. The patient showed his gratitude by bringing in some cakes and honey. With the exception of a few cow-doctors and herbalists, these poor people are without medical aid. Disease is rampant everywhere, consumption prevailing; scrofula and other loathsome complaints come next. Seven out of every ten persons have some kind of disease that shows itself in sores and eruptions. No doubt their excessive dislike for water is one of the principal causes. The fashions of the women's headgear are various, and do not differ much

from the mode of the men. The hair is worn short and curly, or in thin plaits taken from the forehead back over the cranium in corduroy fashion to the nape of the neck, where it narrows and is fixed up in a knot. Young girls will shave their scalps close, leaving a halo of fringe, perhaps terminating in loose streamers behind. This fashion is indeed very pretty, especially when framing handsome faces, which are by no means uncommon in Abyssinia. Drapery thrown about their well-shaped figures (worn

when their gowns are in rags) makes them absolutely statuesque, and these damsels would be attractive but for the nasal as well as the optical knowledge of their uncleanness. An Ethiopian will tell you without a blush that he is necessarily washed at birth, cleans himself on his marriage morn, and hopes to be washed

The men are partial to cartridges, and some had a vague idea of their value, offering an egg apiece for them.

One morning we passed a caravan of ivory; the tusks were bound with rawhide and strapped across the backs of mules, who staggered under their precious loads toward

THE TOWN OF ADOWA, FROM THE SOUTH.

after death; that once every year he dips himself in the river on the festival of St. John the Baptist, and regularly every morning he wets the end of his toga with the moisture from his mouth and freshens up his eyes. Whenever he feels his hide harsh and uncomfortable, he anoints himself with mutton fat. Of a morning one may see the *jeunesse dorée* of a town stalking with body erect, and with about a pound of butter stuck on their heads, gradually melting under the increasing power of the sun. The men may look a shade cleaner occasionally, caused not by any act of their own, but through the accident of being for hours in a rain-storm, which at this season occurs daily; but even then the odor of rancid mutton fat impregnates the atmosphere wherever they may be.

In passing through the town of Godafallassi, a place of 350 houses, and boasting a market, we had some hopes of finding the inhabitants in better circumstances and condition. They were in even a worse state than the people of the villages we had passed through. They herded together in their huts with their cattle, fowls, dogs, cats, and a Noah's ark of insects, which they seem to foster with the greatest care, by not touching soap and using very little water. They were more or less civil, but show no particular courtesy to strangers. They preferred cloth or gaudily colored handkerchiefs to money for the coarse food they brought us.

Asmara, *en route* for the market of Massowah. On arriving on the edge of the plateau, a scene of great beauty presented itself. Our route lay down a wide gorge, opening on an ocean of little blue hills, looking with their purple hues like the wavelets of the Atlantic suddenly arrested in motion. Descending the precipitous sides of the plateau, a crowd of monkeys of all sizes and ages scampered away in great dismay, chattering and shrieking as some of our sportsmen fired in the air. The valley of Gundet, which we were now traversing, became famous by the utter rout of the Egyptians in their fight with the Abyssinians in November, 1876. Here the main body of the invaders, under the gallant young Dane, Colonel Arendrup Bey, was cut to pieces. Further on, toward the Mareb River, the vanguard under Count Zichy left their bones to rot in a forest of mimosa. As we passed this scene, their bleached remnants still lay scattered there, marking the spot where a rallying square had stood to stem the torrent of Abyssinian spearmen, who suddenly rushed down upon them from their rocky cover of enormous granite boulders that hemmed in the defile. Remaining a little in the rear of our party, one of our native guard described to me the manner of the attack: how the Ethiopians crept from their cover on hands and knees; the surprise of the enemy; the short struggle and sub-

THE DANCE OF THE GROOMSMEN, ADOWA.

sequent flight of the Egyptians, and their utter annihilation. The natives acknowledge to this day that Arendrup's troops fought dearly for their lives. In those days the Egyptians had some mettle in them. The battle of Gundet is memorable, as it was the beginning of the decay of Egyptian power in Ethiopia and the Soudan. Disorder and misfortune have overwhelmed them ever since, and the Turk, who was once regarded with fear and respect, is now looked upon in that part of the world with loathing and contempt. In the valley of Gundet the foliage varies from the monotony of the prickly mimosa to sycamore, butternut, and wild fig of many kinds, and on the banks of the Mareb weeping willows overhang its rocky bed.

Leaving this historical valley, we once more ascended hill after hill covered with dense fo-

liage, and here and there on their slopes were clearings with patches of cultivated ground. Always ascending, we at last reached the great Dari Teelai plain, one day's march from Adowa, our objective point. After traversing a sandy track for six hours, we encamped, but spent the last night of our long march in sleeplessness, on account of the cries of hyenas and jackals, and were made miserable by the visitations of spiders and scorpions, two of the party being severely bitten. In the early dawn we marched for the capital of northern Abyssinia. This last day's journey was considered by some of us the most difficult and trying of all. A magnificent view of the valleys and hills we had passed over in the last six days lay before us. A more picturesque but wild, inhospitable, and rugged-looking country one could hardly imagine. In the far distance, forming the hori-

zon, in a long level line lay the top of the Hamasen plateau. At the base of its precipitous sides stretched the valley of Gundet. Then a sea of hills piled up until they sloped into the plains of the Dari Teelai, the end of which was shut in by the numerous heights over which we had just toiled. On right and left of the plateau, the valley, and the plains,

merous villages, in such odd places and close proximity as to suggest the probability of their once being part and parcel of the city itself. The pillage, massacre, and incendiarism of hostile or rebellious tribes, which on an average take place every ten years, have doubtless left these remnants of happier days quite isolated, giving the Abyssinian capital a most poor

DRAWN BY A. CASTAIGNE, FROM A SKETCH BY FREDERIC VILLIERS.

MOURNING HER BABY.

ENGRAVED BY M. HAIDER.

rugged mountains reared themselves in volcanic confusion, their shapes so eccentric that they seemed to mingle with the thunder-clouds that were beginning to discharge their waters in a distant valley. Reluctantly turning our backs on this grand and impressive scene, we descended into the valley of Adowa. On one of the slopes far away to our left, from out the gray monotony of surrounding habitations, shone the golden Coptic cross on the hay-thatched cathedral of the city of Adowa.

The capital of Tigré, or northern Abyssinia, appears to have been once a city of much greater importance than it is at the present day. It consists of 800 or 900 habitations, covering the spurs of three hills on the southeast end of the valley, around which are scattered nu-

merous villages, in such odd places and close proximity as to suggest the probability of their once being part and parcel of the city itself. The pillage, massacre, and incendiarism of hostile or rebellious tribes, which on an average take place every ten years, have doubtless left these remnants of happier days quite isolated, giving the Abyssinian capital a most poor and disjointed appearance for a representative city. As soon as we crossed the Mareb we found that the peasantry treated our advent with great indifference, and were very reluctant, in spite of excellent pay, to bring in supplies to our camp. This was owing, we discovered, to our arrival in the district belonging to the King's son — our powerful protector, Ras Alula, having no control out of his own country, though he was one of the most powerful of the Abyssinian chiefs, and the warden of the marches. The country is split up into petty chieftainships, the ruler of each district receiving all revenues from whatever sources, and having complete power of life and death over his people. His only obligation to the King is to follow him to war with all his available fight-

ing-men. Next to the King, Alula had the largest following, so Johannes had a wholesome respect for him, for his weight thrown in with any one of the pretenders to the throne would be a serious matter for the reigning house. The young heir apparent, jealous of the power of this great chief, resented it by showing to us that he alone had control in his own-district, and made us suffer by withholding the necessary supplies. So far was this jealousy carried, that on our arrival in Adowa the governor of the city delayed calling upon us, and when he condescended to do so was so drunk and stupid that he had to be supported by his interpreter on the road home. He forbade his people to bring us any supplies. This was, indeed, a very serious thing, for travelers in Abyssinia are dependent in this matter upon the pleasure of the governor or chiefs. In Adowa there are no shops or hostelrys of any description, the people getting their provisions from the market held once a week. Tedge and beer are brewed, corn is converted into flour, and all cooking prepared in each household. Therefore, unless people are allowed to sell or give hospitality, the traveler's chance of escape from starvation is a small one. We had supplies of a certain kind with us, and could have held out a few days, but such food would have been rejected by our native followers, who would have suffered great privations. Sir William Hewitt was compelled, therefore, to forward a letter to the King, stating that unless the prohibition of supplies was withdrawn, it would be impossible for us to move farther. In a few days a reply was brought back by Alula, who had been summoned by the King, which showed the pride and arrogance of the Ethiopian Christian monarch. The translation is as follows:

Message of King John, by the Almighty King of Zion.

May it reach Sir William Hewitt, commanding ships of war in the East India Station. How do you do? Thank God, I and my army are quite well. I am taking some baths. I send you Ras Alula to assist you in counsel, provisions, and everything. As your Excellency is going to make friendship between two kingdoms, don't be in a hurry to go back. I will come soon.

Written this 24th day of Mengared, Camp Dubba.

With the exception of Ras Alula, who was a man of courteous manner and no mean ability, the chiefs and officers, though receiving suitable presents, according to their rank, from our hands, would also try to obtain money from us under all kinds of pretenses, we knowing perfectly well that a refusal meant petty delays and difficulties in supplies. Even a chief of very high standing would ask for dollars with-

out any apparent shame, and if the amount of the gift did not come up to his expectations, he would politely say, "I require nothing but your friendship," which meant that he would be as unfriendly as possible until the required sum was forthcoming. The King might have put a stop to it at once, for no monarch is more absolute or despotic in the world. His word, proclaimed in the market-place with a prelude of tom-toms, is the only law, and he has absolute power of death and mutilation. Political offenders and obstructionists are arrested, chained, and placed on the small table-land of Abba Salama, a high, rocky, and precipitous mountain about thirty miles from Adowa. So sheer and steep are its sides that the prisoners are drawn up by ropes. Their chance of escaping is impossible, unless they run the risk of dashing themselves into eternity on the rocks below. On this lonely height there is soil on which they may grow grain, and there are wells with good water. There is no speaker to keep order, and they may, if they choose, abuse the prime ministers and crowned heads to their hearts' content, but they return no more to the ways of the world.

The King of the Ethiopians, although absolute in power, and doing pretty much as he pleases, has an ear for the Church, and superstitiously follows the fiat of the high priests. Within a stone's-throw of Adowa is a village called the Abuna's. It is here that the Archbishop, or Abuna, resides. This ecclesiastical dignitary is always a foreigner. The Abuna is simply a prisoner in the country, and, unless followed by his brother churchmen, he may not leave the precincts of his village, a jealous eye being kept on all his movements. He has the sole power of consecrating churches, and of ordaining priests and deacons, and holds over the heads of the people the sentence of excommunication, which is looked upon by all with the greatest dread. By these means, in many crooked ways, he can amass money, and perhaps eventually return to his native monastery should the vigilance of his guards be slackened. The Tchege comes next, and is the native head of the church. He and the Abuna should lead a life of rigid celibacy. The priests are allowed to marry if they choose, but the majority lead a life of gross immorality. The confessional affords an easy means for gratifying their desires, and also for obtaining the liquor that cheers. The Church in this country is almost as profitable a profession as that of the soldier. There is no regular pay attached to either, but the followers of both live upon the people. There is no encouragement to ambition or advancement, for as soon as a man begins to grow rich, he is robbed spiritually by one and materially by the other.

We found the walls of the churches in Abyssinia covered with pictures of scriptural history, and the walls of the cathedral with the exploits of Johannes. His victories over the Egyptians at Gorra, and in the valley of Gundet, are fully represented in tones as florid as those of advertising posters at home. The native artist does not make up for crudeness of color by the accuracy of his drawing, and if these pictures have any merit it is in their originality of treatment. For instance, in the cathedral of Gundet, in a picture representing the Israelites crossing the Red Sea, Pharaoh carries in his right hand the latest specimen in six-shooters, and in his left he holds a pair of opera-glasses, while the Egyptian host sport Remington rifles. All movement of figures is from right to left, and in all pictures heads are full-faced, with the exception of Satan and the hated Egyptians, who are painted in acute profile, to show their lack of honesty and good faith, and their inability to look you straight in the face. It is a deplorable fact, and one which, ladies will say at once, only proves the ignorance and barbarity of the Ethiopians, that the evil spirits in these compositions are always represented by the softer sex, generally showing their naughtiness by exhibiting their tongues. The church painter goes so far as to question the gallantry of St. George, the Abyssinian patron saint, by depicting that warrior, instead of doing battle with the dragon, as spearing the graceful, undulating form of a long-tongued woman.

The Abyssinian has a singular superstition regarding eating in the open. To him a fit of indigestion from over-feeding would mean the evil eye. He would feel assured that some part of the performance of appeasing his appetite had been observed. In walking along a highway in this country, I came across what appeared to be a large bundle of washing just a little off the road. On approaching it, the movement going on within was plainly discernible. Covered up in their *shemas*, or cloths, were three men eating their midday meal. So much in fear are the people of the evil eye, that they carry amulets containing prayers, and rolls of parchment several yards long; and pictures illustrative of the triumphs of the good spirit over that ocular absurdity are kept in their houses for protection. If an Abyssinian sells you anything, and is well inclined, he will caution you to keep it indoors or covered up; for if an evil eye should fall on your purchase it may spoil or disappear, which latter contingency is much more probable in Abyssinia. I had some experiences of the kind of evil eye that caused goods and chattels to disappear. It gleamed for an instance in the head of an Ethiopian whom I caught walking off with

some dollars from a pile in our paymaster's tent; the corner of the evil eye smiled innocently when detected, but the smile faded away under the influence of the paymaster's boot.

On the return of Ras Alula from his visit to the King, we certainly fared a little better, and our envoy was offered a house, with a compound wherein to pitch his tents. We had already settled down comfortably about a quarter of a mile from the city, in a southeasterly direction. Our encampment numbered twenty tents, and Mason Bey, with his equatorial experience, erected several excellent grass huts, so that we were in comparative comfort and protected from the sun, the rays of which at this early period of the season were quite hot enough. The huts brought the temperature during the day down to 87°, and kept it up to 47° of a night, for after sundown the thermometer falls rapidly from 110° to 45°.

Rather interested to learn how far Abyssinian hospitality would go in the way of a house, we rode into the town one afternoon to view the King's gift. After threading our way through several narrow streets, we arrived at the outer wall of the mansion. Passing through the gateway, we crossed the compound, which had the appearance of a scattered dunghill, and reached a tall, quadrangular-shaped building, composed of thick walls of mud and stones, with an extinguisher-shaped thatched roof. Three doors, one on each face of three of the walls, opened into a hall. Entering through the center, we discovered on each side of the gangway the head of a mule protruding from two narrow stables let into the wall. The animals were so close that they rubbed their noses on our coat-sleeves and sniffed our pockets for grain. In a recess fronting the entrance was a dais a few feet high, built of mud, covered with a carpet and some straw, with a dirty curtain stretching across the recess and overhanging the dais. This is where the lord of the house would place himself to receive visitors, or to recline after a feast. There was also a native bedstead, a low four-post affair, with strips of rawhide stretching from side to side. This, with the exception of a stool, was the only other article of furniture in the place. The floor was very much like that of an ill-kept stable, covered with muck and frowzy straw. Besides a woman and her little baby, both lately greased and fragrant in the extreme, there were a goat and a few fat-tailed sheep. From numerous holes and open cupboards in the walls fowls cackled and pigeons fluttered, disturbing the cobwebs, and spattering the occupants below with lime. Scattered here and there in corners were tedge-horns, broken honey-pots, and debris of all descriptions. The scene was indeed novel, but not entertaining, for the stench of the animals, and

the multitudes of flies and bees attracted by the honey-pots, made us think of moving. The chief of our escort, not seeing, as he expected, the pleasure depicted on our envoy's face, told him that there was a still better room above, where he could receive his friends in quietude and make a perfect little sanctum. We looked around in some surprise, for no signs of a stairway were visible. One of the servants smiled upon us with a certain touch of contempt, and, jumping on the dais, seemed to crawl up the wall like a cat, disappearing through a hole, out of which he eventually looked down upon us, expecting the envoy to follow. Whether the Queen's representative thought it, in virtue of his position, beneath his dignity to go through these gymnastics, or whether he thought his days of cadet-like agility had passed away, he did not accept the invitation to explore further the wonders of the place, but returned to his camp, leaving this abode of Abyssinian hospitality to the original occupants.

Abyssinia is a country where, if marriage is a failure, it can be easily dissolved. There is absolutely no legal or holy tie. When a man is desirous of marrying a girl he directly applies to her parents. The maidens, like those in many European countries, are seldom consulted on the question; the lover arranging with the father or male relatives regarding her dower, which generally means a few beeves, sheep, or pieces of cloth, and sometimes gold. On the marriage day the bridegroom presents himself with his best man at the house of his future father-in-law. Much feasting goes on till the bride is carried off by her husband, generally on his shoulders, while the male relatives closely follow, making a canopy of their togas to keep off the rays of the sun, or perhaps the effects of the evil eye. Behind come a crowd of young girls and boys, methodically lifting their arms above their heads, and clapping their hands to the measured beating of tom-toms carried by men running along the flanks of the procession, who also blow long trumpets. The happy couple that I saw married outstripped their followers, with the exception of their best man, and at last reached the town green, where the groomsmen formed a screen with their cloaks round the happy pair, when the deferred courtship began. It is a custom for the supporters of the groom, generally six in number, to be present on this occasion, and for many days afterward to go round visiting the houses of the mutual friends of the married pair, extolling the beauties of the bride and the accomplishments of the groom, generally finishing up with a grotesque dance, which is much enjoyed by the enthusiastic neighbors, crowding round the open doorway. Though this marriage can be annulled according to

mutual agreement of bride and groom, if, after years of happiness together, they wish to cement the tie more closely, the pair simply attend the holy communion together in church, and the marriage is then looked upon as indissoluble.

There is a touch of the old Roman "Mark-Antony-over-the-body-of-Cæsar" custom about Abyssinian burials. The corpse is brought from the house of death to some prominent clearing in the town, where the women relatives and hired mourners sit around in a circle, lowly chanting some weird dirge. The chief mourner in the case that I saw, the mother of a child, stood upright over the little body, which with exposed face lay on a stretcher. With loud lamentations she beat her breast, tore her hair, bewailing her loss; presently in softer tones she extolled the perfections of her lost one. Then she raved again, growing more and more frantic every moment, till her slave entwined her arms about her mistress and led her sorrowing away. After that the men, who had been standing all the time at a respectful distance, came in and bore the body of the child to the burial-place, the women returning to the house to prepare a feast for the male mourners' return.

We found that in many parts of the town of Adowa we were looked upon with the greatest horror by the womankind. In passing down a narrow street the women would keep close to the walls, turning their backs on us and whispering, "O you creatures with pink skins!" Throughout Abyssinia, cloth, colored pieces of handkerchiefs, and bars of rock-salt ten inches long, serve as the ordinary medium of barter. The only coin in the country is the Marie-Thérèse silver dollar. Twenty-four bars of salt go to the dollar, therefore I always avoided changing dollars, and for small wants got on well by trading empty beer-bottles, of which we were always adding to our supply, getting for each two chickens and a dozen eggs. Worcester-shire-sauce bottles ran higher because of their glass stoppers. If I had felt inclined to settle in that country, I could have taken a chief's daughter in marriage, in spite of my green eyes and pink skin, on account of a large cut-glass cologne bottle, with a bulbous glass stopper, that I happened to have with me.

When King Johannes eventually came to meet us, for many hours before the advance-guard of his army appeared on the hills overlooking Adowa the forty royal speaking-drums were sounding his advent in measured beatings, which could be heard for miles. Throughout Africa the drum has been the long-distance telephone of the natives from time immemorial, for they literally speak with their drums.

Mr. Glave, who has recently returned from the tributaries of the Upper Congo, tells remarkable stories of what this drumming can do in that part of the country.

In Abyssinia taxes are collected by the sound of the drum, and woe betide the tardy husbandman if his beeves, sheep, or bread are not forthcoming. "Slay—spare not!" roll the distant thunder of the king's drums, and the cavalry collectors swoop down on the village. The low, deep sound of the tom-tom has a weirdness about its tone which is highly effective, certainly to those not subjects of the King; and in the morning in the silent darkness the drums signaled the coming of Johannes. It was an exceedingly grateful sound to us, for we had been virtually prisoners, anxiously awaiting his arrival. The morning light was well on the hills as the advance-guard of the King descended into our valley. First came irregular cavalry, who scattered over the uneven ground without any particular order or formation. Then in a compact body came the Abuna and other church dignitaries, with a choir of boys in their front, chanting. At an interval of a few yards rode the King, dressed in a black silk gabardine, bareheaded and barefooted, mounted on a mule richly caparisoned with silver and red leather. A large magenta silk umbrella was held over his head by a page running by his side. At a respectful distance, to prevent the pressure of his unruly subjects, were footmen marching in Indian file at short intervals. The King's son rode beside his royal father, also mounted on a mule. The rear was brought up by the army, infantry and cavalry all huddled together, fighting their way to the front so that they could get a better view of the arrival at the palace. The palace—if the three huts which constitute the king's residence can be called one—is perched in a walled compound on one of the highest hills looking down on Adowa. The courtyard is entered by one narrow gateway, with a signal-tower above it. On each side of it two seven-pounders, presented by the Admiral to the King, had been placed the night before. At the last moment Ras Alula was struck with the brilliant idea of firing a salute in honor of his monarch's entrance into Adowa, so he hurriedly sent down to our camp for the necessary men and blank charges. When our scratch crew arrived the people were too excited to pay any attention to the order to stand clear of the guns, and with great difficulty six rounds at very varied intervals were got off, to the astonishment of the crowd, who rushed about after each round in great wonderment, some warriors riding up flourishing their spears at the mouth of the ordnance. What these intrepid warriors could not understand was the

sponging out of the guns after each discharge. They thought this part of the function unnecessary delay. It was lucky, after all, that Ras Alula sent for our men to work the pieces.

The camp-followers with the baggage now made their appearance in large numbers, and tents of all descriptions were soon pitched up hill and down dale, the beasts of burden making for the fields and eating up the grass like locusts. The inhabitants of Adowa had been brewing tedge and making bread for the last three weeks, but how they were to provide for this inroad of 7000 warriors and their animals was quite a puzzle. The King's hospitality toward us began that evening, much to the delight of our servants, for two oxen, several sheep, 500 loaves of bread, many jars of tedge and honey, and a few horns of red pepper were brought into camp by the royal slaves. This quantity became our daily allowance while we were guests of Adowa.

The interior of the royal residence had nothing to recommend it above other native interiors. The walls were of plain mud, and of stone unevenly fitted, and without any attempt at decorative art, and not even draped with cotton cloth, as some are. The earthen floor was bare, with the exception of a few well-worn pieces of Brussels carpet, leading from the entrance up to the foot of what served for a throne. There was no attempt at state; a few domestics lolled against the walls, and on the left side of the throne stood a priest, whose seeming occupation was to keep the flies from his own nose with the aid of a piece of cow's tail, but in reality, and in conjunction with a servant swaying a horse-hair switch, was keeping those little torments from feeding off the butter on the royal head; for his Majesty indulged in grease as well as his lowly subjects. The Negus squatted in the middle of his throne, his body totally covered from tip of nose downward, to show his dignity, pride, and exalted position, and the utter indifference he felt to everything and everybody else. And thus he remained till our numerous presents were brought in and placed at his feet, when he even condescended to smile his thanks, which lighted up his otherwise gloomy face and made it rather pleasant. It is lean and wan, broad just over the brows, which are perfectly arched; his large black eyes are deep-set; his nose is slightly Jewish, but small; and his mouth and chin—for he now gradually dropped his toga, which fell slowly down over his knees, discovering the order of Solomon in gold, attached to a chain around his neck, glittering on a gown of black silk—showed a weakness that belied the upper part of the face. His color is almost negro in its blackness. There appeared to be no one in

particular to keep the door or to lift the cloth as one entered or passed out. When we did the latter,—after asking permission to depart, which the King cheerfully responded to by saying, “Echee,” which means in plain English “All right,”—we had to move the cloth for ourselves. Once out of the royal presence, an unruly mob of soldiers and servants jostled us wherever we walked. Sometimes an indignant chief would lay about him with a stiff bamboo, clearing our way for a time, but the people were like flies; their appetite for curiosity seemed all the more sharpened, and they swarmed around in large numbers. In a corner of the compound I noticed that a large bowser had been erected to cover with its leafy shade at least 500 men. This was where the warriors, chiefs, and courtiers of the King feasted. We were none of us invited during our stay to these entertainments, Johannes knowing full well that Europeans are not accustomed to the luxuries of an Abyssinian banquet; and for one, I was heartily glad we were not honored with this mark of his favor. The food was, as usual, warm raw flesh, with a sort of haggis of

intestines of the animal, flavored with ox-gall and red pepper, to make it more piquant.

The Abyssinian soldier is generally a frugal creature; on the war-path he has to put up with rations of jerked beef and a little flour, which he carries slung over his shoulders tied up in an end of his toga. A slab of stone will serve whereon to mix the flour with a little water, the quality of which he is not particular about. He will then make a paste; a fairly round stone is sought for and heated in the camp-fire, and is then used as a center around which the dough is built. This stone dumping is then placed in hot ashes, and in a few moments is cooked sufficiently to serve as bread. Red pepper made into a paste with grease is carried in a small horn attached to his girdle. Of luxuries the Abyssinian soldiers have few. Smoking is not allowed, and the breaker of this rule is liable to lose his nose and lips in punishment. Each man carries his little pot of stuff in his belt. A short time after the coming of the King we returned to the coast, and our mission was ended.

*Frederic Villiers.*

## A FRIEND OF THE FAMILY.

CHRISTIE was very small, even for his tender years, and he had red hair and the freckles that always go with it. As far back as Christie could remember he had sold newspapers on the streets. The experience he had gained in this line was a very

extensive one, and had completely destroyed any ideas he might otherwise have had of a domestic life. For the last few summers he had given up the paper business, and blackened boots on a ferry-boat. He might have done very well at this, but he preferred to sit on the deck and listen to the three Italians who played popular airs on a harp and two violins. On the last few trips Christie would generally find that he had no money to pay for his supper and lodging, so he would get down to work and try to make enough to keep him until the following day.

He was a very improvident character, was Christie, but he had no one depending on him,

so it really did not make very much difference. It frequently happened that when night came on he found himself without any money at all. On these occasions he would spend the night at a shed on a pier in the East River.

Christie was a great favorite with the watchman at the pier, and the old man was always rather glad when the boy had had a bad day and was forced to spend the night in the shed, for Christie was very good company, and sat up until late at night telling the old man of his day's adventures, and making plans, and getting advice for the future. Young as he was, Christie had seen more of New York than most men of forty. He knew the Bowery and the East Side, every bit of it. As for the other side of the town, he did not care for it; his ambitions did not lie in that direction. He had already tired of New York, and wanted to get out in the world and travel from place to place. He was an enthusiastic admirer of the country and the water; and the little green parks of the metropolis, and even the waters of the bay, did not afford him sufficient of either. He was a

born rover, and heartily dreaded any kind of regular employment. So far as he could see, to travel with a circus would about suit his ideas. But his friend of the pier looked to something higher for his protégé, and constantly told him of the many hardships the circus people had to endure: how they never slept, but worked all day and traveled at night. This view of the situation did not strike Christie's fancy at all. It was the music, the always changing crowd, and the out-of-door life that he wanted. Whenever he saw a circus billed he worked very hard and slept on the pier so that he might save enough money to be able to go just as often as possible. When the first day came for him to go he never did any work at all, but went over to the grounds early and talked to the tentmen and any one connected with the circus who would listen to him. The accounts they gave him were not very encouraging, and generally tallied with those of his friend on the pier; but Christie would not be convinced.

It was in the spring of the year, and Christie was not yet twelve years old, when he got a chance to satisfy his life's ambition. It was not a first-class circus, but it had two rings, and sometimes played as many as three days in one town. The duties assigned him were not very onerous, and his salary was correspondingly small. Before the performance began, he stood behind a wooden stand and helped a man to sell peanuts and lemonade. At eight o'clock they left the stand, and while the man carried around trays of lemonade Christie peddled peanuts among the audience.

For all of this Christie was paid only five dollars a week, but he was pursuing his chosen profession, and was much happier than he had ever been before. His great pleasure was in the morning, when he rode a donkey in the procession, and afterward stood outside the tent and was surrounded by a circle of small boys of the town, and was sincerely envied as an attaché of "Clyde's Monster Allied Shows."

Marcus Clyde, the proprietor of the show, was perhaps no better or no worse than the proprietors of small circuses usually are. He had originally been a butcher, then a horse-dealer, and on account of some bad debts had taken an interest in a small circus. From silent partner he had drifted into sole proprietor. Now he wore a high silk hat, and a diamond horseshoe in his shirt-front, and drove about the circus grounds in a buggy, which was always taken along for his personal use. He knew the name of every man and woman connected with the show, and frequently superintended the raising of the tents when the manager, Mr. Ross, was indisposed or drunk. He knew Christie well, and frequently honored him with a ride in his buggy. On these occasions the red-

haired boy amused him by recounting some of his escapades in New York. He used to embellish them a good deal, for Christie wanted to appear a person of importance in the eyes of his employer, and had, indeed, strong hopes of some day becoming a junior partner of the Allied Shows.

The proprietor's liking for the boy gave Christie a certain importance in the eyes of the other employees, and he was generally regarded as the mascot of the company. But Christie did not care very much for most of the people. He lavished all the affection he had on one family called Boynton. There was Boynton, his wife, and their little girl Patricia. The man did a bare-back act, in which he was assisted by the little girl. The woman, who had been born a little above the circus business, confined herself to riding around the ring dressed in a habit and a high hat. She really rode very well, and the act was extremely popular with the masses.

The friendship between Christie and the family came about through the boy's devotion to the daughter Patricia, or "Patsy," as she was called by the circus people. She was very pretty, with her long yellow hair and blue eyes, and Christie no sooner saw her than he found himself very much in love with her. The first time he saw Patsy was when she was doing her act with her father in the ring. Dressed in a short, red silk dress, with red stockings and gold shoes, she was led out from the dressing-tent. Her father took her on the horse with him. Then he stood up and held her out at arm's-length, with one of her feet resting on his hip, while the horse slowly galloped around the ring. The act ended with the little girl standing on his shoulders while the horse jumped some low hurdles. When, amid the shouts of the audience, Boynton led the girl from the ring, Christie followed her, and talked with her about her act, and how she had learned to do it, and what she generally thought about while she was doing it.

In a short time the two children became great friends, and the Boyntons almost adopted Christie as their own. The girls he had known in New York were very different from Patsy. So different was their language and the way they spoke it that the low English voice of this girl sounded almost like a different tongue to Christie. There was much time in which neither of them had anything to do, so the two children used to go on trips of exploration around the town in which the circus was stopping, or out into the country, where they played like other children who do not have to work for their living. As long as Christie was with her he did not think of the circus, and was only sorry when the time came for him to go back to the peanuts and the lemonade.

It does not take a girl of twelve very long to reciprocate such a strong passion as Christie's, so in a short time Patsy came to care for the boy as much as he did for her, and together they even planned to marry some day and have a circus of their own. He would have a buggy even better than Clyde's, and she would always drive by his side. Some day they would make enough money to retire, and together they would go back to her home in England, which she told Christie many times was the most beautiful place on earth.

It was in August that Boynton came to the manager one morning and said that his girl was too ill to appear. She had some sort of fever, and the doctor said she must not leave the hotel. Then he suggested that Christie might be allowed to try the act with him. The manager consented, and the horse was brought out into the ring, and Christie had his first rehearsal. It was not very difficult, and so long as he kept cool there was really very little danger of falling off. He was a little shaky at the afternoon performance, but at night he felt more at home, and when he had finished the act and ran out into the dressing-tent, with the applause of the crowd ringing in his ears, he was happier than he had been or ever hoped to be in his life. The next day Clyde got him a beautiful red suit of his own, with silver spangles all over it, and a white wig to cover his red hair, which, it was found, did not match with the red of his suit at all.

In a week Patsy was up again, had rejoined the circus, and was able to go on with her act. If it had been any one else than she, Christie would have very seriously objected to his return to the peanut-stand. But as long as it was Patsy, he was only too glad to see her out and able to start again on their long walks. But now that the ice had been broken, and Christie had been tried and not found wanting, Patsy often resigned her place in his favor, and he had many opportunities to wear the red tights and the white wig.

And yet Christie was not perfectly happy. He had seen so much of the Boyntons that he knew their affairs pretty well, and his New York training had not dulled his powers of taking in a situation. He knew that Mrs. Boynton was not altogether happy in her present position. She had left a comfortable home to run away with a circus performer, and had gradually drifted into the business herself. As time wore on, and the romance wore off, she put the blame of her position more and more on the man who had taken her from her home. As for Boynton, he worshiped his wife as much as men usually do who marry above them and are never allowed to forget it. He tried to keep her out of the ring and away from the public, but as long as

she had to spend her life traveling she insisted on doing a turn, as it gave her a certain amount of excitement and a little more money for the winter months, when they were idle.

Now Christie had noticed that the relations between the two had been very strained of late, and he thought he knew the cause. There was a man connected with the business part of the circus who had been very attentive to Mrs. Boynton, and Christie saw that the husband was desperately jealous. The woman had always borne such a good reputation in the company that no one attached any importance to the affair, regarding Mrs. Boynton as perhaps a little foolish, but nothing more. The flirtation had been going on for several weeks, when they came to a little one-night stand in Connecticut. Patsy and Christie had gone out for a walk after the afternoon performance, and had eaten their supper in the tent with the other employees on their return. When Christie went to his stand that night the man asked him if he had heard the news.

"What news?" said Christie.

"Only Mrs. Boynton has run off with the business manager, Ross. That's all."

Christie looked very serious, and ran his fingers through his red hair. He had never had any experience in domestic tragedies before, and as a friend of the family his duties were not at all apparent to him at first; but after a few minutes' hesitation he went to look for Boynton. He found him alone in one of the small tents. It was dark, but Christie could hear him sobbing like a child.

"Do you and Patsy do the turn to-night, Mr. Boynton?" he said.

Boynton looked up suddenly, and then, seeing who it was, said:

"Yes, Christie; if I never do it again."

Christie stood for a moment in the doorway. He saw the man who had been as good as a father to him with his head buried in his hands and shaking from head to foot like a leaf trembling in the wind.

"Clyde would hardly expect it," he blurted out; "and really, Mr. Boynton, I'm afraid you're not fit."

"Don't you worry, Christie," said Boynton; "I'll be steady enough when the time comes."

But Christie did not think so. He saw the danger of accident or even death for the girl. He started off in pursuit of Patsy. He found her just as she was going into the women's dressing-tent. He recognized her by her long white ulster, and a big hat that shaded her pretty, delicate face. He called to her, and when he came up he saw that she knew nothing of what had happened.

"Patsy," he said, "I'd like very much to do the turn to-night."

"Why?" said Patsy.

Now Christie was usually very prompt with an answer, but it was different to-night as he talked with Patsy. He was very ill at ease, and hesitated some time before he spoke.

"Well," he said, after a long pause, "there's some boys out there in front, and I think I'd like them to see me in my red tights and the spangles, see?"

"Oh, all right," said Patsy; "I don't care." "Do you mean it?" he replied. "Thank you ever so much."

"Your hand's as cold as ice," said the ring-master, as he led Christie out.

"Think so?" said Christie. "Great house, is n't it?"

In a minute he was on the horse's back, and a moment later Boynton was holding him out at arm's-length. Christie saw that the rider was doing the act unconscious of everything about him. The man seemed dazed, and moved mechanically. If the horse had not been so well trained the act must have ended at once in a failure. As it slowed down to a walk Christie gave vent to a long sigh of relief. "That was easy enough," he said to himself; "but I wish I was over those five sticks."

The hurdles were brought out, and the horse started on a slow gallop around the ring. Boynton, who was probably unconscious of what he was doing, or over-anxious to get through the act and be alone away from the awful crowd, suddenly yelled to his horse. Christie, who was standing on the man's shoulders, felt the animal make a sudden start, and just managed to steady himself for the first hurdle.

"One—two—three—four," he counted, as the horse jumped each hurdle. In another second it would all be over. At the exit he saw Patsy standing. She was leaning against the band-stand with her hands stuck deep down in the pockets of her ulster. Then he looked at the man holding the last hurdle. As the horse jumped each stick, the man always lowered it;

but now he was looking away from them, and might not lower it in time. The blood rushed to Christie's head. He felt as if a furnace was raging within him.

"Lower that hurdle, you d—!" The rest of the sentence was lost in the yells of the men and the shrieks of the women. The audience was on its feet. The horse had hit the stick with one of its fore-feet. The man fell uninjured, but the boy was picked up with a deep cut just over his temple.

The ring-master called for any doctors that might be in the audience, and a little group of men followed the two attendants that carried the boy into the big dressing-tent. They laid him on a wooden chest, and covered the little body with the spangled clothes that hung about the tent. When he opened his eyes he saw the three Boyntons standing by his side.

"So you came back, did you?" said Christie.

"Yes, Christie. I hope it's not too late," sobbed Mrs. Boynton.

"It's never too late," he said. "You're never goin' to leave Patsy again though, are you?"

"Never," she said.

"That's good, that's good," said Christie. "But what's the matter with the band? Why ain't it playin'? And the lights, they're all goin' out. Say, please don't leave me alone here when I'm hurt."

The proprietor stood in the background, biting his nails. One of the attendants tiptoed noiselessly across the floor of the tent to his side.

"The audience, Mr. Clyde?" he said.

The proprietor looked up sharply. "The audience be—"

He did not finish the sentence, for he saw the little group about Christie slowly turning their backs on the little rider and moving away.

"I guess you'd better tell 'em it's all over," he said.

## THE BIRD'S SONG, THE SUN, AND THE WIND.

THE bird's song, the sun, and the wind—  
The wind that rushes, the sun that is still,  
The song of the bird that sings alone,  
And wide light washing the lonely hill!

The spring's coming, the buds, and the brooks—  
The brooks that clamor, the buds in the rain,  
The coming of spring, that comes unprayed for,  
And eyes that welcome it not for pain!

*Charles G. D. Roberts.*

GEORGE WARREN LEWIS . 410 .

## THE COFFEE-HOUSE, MAARKEN.

THE COFFEE-HOUSE.

where the burgomaster and the principal men of the locality congregate, it can hold them all, and still give bench-room to the chance stranger.

A high-backed, oaken bench, well polished by use, follows the wall on three sides, leaving space for the high, white-tiled fireplace. The fourth is occupied by a leaden-faced bar, or counter, well garnished with the tall delft jars in blue and white with shining brass tops, wherein is contained the material for the goodly array of clay pipes in the racks overhead. Small, round tables are set before the bench, leaving the center of the room free. The bench itself is well occupied by a line of stolid, substantial-looking, ruminating Hollanders smoking furiously, the gray wreaths of pungent vapor slowly curling upward about the hanging models of vessels, high as to poop and rounded as to bow—models of the time of Van der Decken.

Only occasionally does a mynheer remove his pipe to let fall a sentence epigrammatic in its terseness. Your North Hollander speaks

slowly, and is economical with his words. He neither looks for nor attempts smartness of repartee; does not smile easily; and rarely tells a story, because all the stories are known and worn threadbare by repetition, and he is shy of new ones. If one listens to the talk one finds that it is of the sea. Everything in Maarken belongs to the sea. How can one be interested in crops that are grown in tubs; in farms that number feet instead of acres; in land brought from Amsterdam at that, for Maarken is all sand? Then, again, when one goes abroad in Maarken, one must either walk *over* the water on bridges or sail *upon* it in a boat, and even the housetops are ornamented with bellying nets hung up to dry, and with long masts from which Juvrowe flies a signal of welcome to Hnedrik or Nikolaas on his way home in his blunt-bowed, lee-boarded *tyalk*.

It is in the coffee-house that your talker, your romancer, is discouraged. He is quickly made to understand by means well known to the phlegmatic frequenters that they will have none of him; that he must either observe the proprieties well established there, or go away at once.

In the coffee-house whist is much in vogue—an excellent method of disguising the poverty of conversation, or of excusing the lack of it. So happily

TOWN-HALL.

A PEASANT.

constituted are the players, that with the exception of an occasional grunt of pleasure or dismay, as it so happens, when a card is laid down, and the continuous puffing of pipes manufacturing fragrant fog, the silence is well-nigh unbroken for, I was about to say, hours at a time.

This evening the current was interrupted—excitement reigned; that is to say, as much excitement as could be permitted within the hallowed precincts of the coffee-house. A stranger was present. Enough would it have been had the stranger been a countryman from Sneek, or even from Monnikendam; but lo! this was no common, every-day stranger, actually sitting in the corner by the tile-garnished fireplace, drinking his thin beer and smoking a new clay pipe as stolidly as if he had occupied the spot for a score of years. This bearing of his conferred a dignity upon him in the eyes of the mynheers that they could not conceal. Whist languished, pipes went out and needed relighting, a necessity in itself marvelous and hitherto unheard of. Whispers were heard from the burgomaster's corner. The mynheers slid along the polished bench until they were all in a knot, with their heads together about the burgomaster's.

The whispers became louder; horny palms smote one another; an unheeded pipe fell to the floor, and broke in pieces with a metallic click. The group parted, and it was evident that a crisis had arrived. The burgomaster drew apart in a dignified manner, and approached the stranger. The others also slid their persons along the polished settle in his direction. The burgomaster bowed, ejaculated, "Dag, mynheer," seized the poker, and made shift to stir the lumps of glowing charcoal in the brass box on the hearth.

It was like a scene from a comic opera, with the line of fascinated mynheers in very small skull-caps perched upon their shock heads, bright neckerchiefs fastened with huge gold buttons, coats abbreviated as to tails and tight in the waist, and breeches of indescribable width. There was, however, a trifle more of dignity in the dress of the burgomaster. His was a long-tailed coat of clerical cut, a wide-brimmed felt hat, knee-breeches, and leg-

gings. Still stirring the coals, he seated himself beside the stranger, and looked him critically over from the corner of his eye. The inspection seemed to be satisfactory, for he offered his tobacco-box with a ceremonious bow. The stranger accepted, and bowed in return, and the salutation was repeated by the mynheers on the slippery bench; which formality being at an end, the burgomaster, filling his pipe, ejaculated:

"Van Amerikaa?"

"Van Amerikaa," avowed the stranger.

"Van Amerikaa," triumphantly sounded in chorus the mynheers on the bench. There was a long pause, during which heavy volumes of smoke arose.

"Nord Amerikaa?" asked the burgomaster in a doubtful tone.

"Nord Amerikaa," responded the stranger.

"Nord Amerikaa," sounded the chorus of mynheers, nodding to one another in great enjoyment of the perspicacity of the burgomaster. Another long interval followed, during which the mynheers' allowed the fact to percolate through their gray matter.

"New York?" suddenly called out, in a burst of genius, a fat fellow, with an absurdly thin neck and an emaciated head, who sat at the farthest end of the bench.

The stranger's answer to this brilliant inquiry was breathlessly awaited. Finally, when he had succeeded in lighting his pipe, he nodded. With a sigh of relief the mynheers gravely repeated the nod to one another, and all settled back on the bench.

Here the burgomaster began to shuffle his feet and to blink his eyes. He was evidently formulating an interrogation, but before he could get it in form, from the emaciated head on the end of the bench came in jerks: "New York has got a Brasident—Gleveland, heh? Shoo-fly! I spik Engelsch!" Much to the disappointment of the mynheers, who evidently regarded the speaker as a scholar of the first magnitude, the stranger did not vouchsafe any reply to this piece of information, but

CARD-PLAYERS.

BURGOMASTER.

THE PROCESSION.

drained his beer-mug to the last drop, and set it upon the table *with the lid up*. There is an old and honored custom in Holland which provides that whenever one leaves his mug with the lid up in a public place it is in form for all within reach to deposit their mugs upon his table, and he is forced to pay for their refilling. Such an occasion had not happened in Maarken within the memory of the oldest mynheer in the town, and almost before the American's mug had touched the table the eager mynheers were upon their feet, headed by the dignified burgomaster, mug in hand.

THE LANDLORD.

The stranger, when the situation was explained to him with excited gestures by the landlord, in which the chorus joined, paid for his error in good grace, and once more quietness reigned. With his mug in hand and his eyes fixed upon the glowing charcoal in the brass box, the American began in tolerable Dutch, as if talking to himself: "In New York one sees railroads built in the air, and cars crowded with people rushing over them. In New York buildings thir-

teen stories high are seen, and stairs are seldom used. People are whisked up to their rooms in cars run by steam. In New York cars are run upon the streets not by horses or steam, but by lightning, and all the lamps in the city are lighted at once by one man, who uses no fire or matches, but simply sits in his chair and turns a screw. In New York there is a bridge so high that the masts of tall vessels may pass under it without touching. It is hung upon wires, and railroad-trains pass over it all day and night. In New York"—the burgomaster paused spell-bound in the act of drinking, and slowly set down his mug *with the lid up*. The stranger's eye caught the error, and he banged his mug on the table beside the burgomaster's. The mynheers rose to their feet in an ecstasy of astonishment, indignation, and dismay, and before the stranger's mug had been filled and replaced upon the table the coffee-house was empty, save for the presence of the American and the awe-struck landlord.

GOING HOME.

George Wharton Edwards.

## GLORIA MUNDI.

GIVE us the earth's whole heart but once to know,  
 But once to pierce the secret of the spring,—  
 Give us our fill,—and we at end will go  
 Into the starless night unmurmuring.

Gold lights that beckon down the dusky way,  
 Where loud wheels roll, impetuous, through the night;  
 The lamp-lit leaves; the maddening airs of May;  
 The heady wine of living, dark and bright.

Give us of these, and we are blest, in truth;  
 The wandering foot, the keen, unflagging zest,  
 One with the glorious world's eternal youth,  
 Of all that is, and is not, first and best.

Ah, vain desire, our straitened years to mar!  
 Troubled we turn and listen, unreleased,  
 To music of a revel held afar,  
 Evasive echoes of a distant feast.

Graham R. Tomson.

## RUDGIS AND GRIM.

WITH PICTURES BY E. W. KEMBLE.

“When Freedom from her mountain height,” etc.

GRIM.

ENGRAVED BY T. SCHUSSLER.

THE Rudgis farm was the only one in Lone Ridge Pocket, a secluded nook of the north Georgia mountain-region, and its owner, Eli Rudgis, was, in the *ante-bellum* time, a man of note among the simple and honest people who dwelt beside the little crooked highway leading down the valley of the Pine-log Creek. He owned only one negro, as was often the case with the better class of mountaineers, but, which is not often the case with them, he had neither wife nor children. His slave was his sole companion of the human kind, sharing with certain dogs, pigs, horses, and oxen a rude, democratic distribution of the domestic frowns and favors. As a man this negro was an interesting specimen of the genuine African: short, strongly built, but ill-shapen, with a large head firmly braced by a thick, muscular neck on broad, stooping shoulders; a skin as black as night; small, deep-set eyes; a protruding, resolute jaw; and a nose as flat as the head of an adder. As a slave he was, perhaps, valuable enough in his way; but both as man and thrall he did no discredit to his name, which was Grim. He, too, was a familiar figure along the Pine-log

road, as he drove an old creaking ox-cart to and from the village.

When the war broke out, master and slave had reached the beginning of the downward slope of life, and, having spent many years together in their lonely retreat at the Pocket, had grown to love each other after the surly, taciturn fashion of men who have few thoughts and a meager gift of expression.

Eli Rudgis was tall, slim, cadaverous, slow of movement, and sallow; but he had a will of his own, and plenty of muscle to enforce it withal.

“Grim,” said he one day, “them derved Northerners air a-goin’ ter set ye free.”

The negro looked up from the hickory-bark basket he was mending, and scowled savagely at his master.

“W’at yo’ say, Mars Rudgis?” he presently inquired.

“Them Yankees air a-goin’ ter gi’ ye yer freedom poorty soon.”

Grim’s face took on an expression of dogged determination, his shoulders rose almost to the level of his protruding ears, and his small, wolfish eyes gleamed fiercely.

“Who say dey gwine ter do dat?” he demanded with slow, emphatic enunciation.

“I say hit, an’ w’en I says hit,” began the master; but Grim broke in with:

“Dey cayn’t do nuffin’ wid me. I done made up my min’; dis chil’ cayn’t be fo’ced. Yo’ yah dat, Mars Rudgis?”

Rudgis grinned dryly, and walked away smoking his cob-pipe with the air of a philosopher who bides his time.

The Rudgis cabin was a low, nondescript log structure of three or four rooms and a wide entry, or hall, set in the midst of a thick, luxuriant orchard of peach-, plum-, and apple-trees crowning a small conical foot-hill, which, seen from a little distance, appeared to rest against the rocky breast of a mountain that stood over against the mouth of the Pocket. From the rickety veranda where Rudgis now sought a seat there was a fine view of the little farm, whose angular but rolling patches of tillable land straggled away to the foot-hills on the other side of the Pocket, beyond which the wall of cliffs rose, gray and brown, to a great height.

Recently Eli Rudgis had been thinking a good deal about Grim; for, as the war continued, it grew in his mind that the South was going to lose the fight. He had only recently heard of President Lincoln's emancipation proclamation, and with that far-seeing prudence characteristic of a certain order of provincial intellect he was considering how best to forestall the effect of freedom if it should come, as he feared it would. Grim was his property, valued at about eight hundred dollars in "good money," or in Confederate scrip at, perhaps, two or three thousand dollars, more or less. He shrank from selling the negro, for in his dry, peculiar way he was fond of him; but, on the other hand, he could not consent to lose so much money on the outcome of an issue not of his own making. It can readily be imagined how, with ample leisure for reflection, and with no other problem to share his attention, Rudgis gradually buried himself, so to speak, in this desire to circumvent and nullify emancipation, in so far as it would affect his ownership of Grim, when it should come.

Grim was far more knowing, far better informed, and much more of a philosopher, than his master gave him credit for being. By some means, as occult as reliable, he had kept perfectly abreast of the progress of the great, weltering, thundering, death-dealing tempest of the war, and in his heart he felt the coming day of deliverance, the jubilee of eternal freedom for his race. Incapable, perhaps, of seeing clearly the true aspect of what was probably in store for him, he yet experienced a change of prospect that affected every fiber of his imagination, and opened, so to say, every pore of his sensibility. Naturally wary, suspicious, and quick to observe signs, he had been aware lately that his master was revolving some scheme which in all probability would effect a change in their domestic relations, to the extent, possibly, of severing the tie which for so long had bound together the lord and the thrall of Lone Ridge Pocket.

"He studyin' 'bout er-sellin' me," he soliloquized, as he lingered over his task of basket-mending after Rudgis had gone away, "an' he fink he er-gwine ter fool dis ol' coon. Well, 'fore de Lor', mebbe he will."

"What ye mutterin' thar, Grim?" called the master from his seat on the veranda. "What ye growlin' 'bout, lak er pup over er ham-bone?"

"Nuffin', sah; I jes tryin' fo' ter ketch dat chune w'at I be'n er-l'armin'."

Then, to clinch the false statement, Grim began humming:

"De coon he hab er eejit wife,  
Hoe yo' co'n, honey,

De coon he hab er eejit wife,  
An' she nebber comb her hah in 'er life,  
Keep er-hoein' yo' co'n, honey.

"An' de coon say: 'I knows w'at I 'll do,'  
Hoe yo' co'n, honey,  
An' he wife she squall out, 'I does too!'  
An' she snatch 'im poorty nigh in two,  
Keep er-hoein' yo' co'n, honey.

"So dat coon he allus recollect,  
Hoe yo' co'n, honey,  
Ef he talk too loud he mus' expect  
She scratch he eyes an' wring he neck,  
Keep er-hoein' yo' co'n, honey!"

Rudgis listened stoically enough, so far as facial expression went; but when the low, softly melodious song was done, he shook his head, and smiled aridly.

"Got more sense 'an er Philadelpy lar-yer," he muttered under his breath, "an' he's got some undertakin' inter that noggin er his'n. S'pect I hev ter do somethin' er 'nother wi' him, er he 's er-goin' ter git the best o' me."

He drew away at his wheezing pipe, leaning his chin, thinly fringed with grizzled beard, in his left hand, and propping that arm with his knee. His typical mountain face wore a puzzled, half-worried, half-amused expression.

"Dern's black pictur'," he continued inaudibly, though his lips moved; "he air a-considerin' freedom right now."

"Whi' man tuk me fer er fool,  
Hoe yo' co'n, honey,  
Wo'k me like er yaller mule,  
An' never gi' me time ter cool,  
Keep er-hoein' yo' co'n, honey,"

hummed Grim in that tender falsetto of his. There was a haze in the air, a Maytime shimmer over the Pocket and up the terraced slopes of the mountains. Suddenly a heavy booming, like distant thunder, tumbled as if in long, throbbing waves across the peaks, and fell into the little drowsy cove.

"W'at dat, Mars Rudgis? 'Fore de Lor'! w'at dat?" cried the negro, leaping to his feet, and staring stupidly, his great mouth open, his long arms akimbo.

Eli Rudgis took his pipe-stem from his mouth, and sat in a harkening attitude. "Hit's thet air war er-comin'," he presently said, and resumed his smoking and reflections.

"De good Lor', Mars Rudgis, w'at we gwine ter do?" stammered Grim, his heavy countenance growing strangely ashen over its corrugated blackness.

"Shet erp, an' mend that there basket," growled the master. "Goin' ter mek ye wo'k like the devil er-beatin' tan-bark while I kin;

fer thet 's yer frien's er-comin' ter free ye, Grim, sure 's shootin'."

The African bowed his head over his light task, and remained thoughtfully silent, while the dull pounding in the far distance increased to an incessant roar, vague, wavering, suggestive, awful.

Rudgis thought little of the wider significance accompanying that slowly rolling tempest of destruction; his mental vision was narrowed to the compass of the one subject which lately had demanded all his powers of consideration. Was it possible for him to hold Grim as his slave despite the proclamation of emancipation, and notwithstanding the triumph of the Federal armies?

"Ef I try ter take 'im down the country ter sell 'im, they 'll conscrip' me inter the war," he argued to himself, "an' ef I stays yer thet 'fernal Yankees 'll set 'im free. Seem lak it air pow'ful close rubbin', an' dern ef I know what ter do! I air kind o' 'twixt the skillet an' the coals."

Day after day he sat smoking and cogitating, while Grim pattered at this or that bit of labor. He had an unconquerable aversion to going into the army, a thing he had avoided, partly by reason of his age and partly by one personal shift or another, after the exigencies of the Confederacy had led to the conscription of "able-bodied men" regardless of age. He felt that things were growing to desperate straits in the low country, and he feared to show himself outside his mountain fastness lest a conscript officer might nab him and send him to the front. Not that he was a coward; but in the high, dry atmosphere of the hill-country there lingered a sweet and inextinguishable waft of loyalty to the old flag, which touched the minds of many mountaineers with a vague sense of the enormity of rebellion against the government of Washington and Jackson. And yet they were Southerners, good fighters, Yankee-haters, and clung to the right of property in their negroes with a tenacity as tough as the sinews of their hardy limbs. They were, indeed, far more stubborn in this last regard than any of the great slave-owners of the low country, owing, no doubt, to their narrow, provincial notions of personal independence, which felt no need for the aid or the interference of the law in their private concerns.

Grim was not a typical slave, but he was a legitimate instance of the slavery known in the secluded region of the Southern mountain-country. He was as free, in all but name, as were most illiterate laborers of that day, barring that his skin and the Southern traditions set him on a plane far below, and quite detached from, that of the lowest white men. He had no bonds that galled him personally; plenty to eat, just enough work to keep him robust,

a good bed, sufficient clothing, and unlimited tobacco — what more could he want?

His master, however, observed that he was doing a great deal of thinking; that lately he was busying his mind with some absorbing problem, and from certain signs and indications the fact appeared plain that Grim was making ready to meet the day of freedom. Rudgis saw this with a dull, deep-seated sentimental pang mixed with anger and resentment. Years of companionship in that lonely place had engendered a fondness for his slave of which he was not fully aware, and out of which was now issuing a sort of bewilderment of mind and soul. Would Grim indeed forsake him, desert him to go away to try the doubtful chances of a new order of things? This question was supplemented by another based on a different stratum of human selfishness. Rudgis, like all mountain-men, had a narrow eye to profit and loss. The money represented by Grim as his slave possessed a powerful influence; it was the larger part of his fortune.

Grim, on his part, watched his master as the tide of the war flowed on through the mountain-gaps far to the east of the Pocket; his calculations were simpler and more directly personal than those of his master. Of course things could not remain in this situation very long. Grim was the first to speak straight to the subject.

"Mars Rudgis," said he one day, "yo' be'n 'siderin' erbout sellin' me."

This direct accusation took the master un-awares.

"Wha-wha-what 's that air ye air er-sayin', ye ol' whelp?" he spluttered, almost dropping his pipe.

"Yo' be'n er-finkin' 'at I 's gittin' close onter de freedom line, an' ye s'pose yo' 'd better git w'at ye kin fo' me, yah-yah-yah-ee-oorp!" and the black rascal broke forth with a mighty guffaw, bending himself almost double, and slapping his hands together vigorously. "But yo' 's 'feared dey git ye an' mek yo' tote er gun, an' 'at yo' 'd git de stuffin' shot outen yo' ef yo' try take me down de country, yah-yah-yah-ee-ee-oorp!"

"Shet erp! What ye mean? Stop thet air sq'allin', er I 'll —"

"Yah-yah-yah-ee-eeep! I done cotch onter yo' ca'c'lation, Mars Rudgis, 'fo' de Lor' I has, oh! Yah-yah-yah-yah-ha-eeep! An' yo' fink I 's er eejit all dis time, yah-yah-yah! Oh gi' 'long, Mars Rudgis, yo' cayn't fool dis chicken, yah-ha-yah-ha-ha-ha-ee-er-poo!"

Rudgis tried several times to stop this flow of accusative mirth, but at last, quite confused, he stood tall and gaunt, with a sheepish grin on his dry, wrinkled face, gazing at the writhing negro as he almost screamed out his sententious but fluent revelation.

"I done be'n er-watchin' yo' like er sparrer-hawk watchin' er peewee, Mars Rudgis, an' I say ter myself: 'Jes see 'im er-figerin' how much I 's wo'f, an' how much he gwine ter lose w'en I goes free.' An' I done be'n jes er-bustin' over it all dis time, yah-yah-yah-ee-ee!"

"Grim," said Rudgis, presently, with slow, emphatic expression, "I air er-goin' 'mejitly ter give ye one whirpin' 'at ye 'll ricomember es long es they 's breath in yer scurvy ol' body!"

They were standing on the veranda at the time. Rudgis turned into the entry, and immediately came out with a ramrod in his hand.

"Now fer yer sass ye air er-goin' ter ketch hit," he said, in that cold, rasping tone that means so much. "Stan' erp yer an' take yer med'cine."

Grim went down on his knees and began to beg; his mirth had vanished; he was trembling violently. Rudgis never had whipped him.

"Fo' de Lor' sake, Mars Eli, don' w'irp de po' ol' chil'! I jes funnin', Mars Rudgis; I jes want ter see w'at yo' gwine say. I—"

At that moment there was a great clatter of iron-shod hoofs at the little yard gate; the next, three or four horses bounded over the low fence and dashed up to the veranda.

"Please, Mars Rudgis, don' w'irp me! I did n' mean no harm, Mars Rudgis, 'deed I did n'! Oh, fo' de Lor' sake!"

"Ha! there! stop that!" commanded a loud, positive voice.

Rudgis had already looked that way. He saw some mounted soldiers, wearing blue uniforms and bearing bright guns, glaring at him.

"O, Mars Rudgis, I never gwine do so no mo', don' w'irp me! don' w'irp me!" continued Grim, paying no heed to the soldiers. "Le' me off dis yer time, fo' de goo' Lor' sake!"

"If you strike that negro one blow, I 'll shoot a hole through you quicker than lightning!" roared one of the men, who appeared to be an officer, at the same time leveling his pistol.

Rudgis dropped the ramrod as if he had been suddenly paralyzed. Grim sprang to his feet with the agility of a black cat.

"What does this mean?" demanded the officer, showing a gleam of anger in his eyes, his voice indicating no parleying mood.

Rudgis stood there, pale, stolid, silent, his mouth open, his arms akimbo.

"Lor', sah, we 's jes er-foolin'," said Grim, seeing that his master could not find a word to say. "We 's er-playin' hoky-poky."

The officer leaned over his saddle-bow, and looked from one to the other of the culprits.

"Yes, sah; it wa' bony-hokus 'at we 's er-playin', 'zac'ly dat, sah," continued Grim.

"Playing what?" grimly inquired the officer.

"Rokus-pokus, sah."

"Youlying old scamp," cried the officer, glaring at him, "you 're trying to deceive me!"

"Ax Mars Rudgis, now; ax him, sah."

"Humph!" and the Federal turned to the master. "What do you say, sir?"

"Tell 'im, Mars Rudgis; tell 'im 'bout w'at we 's er-playin'," pleaded Grim.

Rudgis moved his lips as if to speak, but they were dry and made no sound. He licked them with his furred, feverish tongue. Never before had he been so thoroughly frightened.

"IF YOU STRIKE THAT NEGRO ONE BLOW."

"Are you dumb?" stormed the officer, again handling his weapon. "Can't you speak?"

"Hit were hoky-poky," gasped Rudgis.

"Dah, now! Dah, now! Mebbe yo' 's sat'sfied, sah. W'a' d I tol' yo'?" cried Grim, wagging his head and gesticulating. "We 's jes er-playin' dat leetle game."

The officer wanted some information about a road over the mountain, so he made Grim saddle a mule and go with him to show the way. As he rode off he called back to Rudgis:

"This man 's as free as you are, and he need n't come back if he don't want to."

When they were quite gone, and the last sound of their horses' feet had died away down in the stragglng fringe of trees at the foot of the hill, Rudgis picked up his ramrod and looked at it quizzically, as if he expected it to speak. Slowly his face relaxed, and a

queer smile drew it into leathery wrinkles.

"Hit were hoky-poky, by gum!" he muttered. "The dern ole scamp!"

Presently he filled his pipe, and lighted it, grinning all the while, and saying:

"The trifin' ol' rooster he hed half er dozen dif'ent names fer it; but hit were hoky-poky jes the same. The dern old coon!"

THE day passed, likewise the night; but Grim did not return. A week, a month, six months; no Grim, no mule. Sherman had swept through Georgia, and on up through the Carolinas; Johnston and Lee had surrendered. Peace had fallen like a vast silence after the awful din of war. The worn and weary soldiers of the South were straggling back to their long-neglected homes to resume as best they could the broken threads of peaceful lives.

Rudgis missed Grim more as a companion than as a slave. He mourned for him, in a way, recalling his peculiarities, and musing over that one superb stroke of wit by which, perhaps, his life had been saved. Never did he fail, at the end of such a reverie, to repeat, more sadly and tenderly each time, "Hit were hoky-poky, blame his ol' hide!" The humor of this verbal reference was invariably indicated by a peculiar rising inflection in pronouncing *were*, by which he meant to accentuate lovingly Grim's prompt prevarication.

Spring had come again to the mountains, bringing its gush of greenery, its mellow sunshine, and its riotous birds. Into the Pocket blew a breeze soft, fragrant, dream-burdened, eddying like a river of sweets around the lonely, embowered cabin.

Early one morning Rudgis was smoking in his accustomed seat on the veranda. In his shirt-sleeves, bareheaded and barefooted, his cotton shirt open wide at throat and bosom, he looked like a bronze statue of Emaciation, so collapsed, wrinkled, and sear was he. His Roman nose was the only vigorous feature of his unkempt and retrospective face.

The sound of a mule's feet trotting up the little stony road did not attract his curiosity, albeit few riders passed that way; but when Grim came suddenly in sight, it was an apparition that relaxed every fiber of Rudgis's frame. He dropped lower in the old chair, his arms fell limp, and his mouth opened wide, letting fall the cob-pipe. He stared helplessly.

"Yah I is, Mars Rudgis; got back at las'. How ye do, Mars Rudgis?"

ENGRAVED BY J. F. JUNGLING.

"PRESENTLY HE FILLED HIS PIPE, AND LIGHTED IT."

There was the ring of genuine delight in the negro's voice — the timbre of loyal sentiment too sweet for expression in written language. He slid from the mule's back, — not the same mule that he had ridden away, but an older and poorer one, — and scrambled through the lop-sided gate.

"Well, by dad!" was all Rudgis could say. "Well, by dad!"

"Tol' yo' dey could n't sot dis niggah free, did n' I?" cried Grim, as he made a dive for both of his old master's hands. "I 's come back ter 'long ter yo' same lak I allus did. Yah sah; yah sah."

Rudgis arose slowly from his seat and straightened up his long, lean form so that he towered above the short, sturdy negro. He looked down at him in silence for some moments, his face twitching strangely. Slowly the old-time expression began to appear around his mouth and in his eyes. With a quick step he went into the house, and returned almost instantly, bearing a ramrod in his hand.

"Well, Grim," he said, with peculiar emphasis, "ef ye air still my prop'ty, an' ye don't objec', s'posin' we jes finish up that air leetle game er hoky-poky what we was er-playin' w'en them Yankees kem an' bothered us."

## WHAT THE GOVERNMENT IS DOING FOR THE FARMER.

HE farmer was never before so prominent a figure in the United States. This fact is all the more noteworthy when considered in connection with the decreasing proportion of our population living in

the country, and with the growing importance of our city industries as compared with agriculture. The explanation is to be found in the fact that the United States has just reached a point of marked change in agricultural conditions.

For more than a century the pioneer farmer has been working his way, year by year, toward the West. Beginning on the Atlantic coast, he cut the forests of New England, exhausted the fair fields of Virginia, tried and passed by the fertile valleys of central New York, stopped for a time in the Ohio Valley, completed the conquest of Kansas, quickly took possession of Nebraska and Montana, and now has come face to face with the agriculture of the Pacific Slope. During all this time he has planted his seed and gathered his crops without giving a thought to the destruction his methods were bringing upon the fertility of the soil. The exhaustion of the soil was a matter of no serious import, for to him its only meaning was an easy move to a new location. We of to-day see the birth of agriculture in the United States. The farming of the past was land-skimming; the farming of the future must be land-culture. Suddenly the old pioneer farmer has found the play played out, and the present wide-spread interest in the farmer is the manifestation of the fact that our agriculture—still the greatest of our industries—is under the necessity of accommodating itself to new conditions.

So long as the supply of virgin land was sufficient, agriculture asked few favors. The Eastern and Middle States have long been studying methods for preserving the soil, diversification of products, and means of protection from plant diseases, insect pests, and other enemies. But it is only recently that crop disasters or low prices, affecting the great staple-producing regions of the West, have brought the farming population to an agreement in the demand for help. This demand has called men of science to the study of the principles that underlie the

right practice of agriculture, and has asked the lawmakers for such protection and help as it is in their power to afford.

It is the purpose of this article to state very briefly the principal points of some of the more important legislation bearing upon agricultural interests. Space, however, makes it necessary to leave a large and important part of the field uncovered. By special exception, railroad legislation is treated in another article. Nor will any attempt be made to trace the effects of legislation, which, though of great influence on the welfare of the farmer, yet touches his interests only in common with those of others. This exception will throw out any consideration of the general effect of the tariff on the tiller of the soil. The specific protection meant for his direct benefit will be noticed, but it will not be possible to touch the still more important and more difficult consideration of the net results of the McKinley Act, arising from giving him control of the home market with increased prices for some of his products, and at the same time requiring him to pay increased prices for some of the articles which he consumes. Another important class of laws is composed of those relating to banking and money. The changes which are asked in these lines deserve the respectful and careful consideration both of the people at large and of Congress, but they can not be considered here. Another tempting topic which the writer must not discuss is the fairness to the farmer of the laws which distribute the burdens of national, State, and local taxation. Another body of laws of the greatest interest is State legislation; but all that can be done in this article is to make mention of some of the more interesting subjects which it covers. Prominent among these at present are the making and the care of country roads; and if it be true, as stated, that it often costs more to haul grain ten miles by wagon to the railroad than to carry it by rail and steamer from the interior of the United States to Liverpool, it will be seen that this subject deserves even more attention than it is now receiving. Other subjects are the control of the fertilizer trade, the inspection of milk, butter, meats, and other products, the liabilities of owners of stray stock, the necessity of fences, the regulation of the slaughtering of animals, the duties and privileges of grain-elevators and other public

warehouses, the work of commissioners of agriculture and of boards of agriculture, farmers' institutes, district libraries, and the like.

It is, then, the object of this article to state very briefly the essential features of the more important recent acts of Congress bearing upon the development of agricultural interests in the United States.

#### OLEOMARGARIN.

IN 1886, at the solicitation of the dairy interests, Congress passed a law, which the President approved August 2, defining butter and imposing a tax upon and regulating the manufacture, sale, importation, and exportation of oleomargarin.

In 1867 a French chemist, Mège-Mouries, surmising that the presence of butter in milk was due to the absorption of fat contained in the animal tissues, began experiments on the separation of the oils of animal fat. He succeeded in separating fatty matter into stearin and oleomargarin, the second of which he used for butter-making. His discovery became known, and when introduced into the United States, led to the development of a large industry for the manufacture of artificial butter from beef fat. This fat is composed chiefly of three oils or fats—stearin, olein, and palmatin. The second and third are the largest constituents of butter. Stearin appears, but in very much reduced proportion. The manufacture is based upon the circumstance that the three fats melt at different temperatures, olein requiring the least heat and stearin the most. The animal fat is first carefully washed in cold water and cleaned from all portions of flesh and from other impurities. It is then heated until melted. The mixture of oils obtained is allowed to cool until some of the palmatin and a large part of the stearin become solid. The mixture is then subjected

to heavy hydraulic pressure. The fluid portion extracted is known as oleomargarin. When churned with a certain proportion of fresh milk a butter is produced which mixes with it, and the buttermilk imparts a flavor of fresh butter to the mass, making an imitation so perfect that it can scarcely be distinguished by taste from fresh butter. There seems to be little doubt that the product of this process, when made from carefully selected fats, by the best method, is pure, sweet, wholesome, and more palatable than some butters.

The act above referred to, popularly known as the Oleomargarin Act, with the exception of section 1, which contains a definition of butter, is devoted entirely to oleomargarin. It lays a special tax of \$600 upon manufacturers, of \$480 upon wholesale dealers, and of \$48 upon retail dealers. A stamp tax of two cents a pound, to be paid by the manufacturer, is assessed upon every pound or upon every package containing a fraction of a pound. It provides for exportation free of tax, and subjects imports to an internal revenue tax of 15 cents per pound in addition to any customs duty. Each package is to be marked, stamped, and branded as prescribed by the Commissioner of Internal Revenue. Severe penalties are imposed for manufacturing or selling without paying the proper tax, for buying from those who have not paid the proper tax, and for failing properly to label packages. The law, as introduced in Congress, was doubtless intended to prohibit the manufacture; but, as passed, it is a protective measure. It protects the butter-maker not, as originally intended, by imposing a tax sufficiently great to deprive oleomargarin of the advantage of cheapness, but by freeing butter from the competition of oleomargarin under the name of butter. It protects consumers from the imposition of imitation butter for real. The reports of the Commissioner of Internal Revenue show the following figures:

FOR THE FISCAL YEAR ENDING —	INTERNAL REVENUE RECEIPTS.		NUMBER POUNDS PRODUCED.		PERSONS ENGAGED IN TRADE, AS —		
	TOTAL.	PER MONTH.	TOTAL.	PER MONTH.	MANUF- TURERS.	WHOLESALE DEALERS.	RETAILERS.
June 30, 1887*	\$723,948	\$90,493	21,513,537	2,689,192	37 †	267 †	3416 †

\* For 8 months from November 1, 1886, when the law went into operation. † For the "special tax year" ending April 30.

† The cheapness of butter and stringent State laws account for the decrease.

§ For 14 months ending June 30, 1891. The law of Oct., 1891, made the "special tax year" end June 30, to conform with fiscal year.

Those who wished to prohibit the manufacture and sale have been disappointed, for the oleomargarin industry has actually increased since the passage of the act. It has not, however, failed in noteworthy results. It has helped to raise the price of butter, especially that of good butter. Further, by confining the oleomargarin competition to the poorer grades of butter, it has doubtless caused improvement in these grades. Again, by preventing oleomargarin from masquerading as a more expensive article, it has kept the price down, greatly to the advantage of consumers. And, lastly, by compelling oleomargarin to be sold under its own name, it has relieved that product from the reproach of being a fraudulent article and has given it an honorable position in commerce as a legitimate means of utilizing waste products, and as a cheap, wholesome substitute for an expensive necessity.

#### THE FARMER AND THE WEATHER.

THE weather service of the United States was until recently under the charge of the War Department, and its conduct was a part of the work of the Signal Office. Under this management it devoted itself chiefly to the interests of commerce, though some attempts were made to help the farmer by warning him of frosts and floods, and by studies in lines in which he is especially interested. By an act approved October 1, 1890, the weather service was transferred from the War Department to the Department of Agriculture, of which it became a bureau, and it is expected that every effort will now be made to increase the value of the service to agriculture. The development of the work of this bureau will be of great interest to the farmer. In the past, good reasons have rendered it impossible to make the weather service of very great value to him. In the main its work has been the preparation of the familiar predictions, which have been made for large areas. At present the areas selected are single States. The predictions are made by an officer in Washington to whom observations are reported from a large number of stations situated in various parts of the country. He glances over these reports, noting the places where rain has fallen, and the network of temperatures and barometric pressure; sees how the conditions have been changing since the last predictions were made; and, perhaps with scarcely time to weigh the reasons for his conclusions, makes up his predictions in regard to the weather of the immediate future. He can give but a very small amount of time — perhaps two minutes — to each State. Any decrease in the size of the districts would, by increasing their number, make shorter the time to be devoted to each.

Moreover, an increase in the number of the details to be considered, such as would result from making the districts very much smaller than the States, would greatly augment the difficulty of making any predictions at all. It will be seen that it is impossible for one observer at Washington to make local predictions.

The farmer, however, cares very little to know that rain is to fall in his State or that a frost is likely to occur within three or four hundred miles of him. He wants to be warned of the frost and the summer downpour that now find him unprepared. But in order to make such predictions as his needs require, it is necessary to take local conditions into consideration. A lake, a river-valley, or a forest may affect the weather of adjacent regions. Mountains or hills quite insignificant in the calculations of the Washington prophet will sometimes determine the weather of many farms. If these influences are to be considered, the work of forecasting the weather must be divided, and, in addition to the general predictions from Washington, we must have local predictions prepared by officers in charge of small districts. Such officers have already been appointed by the Secretary of Agriculture, and their number will doubtless be increased when the usefulness of their work is shown. This, however, can not be fully demonstrated until, by the cheapening of telegraph and telephone service, and by the extension of free mail delivery, effective means are found for carrying the predictions to the farmer in time for his use. The present work of the local observers is of service in perfecting their methods, and their forecasts are of great usefulness to the farmers who can be reached; but their full value can never be realized until it is possible to put them promptly into the hands of all the farmers who can use them.

It is also to be expected that the Weather Bureau will undertake the study of those problems which lie in the common domain of meteorology and agriculture. Thus it will doubtless make systematic studies of the climate, which is almost if not quite as important to the farmer as the soil which he cultivates; for it is the climate more than the soil which fits a given region for particular crops. We speak of the peach land of New Jersey and Delaware, but it would be nearer the fact to speak of the peach climate. It is chiefly climate that fits Florida and California for the orange, the North for corn and wheat, and the South for cotton and sugar-cane. In this line the Weather Bureau can be of great service to the farmer, and it need not wait for improvements in the facilities for communication, for climate is permanent, and there will be no difficulty in presenting results of its study in time. Very little work of this kind has yet been done,

but the following quotation from an article by the present chief of the Weather Bureau, written before his appointment, will indicate some of the possibilities :

The State services have in several cases published climatic studies of their own States which are useful, although they have not exhausted even the material on hand. They are in all cases to be looked on as provisional, mere sketches and outlines, to be followed by more complete studies. There are also many individual problems which have been studied with more care. Professor Chickering has called attention to the warm band existing half-way up the Alleghanies. Mr. Alexander has found a cold island in southeastern Michigan. Mr. Curtis has made a careful study of the hot winds of the plains. More complete are the studies made by Dr. Waldo on the distribution of average wind velocities over the States; by Professor Davis and others on the sea breezes of the Massachusetts coast; and by Professor T. Russell on our cold waves. These are all of high importance to the farmer, but the number of them is so small that they hardly do more than serve as specimens of what can and ought to be done for him.

This work will doubtless be entered upon at once, and we may confidently look forward to the time when we shall have a complete climatology for each region of our country. From this the farmer may learn the danger of torrential rains or cloud-bursts, the amount of dew to be expected, the average temperature and the extremes of variation, the frequency and amount of rain, danger of droughts, distribution of snow, amount of sunshine, and the like. These data will go a long way toward indicating the possibilities of profitable culture in any region.

There are other important problems which the bureau will study or which it will perhaps assist the agricultural experiment stations in studying. Among these are, for instance, the meteorological conditions most favorable to the growth of individual plants. It has been found that the cotton-plant requires in the earlier part of its growth plenty of warmth and moisture to develop stem and foliage, while in the later period of growth less moisture is desirable in order to favor full and early development of seed and lint. The meteorological conditions of South Carolina are generally favorable, but the right cultivation of the soil is necessary. Of late years the improvements in the regulation of the moisture by the management of the soil are noteworthy. Sea-island cotton is famous for its quality, and brings a high price, yet some years ago it was thought that the culture of this cotton must be abandoned even on the sea islands, largely because its season of growth, which was so long as to render it liable to be caught by frosts, made the crop very uncertain. Improved methods of culture have, however,

materially hastened the maturity of the plant and brought it well within the length of the season. Similar determinations of meteorological requirements should be made for other staple crops.

Studies should also be made of the way in which plants are affected by removal from one climate to another. We know that an apple which is successful in New York may be an entire failure in Virginia, but we know little of the laws which govern the adaptability of plants to climates. Still other problems are connected with forests, soils, the movement of water in the soil, and the effect of climatic conditions on insect and other pests.

It is easy to see that when specialists turn their attention to this field of work, as yet almost unexplored, many opportunities will present themselves for investigations of great moment to the farmer, and it is not improbable that the act which placed the weather service in charge of the Department of Agriculture may some day come to be regarded as one of the most important originating in the eventful Fifty-First Congress.

#### A NEW SUGAR INDUSTRY.

THE act making appropriation for the United States Department of Agriculture for the fiscal year beginning July 1, 1891, contains the following provision :

Any manufacturer of sugar from sorghum may remove from distillery warehouses to factories used solely for the manufacture of such sugar distilled spirits in bond free of tax, to be used solely in such manufacture; all distilled spirits when so used may be recovered by redistillation.

For a number of years sugar-making experiments with sorghum have been conducted by the Department of Agriculture. Sorghum, sometimes called Chinese sugar-cane, is a cane-like grass, having the general appearance, stature, and habit of broom-corn and the taller varieties of maize, but more slender than the latter and bearing no ears. It contains an amount of sugar which many years ago caused it to be regarded as likely to become one of the important sources of our sugar supply, but till recently this expectation has not been realized; for although a ton of sorghum contains 200 or more pounds of sugar, but 80 pounds could be crystallized out of the concentrated syrup, or molasses. To ascertain the cause of this fact, the Department made investigations which led to the discovery that the substances which prevented the crystallization of the sugar were chiefly gums, which could be entirely taken out by the addition of alcohol to the juice. Alcohol causes the gums to collect and settle, so that

when the juice is filtered or strained they can be pressed into a hard mass on the filter-cloths, and easily removed. This method of treatment increased the yield of crystallized sugar from 80 to 160 pounds per ton of cane. Studies were then instituted looking to the recovery of the alcohol, with the object of using it again and again. Experiments conducted on a laboratory scale showed that the alcohol, after having been used, might be recovered by distillation with a loss of less than 5 per cent., and often of not more than 1 per cent., and that the gums themselves might be fermented and made a source of the alcohol used in the process. The only difficulty in the way of using this process was the cost of the large amount of alcohol needed. This did not result from the expense of making the alcohol, which is slight, but from the heavy internal revenue taxes.

The legislation referred to above was intended to remove these taxes and to make the newly discovered process applicable to the practical manufacture of sugar; and it is reasonable to expect that it will at an early date lead to the establishment of a new sugar industry. This will belong almost entirely to the United States, for the sorghum can not be grown successfully north of us, nor extensively south of us. The growing of sorghum will not, like the cultivation of sugar-cane, be confined to a small district and to a small number of great planters, but will be profitable in the enormous semi-arid region, including the central part of southern Kansas, Oklahoma, and a large part of Texas.

During the last summer and fall experiments have been made on an extensive scale to test the value of this process from a commercial standpoint, and a very important development is the fact that the sugar made is unusually pure. The refining of sugar is simply a process of cleaning or washing, by which impurities adhering to the crystals are removed. With cane-sugar this usually results in raising the percentage of pure sugar from a figure ranging between 90 and 95 before refining to 99.8 per cent. after refining. The raw product of the alcohol process is already about 95 per cent. pure, and will serve for many purposes as it is. This will make it possible for the producer of sorghum sugar to put a large part of his product upon the market without refining, will save the expense of that process, enable the producer and consumer to deal directly with each other, and by reducing the power of the refiners will decrease the danger of sugar trusts.

#### INSPECTION OF LIVE STOCK AND MEATS.

FOR many years our exports of live stock and meat products have been very much restricted by hostile regulations in foreign coun-

tries. The reason assigned for these regulations was the absence of any United States government inspection of live stock and meat products to guarantee them free from disease. Two acts of Congress, one approved August 30, 1890, and the other March 3, 1891, authorize the Secretary of Agriculture to inspect animals and meats intended for export or for interstate trade. In compliance with the law he has established, through the Bureau of Animal Industry, an inspection of live stock for export and an inspection of meats.

The inspection of live stock is intended to detect all animals that are diseased or infected with disease, and to prevent stock from becoming diseased in transport. The veterinary inspection of neat cattle and sheep to be exported to Great Britain, Ireland, and the continent of Europe is made at a number of interior cities and at seaports from which stock are shipped. The cattle inspected at interior cities, when found free from disease and from exposure to contagion, are tagged and shipped to the port of export, where they are again inspected. Railroad companies are required to furnish clean and disinfected cars. Persons who ship live stock must give the name of the place from which the animals come and the name of the feeder, to enable the bureau to trace diseases to their origin. The inspector at the interior city, after passing cattle and tagging them, forwards to the veterinary inspector in charge of the port of export for which they are destined the tag numbers and a description of the cars in which the animals are shipped. At the port the animals are unloaded from the cars at the wharves, whenever possible; and when it is necessary to transport them to ocean steamers by means of boats, these must be cleaned and thoroughly disinfected, and must not receive more cattle or sheep than can be carried comfortably. No vessel with cattle or sheep for Great Britain, Ireland, or the continent of Europe can receive clearance papers until the veterinary inspector certifies to the collector of the port that the animals have been duly inspected, and that the law has been fully complied with.

As Great Britain has insisted upon the existence of contagious pleuropneumonia in American cattle when the United States Department of Agriculture claimed that infection did not exist, the Secretary of Agriculture, through the State Department, recently obtained permission from the British government for American veterinarians to participate with the British officers in inspecting American cattle landed at British ports. In August, 1890, three American inspectors were sent to England. Up to September 19, 1891, they examined 374,000 head of cattle with the most gratifying results. The English officers alleged contagious pleuro-

pneumonia in only three cases, and in these cases the judgment of the American inspectors, who disputed the English diagnosis, was confirmed by the highest English veterinary authorities.

The Department also makes inspection of meats upon application of the proprietors of slaughter-houses or packing-houses. An inspector is appointed for each establishment. He must be given full and free access at all times to all parts of the building or buildings used for the slaughter of animals and the conversion of their carcasses into food products. He inspects all animals in the pens, allowing none to pass to the slaughter-room until inspected, and also makes a post-mortem examination. Any animal found to be diseased is condemned, and its owner must remove it from the premises, and dispose of it as required by the laws of the State. An owner who wilfully causes or permits any diseased animal to remain upon his premises beyond the time allowed for its removal forfeits the privilege of inspection, and is refused certificates for his product. Carcasses of dressed beef are marked with a numbered tag, a record of which is kept in the Department at Washington. Each package of food products made from the carcasses of the inspected animals is carefully marked with a label, which must bear at least the Department number of the establishment and the statement that the product has been examined. A copy of this label is filed in the Department at Washington, and becomes the mark of identification. In addition it is required that each package shipped shall have printed upon it the Department number of the establishment, the location of the factory, the number of pieces or pounds contained, the trade-mark, and in large letters the words "For Export" or "Interstate Trade," and shall bear a Department of Agriculture stamp. For each consignment of carcasses or their food products exported to foreign countries, the Department gives a certificate stating the number of the factory, the name of its owner, the date of inspection, the name of the consignee, the country to which the articles are to be exported, and the numbers of the stamps attached to the articles. The certificate is in triplicate, one copy being delivered to the consignor, one attached to the invoice, and one filed in the Department of Agriculture.

An important part of the regulations for meat inspection is the provision for a microscopic examination of hogs at the time of slaughter in order to detect any infested with the animal parasite called *Trichina spiralis*. This parasite is a small worm found chiefly in hogs and rats and occasionally in other animals that eat animal food. In Germany it is believed to gain entrance to swine through rats

that they consume. How it gains entrance to American swine is not known. The worms when eaten pass into the intestines of the host animal, where they multiply, each female giving rise to about 1800 offspring. The young pass through the walls of the intestines, and wander through the body until they reach the muscular tissue. Muscles, when divided into their last component parts, consist of long, slender bodies made up of a case and inclosed matter. It is upon this matter that the worms prey. They seldom prove fatal to swine, but when they attack the breathing and swallowing muscles of man in sufficiently large numbers, death quickly ensues. Cooking that causes pork to become heated in all its parts to a high temperature for a half-hour or more destroys the worms, and renders even highly infected meat quite harmless. To thorough cooking is largely due the fact that this parasite has caused comparatively few deaths in this country. But in countries like Germany, in which large quantities of pork are eaten nearly or quite raw, the danger is very much increased. In European countries, and especially in Germany, inspection has been made by the Government for many years, and they have objected to receiving American pork, which until very recently has been subject to no inspection whatever.

When the slaughtered hog is passed into the cooling-room, three samples are cut from the body, one from the pillar of the diaphragm, one from the tenderloin, and one from the shoulder. These are marked, placed in self-locking tin boxes, and sent to the microscopist. He or an assistant takes from each sample three small portions, making nine in all for each carcass. These are flattened out between two glass plates and subjected to examination under the microscope. The worms, if present, are easily discovered coiled in a spiral and inclosed in a cyst, or sack. Samples that are condemned by an assistant microscopist as containing trichinæ are again viewed by the chief microscopist. All carcasses that are found to be infested are removed from the premises by the proprietor, and disposed of as the State law requires. Up to the present time proprietors, according to agreement with the Department, have sent condemned animals and meat to the rendering-tank. The Department has, however, no legal authority to compel them to take this course, as the supervision of local markets is left to local authorities.

The cost of the inspection is borne by the Government. The Secretary of Agriculture, in his report for 1891, stated that the inspection of live stock for export had cost, for the ten months during which it had been in operation, \$8500 per month, and that the meat inspection

when it had been in operation three months had cost about  $3\frac{1}{4}$  cents per head for each animal inspected. It is believed that experience will reduce the cost to 3 cents. The microscopic inspection of hogs has been in operation only a very short time. For the first month it cost  $20\frac{2}{3}$  cents per head, for the second  $13\frac{2}{3}$  cents per head. It is expected that the cost will shortly be reduced to 5 cents. As a result of the adoption of our inspection laws, our pork products find markets now in Germany, Denmark, France, and Italy, from all of which they were formerly excluded. The British restrictions upon the importation of American cattle have not as yet been modified.

THE TARIFF.

PRESIDENT HARRISON approved October 1, 1890, an act whose title declares that it is adopted "to reduce the revenue and equalize duties on imports and for other purposes." Thus the McKinley Bill became a law, and the famous McKinley tariff was put in operation. This tariff supersedes one provided for in an act approved March 3, 1883. The McKinley tariff contains several features which should be noticed here.

Schedule G, which in the earlier act bore the title "Provisions," now bears the title "Agricultural Products and Provisions," and provides duties on live animals, breadstuffs, farinaceous substances, dairy products, farm and field products, seeds, fish, fruits and nuts, meat products, salt, and miscellaneous products. Other schedules provide duties on wool, lumber, tobacco, spirits, wines, flax, hemp, jute, and leather. The table given below, prepared from the report of the Secretary of Agriculture for 1890, shows some of the more important changes.

Sugars are free except those above No. 16 Dutch standard in color, which pay a duty of one half cent per pound. This duty is increased

by one tenth of a cent per pound on sugars produced by or exported from a country which pays a higher export bounty on them than on sugars of a lower saccharin strength. To the American sugar-producer there is granted a bounty of 2 cents per pound on beet, sorghum, sugar-cane, and maple-sugar testing not less than 90 degrees by the polariscope, and a bounty of  $1\frac{3}{4}$  cents per pound on sugar testing less than 90 degrees, but not less than 80 degrees. The payment of this bounty began July 1, 1891, and is to continue until July 1, 1905. Machinery brought to this country to be used in the production of raw sugar from native-grown beets is admitted duty free until July 1, 1892. On the free list are jute, manila, Sisal grass, and the substances used for manure, and animals imported for breeding purposes, provided that they be pure-blooded, of a recognized breed, and are duly registered in the book of record established for that breed.

It is yet too early to show the results of these provisions, but attention should be called to the fact that the McKinley Act recognizes the farmer's claim to be taken into account in any legislation furnishing protection to our industries.

RECIPROCITY.

SECTION 3 of this act is the famous reciprocity legislation. It reads as follows:

With a view to secure reciprocal trade with countries producing the following articles, and for this purpose, on and after the first day of January, eighteen hundred and ninety-two, whenever and so often as the President shall be satisfied that the Government of any country producing and exporting sugars, molasses, coffee, tea, and hides, raw and uncured, or any of such articles, imposes duties or other exactions upon the agricultural or other products of the United States, which in view of the free introduction of such sugar, molasses, coffee, tea, and hides into the

	Old tariff.	New tariff.
Cattle .....	20 % ad val.....	{ Over 1 year, \$10. Under 1 year, \$2.
Horses .....	20 % ad val.....	{ \$30, or if value exceeds \$150, 30 % ad val.
Sheep.....	20 % ad val.....	{ Over 1 year, \$1.50. Under 1 year, 75c.
Cheese, per lb. ....	4c. ....	6c.
Eggs, per doz.....	Free .....	5c.
Wool, Classes 1 and 2, per lb.....	{ Value above 30c., 12c. .... Other.....10c.....	{ 12c. 11c.
Wool, Class 3, per lb.....	{ Value above 12c., 5c. .... Other.....2½c.....	{ Value above 13c. 50 % ad val. Other.....32 % ad val.
Barley, per bushel.....	10c. ....	30c.
Hay, per ton .....	\$2 ..	\$4.
Hops, per lb.....	8c. ....	15c.
Leaf tobacco for wrappers, per lb.....	{ Stemmed, \$1 .....	{ \$2.75. Unstemmed, 75c.....
" " Other, per lb.....	35c. ....	{ Stemmed, 50c. Unstemmed, 35c.
Potatoes, per bushel .....	15c. ....	25c.

United States he may deem to be reciprocally unequal and unreasonable, he shall have the power and it shall be his duty to suspend, by proclamation to that effect, the provisions of this act relating to the free introduction of such sugar, molasses, coffee, tea, and hides, the production of such country, for such time as he shall deem just, and in such case and during such suspension duties shall be levied, collected, and paid upon sugar, molasses, coffee, tea, and hides, the product of or exported from such designated country.

Then follow the duties: on sugar varying from seven tenths of a cent to 2 cents per pound; on molasses, 4 cents per gallon; on coffee, 3 cents per pound; on tea, 10 cents per pound; on hides, 1½ cents per pound.

This provision was intended to secure trade privileges in return for the free admission of products into this country. Under it there have been concluded treaties providing for reciprocity with Brazil, Cuba, and Porto Rico, the Dominican Republic, Salvador, Trinidad, Barbadoes, Leeward Islands, Windward Islands, British Guiana, and Jamaica, Nicaragua, Germany, and Honduras. To describe the provisions of all these treaties would require too much space. That with Brazil admits the following articles, products of the United States, free of all duties, national, State, or municipal: wheat; wheat-flour; maize and its manufactures; rye, rye-flour, buckwheat, buckwheat-flour, and barley; potatoes, beans, and peas; hay and oats; salted pork; fish, salted, dried, or pickled; cotton-seed oil; coal; rosin, tar, pitch, and turpentine; agricultural tools, implements, and machinery; mining and mechanical tools, implements and machinery, including stationary and portable engines, and all machinery for manufacturing and industrial purposes except sewing-machines; instruments and books for the arts and sciences; and railway-construction material and equipment. In addition, the following articles are admitted at a reduction of

25% from the duties provided in the tariff now in force or from any which may be adopted hereafter: lard and its substitutes; hams; butter and cheese; canned and preserved meats, fish, fruit, and vegetables; manufactures of cotton; manufactures of iron and steel not included in the former list; leather and its manufactures, except boots and shoes; lumber, timber, and the manufactures of wood, including cooperage, furniture, wagons, carts, and carriages; manufactures of rubber.

The President has suspended by proclamation the free admission into the United States of sugar, molasses, coffee, tea, and hides from Colombia, Hayti, and Venezuela.

This section may be taken as an express acknowledgment by the country that it is the duty of the National government to make it possible for the farmer to find favorable markets abroad.

#### COLLECTION AND DISSEMINATION OF INFORMATION.

AMONG the most important acts of Congress touching the welfare of the farmer are those which provide for the establishment of institutions of learning which are to give special attention to agriculture and the sciences related to it; for the maintenance of agricultural experiment stations which are devoted to the scientific investigation of agricultural problems; and for the elevation of the United States Department of Agriculture to a cabinet department. All these acts will be sufficiently noticed in other articles in this series. These three educational agencies, the colleges, the stations, and the Department, are the most important ones now at work for the betterment of agricultural matters, for nothing can benefit the farmer so much as a knowledge of the best methods of farming for the region in which he may live.

*A. W. Harris.*

### "EARTH HATH HER HURTS."

EARTH hath her hurts, but seems to lack  
Her cures; the broken heart  
Knits in its cleavage, and the back,  
Though lashed, forgets to smart.

Aye; but the loss—the main—can this  
Its crooked growth restrain,  
Till life leaps through the arteries  
And the man is a man again?

O Life immortal, hast thou skill  
To heal, and can thy gift  
Make Byron's brow serene, or fill  
The famished soul of Swift?

*John Jay Chapman.*

## TOPICS OF THE TIME.

### Responsibility for Political Corruption.

IT is the habit of many persons who deplore the existence of corruption in American politics to place the main responsibility for it upon the ignorant voters. "If we had not such a large ignorant vote, a great deal of it foreign," they say, "we should get along much better. We should not have so much money used corruptly in carrying elections, or in influencing the course of legislation." Is this an accurate diagnosis of the case? Let us consider the chief forms of corruption, and see whether it is.

To begin with national politics, the chief method of corruption is the use of large sums of money in carrying Presidential elections. A great deal of this money is used for legitimate purposes, but a great deal more of it has been used in the recent past for the direct purchase of votes. This was conceded to be the case in the campaign of 1888, when both political parties raised unprecedentedly large campaign funds, each making excuse that it must do so to counteract the other. The corrupt purpose of these rival funds was disclosed by the fact that they were raised during the final days of the campaign, when the legitimate work of electioneering had been finished. There were no more documents to be distributed, no more halls and headquarters to be hired, few or no more parades to be organized or mass meetings to be held.

Who supplied the money for those funds? Did it come from the ignorant and foreign portion of the electorate, or from its intelligent, native, and more respectable elements? It is unnecessary to answer these questions. Did not the contributors suspect that their money was to be used for corrupt purposes? If they did not, what other use did they think would be made of it? If they did suspect, why did they, as reputable citizens, upright and honorable members of society, contribute it? Simply because they had become so interested in the campaign, so desirous of partizan victory, that their moral sense was blunted to practical extinction. They shut their eyes and consciences at the same time; gave their money, asked no questions as to its use, and got ready to toss up their hats with joy at the victory which they hoped it would bring. Yet if their money went into the hands of a professional corruptionist, who distributed it among his agents, which agents went with it into the slums of great cities and bought with it the votes of ignorant and foreign-born electors, thus debauching the suffrage—upon whose head rested the responsibility? Which was the more guilty in the sight of God and man, the poor, ignorant wretch who yielded to the temptation of the man who went to him with the money in his hand, or the respectable, intelligent, honorable member of society who supplied the temptation?

Partizanship is not the only motive for such giving. Positions of honor and profit in the public service, legislation of great value to private business interests, are bought and sold in advance of election, the goods to be delivered in case of success at the polls. Here again the authors of the corruption are the men who

supply the money, not the men who are tempted to take it at the sacrifice of their honor.

When we come to State and municipal politics, we find the same evil of corruption in elections traceable to the same sources, and we find an even greater one in the buying and selling of legislation in the legislative bodies. It is a matter of common knowledge that all the great railway and other corporations, all the banks and chartered institutions which have large vested rights and interests to protect, are obliged to keep close watch by means of hired agents upon the law-making bodies of the various States, to guard themselves against hostile legislation, or to promote the passage of favorable measures. In many instances large sums of money are devoted each year to this work in the legislatures. It is disguised under some such term as "legal expenses," but the managers of the corporations and institutions who authorize its expenditure know what its purposes are. It is admitted, indeed, by many of them that the money is used for corrupt purposes, but it is claimed that such use is an absolute necessity for the protection of the property which is in their charge. They argue that so long as legislative bodies are constituted as they are at present, with venal elements frequently holding the balance of power, direct bribery is the only method for warding off injurious legislation, or securing desirable legislation.

Before inquiring as to the responsibility for this kind of corruption, let us see to what it leads. It has brought into public life a class of men known as legislative "jobbers" or "strikers." Frequently, in order to get elected, these pay sums several times as large as the salary which the office affords, their object being to get into a position in which they can traffic in legislation. They introduce measures designed to injure corporate and vested rights, in order to be "bought off" from pressing them. They organize "cliques" and "combines," and require payment for the votes of this organized gang of plunderers for or against any measure in which they think there is "something for them." These men would never have thought of going into a legislature had not the business of paying for legislation been encouraged and built up by the corporations and other aggregations of capital.

Is there any doubt about the responsibility for this kind of corruption? Does it rest upon the miserable creatures who have been attracted, like flies to offal, by the bribes offered in the halls of legislation, or upon the men of character and standing in the community who as presidents, directors, and managers of corporations and institutions furnish the bribes? What would happen if these presidents, directors, and managers, from one end of the land to the other, were to come together and declare that henceforth not a cent would they authorize for use in influencing legislation of any kind? What would happen if they were to agree that in every instance in which a demand were made upon them by a legislator or his agent for money as a price of legislation, they would make public exposure of the same, and do their utmost to have the guilty person punished? Would not the whole nefarious and demor-

alizing business disappear, and with it the legislative "jobbers" and "strikers" it has bred and nourished until they have made popular government a mockery, and the halls of legislation, in more than one instance, a den of thieves?

There has never been any corruption in politics, in any nation that the world has ever seen, in which the responsibility did not rest upon the man who offered the bribe rather than upon the man who took it. It does not lessen this responsibility if there be one or a dozen middlemen between the bribe-giver and the bribe-taker. What is wanted is a moral sense which will be as keen in political matters as it is in private and commercial matters. No reputable man ought to give a dollar for political purposes unless he can have in return an accounting for its use. Every man who contributes to a large campaign fund, to be expended by a professional corruptionist without any public or private accounting of the uses to which it is put, is an accomplice in a gigantic scheme of bribery which he has helped to make possible. Every man who contributes a penny to the blackmail levied against him, either as an individual or as a member of a corporation, is an accomplice in the systematic debauching of popular government which is in progress in the legislative bodies of this country to-day.

Why is it that it is so difficult to secure a more honest administration of the government of a great city like New York? There are many reasons, but the chief of them is not the cupidity and ignorance of the lower class of voters. Why do men not only consent to pay "assessments" to the Tammany dictators as the price of nominations for office, but why do they also consent to contribute directly to its campaign funds under fear of hostile treatment in case they refuse? An instance is within our knowledge in which the members of a firm were as individuals deeply interested in the campaign of the People's Municipal League against Tammany Hall in 1890, and as individuals were contributors to the League's fund, yet as a firm they contributed also to the Tammany Hall fund in order to be on good terms with Tammany after election. The idea that their moral obligations as good citizens were greater than their business interests did not occur to them, or, if it did, was not powerful enough to control their conduct.

Instead of being the source of our political corruption, the ignorant voter is the victim of it. If he be foreign-born, almost the first lesson he receives in American politics is that elections are controlled by corrupt men for corrupt purposes, and that the rich and respectable members of American society supply money for this work of debauchery. Instead of educating him to a high and just conception of his duties and privileges as a citizen, we are teaching him the lowest one possible. The dangerous consequences of such teaching need not be pointed out. Every instinct of patriotism, as well as every moral obligation, ought to show to every man who loves his country what his duty is in the premises.

#### A New Movement in Municipal Reform.

A FEW public-spirited young men in New York City have set on foot a project which ought to find imitators in all other large cities of the land. They have founded a City Club, composed of men who are in favor of better municipal government, and who are sufficiently

anxious to obtain it to work together for that end without regard to the considerations of national politics. It is proposed to have a club-house which, in addition to the usual accompaniments of such buildings, will have facilities for publishing and distributing documents and other educational literature. The minimum membership of 500, proposed as a beginning, was quickly reached, and the membership is approaching its first thousand. The idea is to organize ultimately the intelligence and morality of the community as thoroughly as the cupidity and ignorance of it have for years been organized by the political machines, and thus to make the former a power which shall drive the latter from the control of the government.

The alacrity with which eminent citizens of all political faiths have joined in the movement furnishes evidence, as encouraging as it is surprising, that there is an abundance of public spirit in the city which has generally been accused of having less of that quality than almost any other in the country.

But in how many other cities do the most intelligent elements of the population neglect entirely municipal affairs for the greater part of the time, taking only a brief and often misdirected interest in them for a few weeks preceding an election? The men who make politics their occupation and means of livelihood devote all their energies to the business every day in the year. They have their meeting-places, or halls, and their organization is in constant readiness for a contest. They would never make the blunder of allowing their organization to go to pieces after each election, trusting to luck to get it together again in time to carry the next election.

There is not a city in the land in which the respectable and intelligent citizens are not in an overwhelming majority. Bad municipal government in the United States, which is the almost universal rule, exists only because of the refusal of these citizens to take control of their own affairs. They allow themselves, in the first place, to be divided into two factions because of their national political affiliations. This gives the politicians who get their living out of bad municipal government their most important point of vantage: they have the enemy surely and permanently divided. Having given the politicians this advantage at the outset, the intelligent and respectable citizens give them the further advantage of refraining from all permanent organization. These are notorious facts, and it is unnecessary to dwell upon them, or upon the results which flow naturally from them.

The City Club idea is aimed directly at the two worst evils of our present system. It requires its disciples to say that they will leave national politics out of the problem, and that they will enroll themselves as members of a permanent organization, paying annual dues for its support and for the prosecution of its work, and holding themselves in readiness at all times to unite in a common movement for a common purpose. It is based on the belief that the intelligent citizen will find in civic pride an incentive to political work as powerful and absorbing as the ignorant and corrupt politician finds in the spoils of office. We do not believe that this is a misplaced confidence. There is no lack of civic pride in any city of America. It exists everywhere in constantly increasing volume, because of the shame which the scandals of municipal misgovernment are bringing upon us as a people. With proper organization it can be converted into a tremendous power for good, and

such organization the City Club idea seems surely to promise.

Every patriotic citizen, and every sympathizer with the hardships and sufferings of his fellow-creatures, ought to rejoice at an opportunity to join an organization of this character. Municipal misrule is a scandal and a shame, but its most deplorable aspect is the suffering which it causes to the most helpless portion of every city's population, the poor. It is upon them that the evil of dishonest and ignorant government bears most heavily in the end. In the model governments of cities like Glasgow, Berlin, Edinburgh, and Birmingham, it is the poor whose health, happiness, and security are most carefully provided for and protected. In many of our cities the government not merely ignores their needs, it brutally aggravates and multiplies their distresses. It does nothing to soften the hardness of their lives, but nearly everything possible to make their burdens heavier.

#### Another Word on "Cheap Money."

WITH the failure of the free-coinage bill in Congress, the danger that this country might be called upon to pass through the quagmire of a fresh cheap-money experiment seems to have been averted, for the present surely, and in all probability for a long time to come. It is apparent now that whatever of popular sentiment there may have been behind the free-silver movement at its beginning, there was very little behind it at the time of the free-coinage bill's failure, and even less at this moment than there was then. The American people have always shown great quickness in educating themselves on financial and economic questions, and the sudden subsidence of the free-silver "craze" shows that the work of education, so far as that form of cheap money is concerned, has been practically accomplished.

THE CENTURY rejoices sincerely in the assurances which have come to it from many sources that its efforts to assist in this work of education have not been unsuccessful. Now that the work is ended for the present, it may not be amiss, in taking leave of the subject in these columns, to quote a few striking passages, on the evils of cheap money, from the writings of two masters of vigorous English who studied different phases of those evils in former times. The truth of their forcible language will be all the more appreciated now, since we are coming more and more each day to a proper realization of the perils from which, as a nation, we have had so narrow an escape.

In 1722 one William Wood, a hardware merchant, obtained from the British crown a patent to coin copper money for Ireland to the amount of £108,000. He had no power to compel any one to take his halfpence, which he coined under this grant and sent to Ireland; and when a large batch of them arrived there the people refused to take and use them as money. They were made of such base metal, and were so much smaller than the English halfpence, that they were worth in gold or silver not more than a twelfth of their face-value. When the Irish people refused to accept them as money, there was talk of Wood's obtaining orders from the crown compelling the king's commissioners and collectors of customs in Ireland to take them as money, and thus force them into circulation. Upon this proposition Dean Swift, then in the full vigor of his won-

derful powers as a controversialist, published a series of pamphlets or letters addressed to the tradesmen, shopkeepers, farmers, and common people in general, on the subject of the debased coin, which made a powerful impression in both England and Ireland, and hastened the repeal of Wood's patent. These letters were signed "Drapier," and are known in the collections of Swift's works under that title. We shall make a few quotations from them with a view to showing how perfectly his arguments against the folly of debased or cheap money, made 170 years ago, apply to the proposal to inflict upon the American people a debased silver dollar worth only 70 cents.

It was urged in defense of Wood's money that copper halfpence were scarce in Ireland; that the people needed more copper money for the transaction of their business; and that if the supply were greater everybody would be more prosperous. All that sounds very familiar. It was also said, in answer to a query as to whether Wood would keep his coinage within the £108,000 limit, that he would be guided in that respect by the "exigencies of trade." That phrase also sounds very familiar. Here is what Swift says on that point:

Wood proposes that he will not coin above £40,000 unless the exigencies of trade require it: First, I observe that this sum of £40,000 is almost double to what I proved to be sufficient for the whole kingdom, although we had not one of our old halfpence left. Again I ask, who is to be judge when the exigencies of trade require it? Without doubt he means himself, for as to us of this poor kingdom, who must be utterly ruined if his project should succeed, we were never once consulted till the matter was over, and he will judge of our exigencies by his own; neither will these be ever at an end till he and his accomplices will think they have enough.

In reference to the effects of cheap halfpence on the people of Ireland, Swift said:

Mr. Wood will never be at rest but coin on: so that in some years we shall have at least five times four score and ten thousand pounds of this lumber. Now the current money of this kingdom is not reckoned to be above four hundred thousand pounds in all; and while there is a silver sixpence, these blood-suckers will never be quiet. When once the kingdom is reduced to such a condition I will tell you what must be the end: The gentlemen of estates will all turn off their tenants for want of payment, because the tenants are obliged by their leases to pay sterling, which is lawful current money of England; then they will turn their own farmers, run all into sheep where they can, keeping only such other cattle as are necessary; then they will be their own merchants, and send their wool and butter and hides and linen beyond sea for ready money and wines and spices and silks. The farmers must rob or beg or leave the country. The shopkeepers in this and every other town must break and starve, for it is the landed man that maintains the merchant, and shopkeeper, and handicraftsman. I should never have done, if I were to tell you all the miseries that we shall undergo if we be so foolish and wicked as to take this cursed coin. . . . In short, those halfpence are like the accursed thing, which, as the Scripture tells us, the children of Israel were forbidden to touch; they will run about like the plague and destroy everyone who lays his hands upon them.

Carlyle, in his "French Revolution," uses scarcely less vigorous, and even more picturesque, language in regard to the *assignats* which were issued in France between 1789 and 1796. These were in the form of paper money, based at first upon the security of confiscated church lands, and afterward upon all the national domains and other property. They were issued to the amount of over forty-five billion francs, and be-

fore they were withdrawn depreciated to less than one three hundredth of their face-value. Carlyle records that a hackney-coachman in Paris demanded six thousand livres, about fifteen hundred dollars, as fare for a short ride, in the last days of the *assignats*. In regard to the first issue, he says in the first volume of the "French Revolution":

Wherefore, on the 19th day of December, a paper-money of "*Assignats*," of Bonds secured, or *assigned*, on that Clerico-National Property, and unquestionably at least in payment of that,—is decreed: the first of a long series of like financial performances, which shall astonish mankind. So that now, while old rags last, there shall be no lack of circulating medium: whether of commodities to circulate thereon is another question. But, after

all, does not this assignat business speak volumes for modern science? Bankruptcy, we may say, was come, as the *end* of all Delusions needs must come: yet how gently, in softening diffusion, in mild succession, was it hereby made to fall;—like no all-destroying avalanche; like gentle showers of a powdery impalpable snow, shower after shower, till all was indeed buried, and yet little was destroyed that could not be replaced, be dispensed with! To such length has modern machinery reached. Bankruptcy we said was great; but indeed Money itself is a standing miracle.

The miracle of the *assignats* consisted in creating what appeared to be something out of nothing; but it returned in due season to nothing, leaving ruin and desolation behind it.

## OPEN LETTERS.

### The Disputed Picture in Sparks's "Washington."

IN THE CENTURY for February, 1892, Mr. Charles Henry Hart undertakes to "refute" what is stated in my volume, "George Washington and Mount Vernon," concerning the error of Sparks in publishing a portrait of Washington's sister as that of his wife. But Mr. Hart, in his comparative study, deals with the wrong picture! He contrasts the Sparks engraving with a picture from Clarke County shown in our Centennial Loan Exhibition in 1889. Although to me it is plain that the exhibited picture was meant for the same person as the Sparks picture, it is a wretched daub, and looks like some local artist's attempt to paint Betty Lewis in advanced age with the dress of her early portraits. However this may be, it is aside from the issue. The portrait to be compared with the supposed Martha Washington is the unquestionable Betty Lewis at Marmion, of which an engraving appeared in THE CENTURY for April.

A satisfactory comparison cannot, however, be made between the two engravings. The Sparks engraver has made the lady much younger than she is in the original, and has slightly rearranged her beads, so far as I can judge from a blue photograph of the original now before me. On the other hand, the Marmion lady appears older in black and white than in the original, which is represented in New York by a full-sized copy, made many years ago by a competent artist for the late Captain Coleman Williams, one of the Lewis family. Since seeing the picture in the April CENTURY, I have closely compared the pictures again, and believe the only important difference between the undisputed Betty Lewis and the supposed Martha Washington is in a slight rearrangement of hair over the forehead. In the originals the two appear to be of the same age, and the portraits were probably taken successively, Colonel Fielding Lewis ordering one picture of his bride for himself, another for her brother. In order to show that they were not replicas, the artist has altered the hair slightly, and some few details; the flower held in the right hand is changed, and the figure, standing in one case, is seated in the other. If Mr. Hart will call on me, he shall be shown the copy of the Marmion portrait beside the Sparks picture, and a photograph from the original represented by the latter. I do not doubt that he will

be convinced that, unless they be the same, no two unrelated ladies ever so miraculously resembled each other, or dressed so alike, even to the loops of the bow-knot at the breast, and ribbons floating out in the same way. I think, too, that Mr. Hart will admit that nothing less than a miracle could transform the lady of the Sparks picture, especially as seen in my photograph from the original, into the Mrs. Washington by Charles Willson Peale reproduced in his article in the February CENTURY.

It is not necessary for me to venture any theory as to the origin of the error in Sparks; but having some Virginia sentiment concerning the families connected by Mr. Hart with the matter, who are placed as I think in a false position, I must question the authenticity of his statement that G. W. P. Custis and Mr. and Mrs. Lawrence Lewis are responsible for the publication in Sparks. If indeed they believed the portrait to be that of Martha Washington, they may have got the notion from the book of Sparks, who might have got it from a negro housekeeper. None of them could remember Betty Lewis or Mrs. Washington at so early an age as that of the portrait, and they might easily have been misled. But were they misled? Mr. Custis does seem to allude to this portrait as that of his grandmother, but evidently had no definite knowledge about it. He says it was painted in 1757—the terrible year in which Martha Custis, after the death of her two children, saw her husband sinking into the grave. Is it to be supposed that then, or in any of those years of affliction, this bereaved mother and widow was painted in *décolleté* costume, and gayest colors, as shown in the original of the Sparks picture?

In 1855 Colonel Lewis Washington, who pointed out the error in Sparks, made a careful investigation of all the family pictures, and corresponded with Mr. Custis on the subject. In a letter to Colonel Lewis Washington (August 4, 1855), Mr. Custis speaks of the "majestic" Betty Lewis, and adds, "There is a good portrait of her." To what portrait did he refer? Certainly not to the wretched daub with which alone Mr. Hart has compared the Sparks picture. No sane man could describe that as good, or its subject as majestic. Mr. Custis could hardly mean Colonel Lewis Washington's own picture of Betty Lewis. The "good portrait" may have been that at Marmion, whose characteristics he might

not remember. Or, finally, Mr. Custis may have been convinced in 1855, when Colonel Lewis Washington called his attention to the matter, that the portrait at Arlington, which Sparks had engraved, was that of Betty Lewis.

*Moncure D. Conway.*

#### A Word More on the Distribution of Ability.

IN the abundant comment upon the article about "The Distribution of Ability in the United States" which appeared in the September CENTURY, much criticism was mingled. To reply to this criticism in detail would be needless, and would occupy too much space. But all of it, I think, can be met by a few general statements, and the more easily as most of it proceeds from a misapprehension of the original inquiry and of the system upon which it was conducted.

In the first place, I did not create the statistics; I merely collected them, and they are as free from error as it is possible to be in tallying and classifying over fifteen thousand names. I should have been glad to give figures which would have gratified every one's local and race sensibilities; and if I had been making up the lists as a work of the imagination solely to please myself, I should not have reached the conclusion that Connecticut among the States and the Huguenot French among the race stocks showed the highest percentage of ability. I gave the results exactly as I found them, and had no idea what they would be until all the names had been tallied, classified, and finally counted.

Another criticism has come from a failure to recognize the plainly stated system upon which the work was done. I adopted, for instance, a certain race classification. It is perfectly fair to criticize that classification as such, but it is absurd to say that I have misrepresented facts because the results of a different classification are not the same as mine. For example, I classified the Irish and the Scotch-Irish as two distinct race stocks, and I believe the distinction to be a sound one historically and scientifically. It is possible, of course, to take another view of this arrangement of races, and perhaps to defend it. But to add a large part of the Scotch-Irish to the Irish, as one of my critics has done, and then to accuse me of misrepresentation because his result based on one classification differs from mine based on another and entirely different one, is unfair and meaningless, and does not touch my conclusions. The Scotch-Irish from the north of Ireland, Protestant in religion and chiefly Scotch and English in blood and name, came to this country in large numbers in the eighteenth century, while the people of pure Irish stock came scarcely at all during the colonial period, and did not immigrate here largely until the present century was well advanced. There seems no good reason why a people who were not here except in very small numbers should perform the impossible feat of producing more ability than races which were here and which outnumbered them many times. In the table of persons born in the United States the number of pure Irish stock is small because there was very little of it. On the other hand, in the emigrant table, which represents ability after the Irish movement began, the Irish stand high. The Scotch-Irish and Huguenots show the reverse. They stand very high in the tables of persons born here, and almost disappear in the emigrant table. In

other words, the figures correspond, as they ought, with the facts of history and with the race movements.

The same principle holds true in regard to States. Communities cannot begin to produce native-born ability until they have been in existence as communities for at least the lifetime of one generation. For this reason the total amount of ability becomes less as we pass from the old thirteen States to those founded just after the Revolution, and thence through the different stages until the newest States are reached, where practically nothing is shown in the tables, simply because there has not been time for men and women to be born and to grow to maturity, and the active and able part of the population has of necessity come from outside. The criticism that birthplace should not be the test for the classification by communities seems hardly to require an answer, for a moment's reflection ought to convince any one that no other is practicable. Place of birth is no test of race, although it may be an indication, but it is a test for determining the community which produced a given man or woman. If we attempt to credit a person to the community in which he grew up or was educated, or in which he achieved his reputation, our only guide is discretion, and the classification could be disputed in every instance. The place of birth may sometimes be misleading as to the community which really produced a man or woman, but these errors are comparatively few; they balance, or tend to balance, one another, and the test itself is not open to dispute and is not a matter of personal discretion.

In addition to these general points, there is one specific objection which I wish to meet. Some of my critics said that it was not surprising that New England and New York showed such high figures, because "Appleton's Cyclopædia of National Biography" was a Northern and Eastern publication, and its editors were a New-Yorker and a New-Englander. It was intimated that if the "Cyclopædia" had been edited and published elsewhere, and by other persons, the result would have been different, and that the place of publication and the unconscious bias of the editors had given the States which showed the best results an undue advantage. This criticism was susceptible of a test which I have accordingly made. In regard to American ability the "Encyclopædia Britannica," whatever its merits or defects otherwise, is at least a disinterested witness, unswayed by either the State or race partialities of the United States. In the index of the "Encyclopædia Britannica" I find 317 names of Americans, who are not merely mentioned in lists, but of whom some account is given either under their own names or in connection with some general subject. Of these at least 250 would be placed without dispute among the 300 most distinguished Americans. Of the remaining 67 the right of some to be in the list would be disputed, while that of others would be rejected, by American judges. These last names, however, whether removed or left in, are so divided among races and States as to make no difference in the general result. These 317 names, therefore, selected by an entirely outside authority, I have classified and arranged just as I did those in the original article, and the results are given below. These tables explain themselves. It will be seen that they not only confirm the general trend and results of the Appleton tables, but accentuate the differences among the States shown by the latter, and fully sustain the conclusions of the original article.

H. C. Lodge.

Note on "The Distribution of Ability."

THE writer of "The Distribution of Ability in the United States" has omitted to mention one circumstance which strikes me as a very material one. Be one's ability what it may, it is the pen alone that can confer upon him even the immortality of the biographical dictionary. Nearly all the writers and chroniclers of the country have been Northerners, and largely New-Englanders. As a consequence, local prominence, of whatever sort or degree, stood a much better chance there of falling in the way of the encyclopedia-maker, than if achieved among a people with whom literature was by far the most backward of all pursuits.

It has been said that a happy people have no history. It is self-consciousness and discontent, rather than naturalness and cheerfulness, that fill the libraries. Thus the Southerner, I opine, has come to be a maker of books.

But this is somewhat from the point. It is of course impossible even to estimate the effect of a State's backwardness in literature on the fame of her sons. That it must have some weight the author of the article mentioned will, I am sure, admit. Sallust said of the Athenians:

The exploits of the Athenians doubtless were great; and yet I believe they were somewhat less than fame would have us conceive of them. But because Athens abounded in noble writers, the acts of that republic are celebrated throughout the whole world as most glorious; and the gallantry of those heroes who performed them has had the good fortune to be thought as transcendent as the eloquence of those who have described them.

David Dodge.

## IN LIGHTER VEIN.

Aunt Lucretia's Libretto.

MANY people who travel find their greatest enjoyment in the surroundings which remind them of home. This was the case with Mrs. Lucretia Moore. She was a resident of a small town in eastern Maine, and one fall,

who was listening for the second time to a description of "the feller that was the livin' image of Caleb Sprowl," "if you set so much on the looks of Caleb Sprowl, I don't see no reason in your leavin' home. Did n't you see no churches nor hear nothin' except jest what we can see here right along?"

"LAND, MRS. MOORE!"

greatly to the surprise of her neighbors, she announced her intention of visiting a niece who lived in Boston.

"I've got all wore out seein' the same folks from year's end to year's end," she said, "and I'm a-goin' where I sha'n't see a cow nor a neighbor fer a good spell."

Aunt Lucretia was warmly welcomed. She was taken to see Bunker Hill Monument (which was not as tall as she expected), to the new Public Library, the Art Museum, and to all the noted churches in the city.

Still the old lady did not seem to be well entertained. She expressed no admiration and but little surprise. Indeed, her manner, so far from being that of a country-woman who had never been beyond the limits of her native town, was *blasé* and indifferent in the extreme.

One afternoon she went with her niece to see "The Old Homestead." She evidently enjoyed it, and that evening had a great deal to say about the play.

"There, that play was the most natural thing I've seen since I left home," she said in a satisfied tone. "I jest wish I could remember what that old feller's name was that looked so much like Caleb Sprowl," and the old lady chuckled reminiscently. "If any of you are calculatin' to take me round any more, you can take me to see that piece again. I don't want to urge it upon you, but I should be perfectly willin' to go 'most any time."

Upon her return home, Aunt Lucretia had but little to say of her visit. But to each inquiring neighbor she would relate, as nearly as she could recall them, the different scenes in "The Old Homestead."

"Land, Mrs. Moore!" finally exclaimed an old lady

"Of course I did. I see all there was to see, went to a fair and a picture-show, and nigh about wore myself out. But, there, 't was n't what I expected, and I did n't expect 't would be; so when Maria took me to see that show I jest begun to feel to home and enjoy myself. I don't s'pose 't will be likely to get so fur east as this, but if it should, I'd be willin' to pay Caleb's fare in jest so he could see how he looks in that old linen duster. I'd give considerable to know that old feller's name; but I came off 'n' left my libretto that had the names printed on it, and I can't seem to recall it."

Alice Turner.

### The Touch of Spring.

I HEARD, as the wind went by me,  
A breath, or was it a sigh?  
Something too vague for rhyming,  
Too tuneless for melody.

Light—lighter than moth-wings floating,  
And yet, as it swept along,  
It wrote on my heart a poem,  
And drew from my soul a song.

Mary Ainge De Vere.

### Could n't Get By.

I TRIED to climb Parnassus high,  
But gave up in despair;  
For at the foot 't was crowded by  
The asses grazing there.

John Kendrick Bangs.

## In the Wintergreen Patch.

ONE morning, ere springtime was yet on the wane,  
While the opals of dew gemmed the grass in the lane,  
Where the woodland was weaving its sheltering thatch  
I found, as I strayed, a fine wintergreen patch.

And there was a maid, in no finery tricked,  
Whose lips were as red as the berries she picked,  
Whose eyes had more blue than the lupine could hold,  
And whose hair had the glint of the buttercup's gold.

She smiled, and my feet, as if spellbound, must stop,  
While my foolish old heart seemed to buzz like a top;  
She spoke, and the words, as they fell from her tongue,  
Had more charm than the song that the hermit-thrush sung.

Her hands were so slender, her fingers so white,  
To watch their swift play was a dream of delight.  
Who can foil Madam Fate? There was naught could  
avail;

I was tranced by each berry that dropped in the pail.

There 'll be wedding-bells soon, and the fair bride will  
wear  
Some wintergreen sprays in the coils of her hair;  
And the berries that shine on her sweet lips will  
match  
The reddest she plucked in the wintergreen patch.

*Clinton Scollard.*

## A Lucubration.

HE held a firefly to the page, and read  
Ten lines of Homer by the light it shed.  
Released, it went upon its shining way—  
A wiser firefly? Ah! let sages say.

*Edith M. Thomas.*

## A Man's Woman.

SHE is not sweet, the woman that I love;  
Nor is she fair,  
Nor wise in any lore which books can tell,  
And yet she knows the secret of a spell  
From feet to hair.  
Ah, no! not wise, the woman that I love.

She is not fair, the woman that I love;  
Nor is she wise,  
Nor sweet, and yet she speaks from feet to hair,  
With turn of waist and throat, and I am there,  
Held in her eyes.  
Ah, no! not fair, the woman that I love.

She is not wise, the woman that I love;  
Nor is she sweet,  
Nor fair. The spell she weaves, is it of sense?  
'T is undefined and subtle, yet intense,  
Flame without heat.  
Ah, no! not sweet, the woman that I love.

Not fair, nor sweet, nor wise, is she I love.  
Beyond a name,  
Incarnate mystery of negatives;  
Unsolved, unsolvable, a spell which lives,  
Elusive flame,  
And which she is — the woman that I love.

*Margaret Sutton Briscoe.*

## Love's Flitting.

WHEN Love is coming, coming,  
Meet him with songs and joy,  
Bid him alight and enter,  
Flatter and feast the boy;  
Crown him with gems and roses,  
Charm him with winning wiles,  
Bind him with lovely garlands,  
And kisses, and smiles.

When Love is going, going,  
Leaving you all alone,  
Craving, the fickle tyrant,  
Some newer slave and throne,  
Hinder him not, but quickly,  
Even though your heart may bleed,  
Saddle a horse for his journey,  
And bid him God-speed!

*Elizabeth Akers.*

## The Promoter.

'T is said a wizard in the days of old  
Converted all base metals into gold;  
The modern alchemist, beyond dispute,  
Can all your gold into thin air transmute.

*Samuel R. Elliott.*

## To the Lamp-post!

REVIEWERS must live, one supposes,  
For they most incontestably do.  
They thrust out the thorns on our roses,  
They teach us to turn up our noses,  
They prove that far older than Moses  
Are the things we thought charmingly new.

Perhaps 't is all in their vocation,  
Perhaps they would starve, did they not;  
But one thing demands legislation,  
One criminal, extermination,—  
Or, at the least, expatriation,—  
The reviewer who tells us the plot.

When life, though we patiently take it,  
Is often so bitter a pill;  
So acid a draught, though we shake it,  
And strive effervescent to make it,  
May we not, for a moment, forsake it  
By losing ourselves in a thrill?

If mystery veil the last pages,  
We can live in the heroine's life,—  
Or the hero's,—can rage when he rages,  
Can fight in the battle he wages,  
And come, by his various stages,  
Triumphantly out of the strife.

But when, before even beginning,  
We know what the end is, how tame  
Becomes the amusement—the spinning  
And weaving employed for our winning  
Seem visibly shrinking and thinning;  
And for this is the author to blame?

No! Perish the heartless reviewer  
Who mars that which make he could not!  
Let him give, for the old, something newer;  
Let him give, for the false, something truer;  
Let each reader become his pursuer —  
This wretch who bewrayeth the plot!

*Margaret Vandegrift.*

## AN ASCENT OF FUJI THE PEERLESS.

Thou hast a voice, Great Mountain, to repeal  
Large codes of fraud and woe; not understood  
By all, but which the wise, and great, and good  
Interpret, or make felt, or deeply feel.

Shelley's lines are true for Mont Blanc, they must, *a fortiori*, be true for Japan's great sacred mountain, Fuji-san. All mountains in the Mikado's empire are revered, but "Fuji the Peerless" preëminently.

Rising on all sides with a majestic sweep from the plains of Suruga and Ko-shiu, the symmetric cone of Fuji, in figure nearly ideal, attains an elevation of 12,500 feet above the sea.

All the mountains of Japan are of unquestioned volcanic origin, and Fuji stands where Hondo, the main island, is broadest. About twenty craters are still active throughout the islands, but Fuji-san belongs to the much greater number which are now inactive. Its last eruption occurred in 1707, continuing more than a month. As far away as Tōkyō, sixty miles northeast, the ashes fell to a depth of seven or eight inches; while on the Tokaido, twelve or fifteen miles southeast, the accumulation was six feet. At this time was

formed Ho-yei-san, a secondary or parasitic cone on the southeast slope.

No other mountains in Japan reach within three thousand feet of the elevation of Fuji, and it is therefore in prominent view from an immense area, including thirteen provinces of the empire. Certain avenues in Tōkyō are called Fuji-mi, or Fuji-viewing streets, and from all of them the famous peak is a glorious spectacle.<sup>1</sup> All winter long the summit of Fuji-san is unapproachable, and from November to July snows reign supreme. In the latter month, however, when the trails up the mountain slopes are laid bare, the ascent becomes feasible, and remains so throughout the summer and early autumn.

Our interest in ascending Fuji was not that of the tourist, merely to say that he had been to the top; nor of the Japanese pilgrim, to pay vows at the shrine of the adorable goddess Kono-Hana-Saku-ya-Himé; nor yet of the poet, who, if he wish still to venerate the lofty eminence, had better stay below; but of the scientist purely, and for the purpose of making sundry observations bearing upon the perma-

<sup>1</sup> Fuji-no-yama, Fuji-san, Fujiyama, Fusiyama, and Fuji plain and simple—all are designations of the far-

famed peak in frequent usage. Fuji-no-yama and Fuji-san are preferable orthography.

ment occupation of such peaks for astronomical purposes.<sup>1</sup>
